INDEX OF CONTENTS.

JULY TO DECEMBER, 1892.

A

АВАСАБИ Pine-apples, 45
 Abies Veitchii, 399
 Abbotsbury, Dorset, 679
 Abies amabilis, 770; A. bracteata, 770; A. grandis, 218
 Acantholimon venustum, 246
 Acanthorhiza aculeata, 729
 Acids of fruits, 14
 Æsculus, 651
 Æsculus hippocastanum, 586
 Agricultural depression, 797
 Agricultural Research Association, 132
 Agriculture, tropical, 649
 Alkaloids in plants, 344
 Allamanda Hendersonii, 794
 Allerton Beeches, near Liverpool, 432
 Alpine plants, new, 399, 614, 651
 Alpines, and the use of aphanium, 7
 American fruit, poisons on, 64
 Amorphophallus campanulatus, 38
 Androsace caucasica, 399
 Anemone japonica, crimped leaf of, 219
 Angraecum sesquipedale, 123
 Anguloa uniflora var. eburnea, 534
 Ant-bear, the, 469
 Apiary, the, 41, 99, 185, 243, 339, 407, 465, 615, 735
 Apple, Beauty of Nordhansen, 732; Biela Borodowka, 124; Ceska Pochontka, 124; Domneschta, 124; Keswick Codlin, 346; Lord Grosvenor, 162; Margil, 616; New Red Raspberry, 124; Saltmarsh's Queen, 248; Sandringham, 616; trees in heavy soils, 499; insects which infest, 530, 565
 Apples, 651; and Pears (market), 366
 Apples, Canadian, 532; at Maiden Erleigh, 333; for cider-making, 528; from Belgium, 619; hardy, 65; in Staffordshire, 472; on Pear trees, 562; scale of sizes for, 568
 Apple-tree leaves, composition of, 795
 Apricots, Conference on, 311
 Arboricultural Society, Royal Scottish, 38
 Aristolochia elegans, 74; A. gigantea, 341; A. gigas, 130
 Assessment, inquiry, 219; of green-houses, 408, 768
 Aster alpinus var. albus, 15; A. trinervius, 309
 Athyrium, a new, 301; A. filix-femina, 708
 Auricula, the, 67, 583
 Azalea rosaflorea, 69

B

Bamboo, stakes, 532; the Giant, 302
 Baobab, the use, 775
 Barham Court, 727
 Bauhinia grandiflora, 706
 Begonia, double-flowered tuberous, 366, 429; leafy, 15
 Begonias, 244; and sub-tropical plants, 407; at Forest Hill, 344; conference on, 311; under trees, 499
 Birchleaves, plan of garden at, 440

Belgian note, 406
 Benary's nursery, Erfurt, 344
 Benefit and Provident Society, United Horticultural, 71
 Berberis Darwini as a hedge plant, 104
 Berlin florists, 614
 Berlin letter, 614, 640, 700
 Bethnal Green, a flower show at, 278
 Blenheim Orchids, sale of, 768
 Blithfield Hall, 487
 Bodnant, 332
 Boehmeria nivea, 188
 Boissier Herbarium, 649
 Bones as a building material, 620

BOOKS, NOTICES OF:—Agricultural Gazette of New South Wales, 438; Agricultural Grasses, 708; Agricultural Record (J. H. Hart, Trinidad), 438; Animals' Rights (H. S. Salt), 708; An Introduction to the Study of Botany (A. Dendy and A. H. S. Lucas), 708; Annals of Horticulture (Prof. L. H. Bailey), 438; Application of Artificial Manure to Fruit and Vegetables Growing, and in Flower and Garden Cultivation, 16; Australian Fungi (Dr. Cooke), 438; Beneath Helvellyn's Shade (Samuel Barber), 676; Book about the Garden (Dean Hole), 217; Botanical Magazine, 15, 71; British Fungi (G.  Bullen, the late Mr. R., 500
 Burford Lodge, 377

C

CALABRIA, vegetable products of, 649
 Calanthes at Bicton, 696
 Calanthe oxalate in the bark of trees, 794
 Calcutta, 181
 California as a home, 12; Grape-

growing in, 794; Prune industry in, 619
 Californian notes, 274
 Calochortus, a double, 740; C. amoenus, 11; C. Kennedyn, 592; C. venustus Vesta, 105
 Campanula pyramidalis, 219; C. Waldsteiniana, 193
 Campanulaceæ, rare alpine, 238
 Camphor trade of China, 272
 Canadian Apples, 532
 Canford Manor, 73
 Caralluma campanulata, 369
 Carludovica microcephala, 592
 Carnation Marguerite, 378
 Carnations, 584; and Picotees, 67; as exhibition flowers, 289; tree, 733
 Carrots, the colour of, 45, 74
 Castle Levan, garden view at, 468
 Catalpas, 246
 Catasetum longifolium, 582
 Cattleya Aeklandiæ, 534; C. Alexandriæ, 672, 730; C. amethystoglossa, 534; C., a new, 270; C. × Arnoldiana, 534; C. aurea, 309; C. Brymeriana, 336; C. gigas, peloria of, 161; C. Hardyana var., 240; C. Leopoldii, Pernambuco variety, 760; C. Loddigei O'Brieniana, 11; C. Mendel, 365; C. Mendel, Empress of India, 36; C. Mendel, Mrs. Brooman White, 92; C. Mossia Wagneri, 36; C. Warscewiczii (gigas), 36
 Cambridge Botanic Garden, 45
 Cedars, Banbury, the, 157
 Cedars, The, Harrow Weald, 105
 Celery culture, the new, 367; earthing of, 492
 Cerastium purpurascens, 399
 Cercopis apumaria, 585
 Cerise à courte queue, 620
 Certificates at Chiswick, 341; of the Royal Horticultural Society, 375, 409, 440
 Ceylon, 38
 Chamædorea, 592
 Cheiranthra parviflora, 469
 Cherry, a short stalked, 620; Frogmore Bigarreau, 104
 Chicago Exhibition, 160, 309, 310, 732
 China grass, 160
 Chiswick certificates, 311; conference at, 244; gardens, 308
 Christmas Roses, 796
 Chrysanthemum grafting, 472; box and stand, 521; C. carinatum, 670; cuttings, 670; C. Jno. Lambert, 771; jottings, 535, 553, 586, 641; C. maximum, yellow hybrid of, 711, 797; C. Mr. S. Coleman, 771; show boards for Japanese, 365; sports, 733, 797; the, 590
 Chrysanthemums, 211; and asphalted paths, 591; at Amsterdam, 675; at Biddick Hall, 679; at Hillwood, 771; at New York, 698; damping off of the blooms of, 169; dwarf, 67; grafted on Pyrethrum frutescens, 699; in groups, 581; hints on exhibiting, 536, out-of-doors, 678; show stands for, 591

- Cider making, 528
 Cineraria and *Calceolaria* in winter, 713
 Cinerarias, 23
 Cion or acion, 706, 743
Cirrhopetalum Medusae, 123
 Cleistogamy, 398
Clerodendron Balfourianum, 11
 Clover, red, in New Zealand, 309
 Coal-tar as a safeguard to young trees, 19
 Cochineal in Teneriffe, culture of, 396
Cœlogyne cristata, 24; flowering twice in one year, 123
Coffea speciosa, Marogogepie, 740
 Coffee in British Honduras, 619
 Cola, 761
Colchicum autumnale, some new forms of, 471
Colea tuberosus, 729
 Colour in flowers, distribution of, 91
 Columbian exhibition, 460, 532
 Combermere Abbey, 363
 Commerson, Philibert, 89, 125, 207
 Conference of the Royal Horticultural Society at Chiswick, 244
 Conifer notes, 368; report, the, 742
 Co-operative production, 216
 Co-operative show at Crystal Palace, 276
 Cooper, Ed., the late, 218
 Copper compounds and the Potato disease, 531
 Cordon training, 640
Coronilla cappadocica, 399
Coryanthes macrocorys, 396
Coelus igneus, 712
 County Council experiment stations, 739, 740; horticulture, 136
 Covent Garden, Christmas supplies at, 768
 Cranbrook Gardeners' Society, 795

 Currant fungus, 44
 Currants, hybrid, 219
 Cut flowers, trade in, 74
 Cycada at Kew, 496, 729
Cyclamen seed, 650
Cycnoches chlorocheilon, 11
Cypripedium in tropical Africa, 156
Cypripedium Albertianum, 672; *C. Ashburtonæ* var. *Lauchiana*, 11; *C. callosum* var. 270; *C. Castellanum*, 534; *C. Chamberlainianum*, 730; *C. (hyb.) Eyermannianum*, 11; *C. hybridum Spicerianum* × *hirsutissimum*, 712; *C. hybridum Maynardii*, 123; *C. h. Pollettianum*, 123; *C. orphanum*, 582; *C. Pitcherianum* ×, 582; *C. speciosa*, 270; *C. Youngianum*, 161
Cyrtanthus Tuckii, 155, 189
Cyrtopodium punctatum, 396
- D**
- DAFFODILS, 380; Hartland's White Trumpet, 649
 Dahlia, the, 584
 Dahlias, 273, 526
 Dalmeny, 787
 Damper, automatic, 46
Daphne Genkwa, 702
 Darwin medal, the, 676
 Davenham Bank, Malvern, 712
 Dawpool, 523
 Delphiniums, 408
 Delrow, Aldenham, 430
Dendrobium ciliatum, 582; *D. nobile Cooksonianum*, 334; *D. Macarthia*, 672; *D. Phalænopsis*, 533; *D. Phalænopsis Schroderianum*, 459; *D. P. Schroderianum*, a peloriate flower of, 468
Dendrocalamus sikkimensis, 675
- Devon and Exeter Gardeners' Association, 444
 Dew, and its action on plants, 18, 161, 219, 248, 281
Dianthus, single-flowered, 47
Digitalis, proflerons, 309
Diospyros kaki, 712
Disa tripetaloides, 36
Dischidia Rafflesiana, 619
 Displacement and simulation, 218
 Doctor's garden, our, 270
 Dover House, Roehampton, 557
 Downie, Jno., the late, 706, 771
 Drainage, 526
 Dublin Botanic Garden, 33; tercentenary, 42
 Dundee, exhibition of native and garden flowers at, 45
 Dupplin Castle, 325, 564, 594
 Dyer, Bernard, 43
- E**
- EALING Gardeners' Association, 444
 Earl's Court Exhibition, 349
 Earthquakes, effects of, on vegetables, 161
Echinocactus myriostigma, 789
 Edge Hall, 395

 Edinburgh, nurseries at, 774
 Egg plant, 770
 Electric heating, 309, 795; light for forcing, 214, 466
 Electric light and Lettuce growing, 311
 Elm tree, a notable, 471, 531
 Emigration, 44
Epidendrum Wallisii, 396
Epiphyllum Makoyanum, 161
Erica Wilmorei, 132, 222
Erigeron mucronatum, 461
Eucalyptus, at high altitudes, 728; *E. globulus*, 408
Eulophiella Elisabethæ, 36
Euonymus europæus, 702, 742; *E. japonicus aureo-marginatus*, 238
 Evergreens, transplanting of, 189
Exochorda grandiflora, 238
 Exports (see Stocktaking).
- F**
- FAN Palms, West Australian, 735
 Fan-training, in praise of, 280
Farfugium grande, introduction of, 139
 Ferment in gourd, 216
 Fernery, a British, 240; at L'Horticulture Internationale, 373
 Ferns at Kew, 639; British, under glass, 272; dwarf, British, 9; variegated, 334
 Fibre, Henequen, in Yucatan, 401
 Fig, cultivation of, 614
 Figs at Chiswick, 304
 Firs, Warwick, the, 613
 Floral, decoration in the dwelling, 16; horology, 214
 Flower formation, 103
 Flower garden, the, 13, 40, 68, 98, 129, 157, 185, 213, 243, 275, 306, 339, 371, 402, 435, 465, 495, 527, 559, 588, 616, 645, 973, 703, 734, 764, 790
 Flower shows, children's exhibits at, 190; use and abuse of, 187
 Flower, when ought plants to, 161
 Flowers, colour in, 91: in season, S. Devon, at Christmas, 798; marketing of, 104; packing, 532
 Fog annihilator, the, 648
 Forestry, 41, 184, 377, 614, 698, 765
 Foxgloves, 345
Freesias, from seed, 246
 Frog-hopper, the, 585
 Frosts, effect of the, 16; in Scotland, 410; recent June, 47
 Fruit crops, 219, 220; reports of, 16, 93, 100; remarks upon the, 133, 153, 182, 208
- Fruit, culture and allotments, 674; drying, 308, 346; evaporated, 497; growing for profit, 19; newly-planted and pruning, 46; on walls, watering of, 408; show at Earl's Court, 216; supply, colonial, 130; trees on north walls, 523; trophy at Lord Mayor's Show, 592; wired walls for, 63
 Fruits, acids of, 14; and vegetables, new modes of disposing of, 677; canned and preserved, 19; sourness of, 159
 Fruits under glass, 13, 41, 68, 99, 129, 157, 184, 213, 242, 274, 306, 339, 370, 403, 435, 465, 494, 526, 558, 589, 616, 644, 673, 702, 734, 764, 791
 Fruits under many names, 736
*Fuchsia*s, white-flowered, 310
 Fungoid diseases and copper-dressing, 103
Furcraea, alias *Fourcroya*, 186
 Furnishing in Berlin, 640
- G**

PLANTS, NEW OR NOTEWORTHY.

DESCRIBED:—Agapetes Mannii, 364; Agave Franzosini, 179; Albica Buchananii, 488; Aspasia Barclayii, 364; Asystasia varia, 760; Bulbophyllum densiflorum, 150; B. O'Brienianum, 332; Calanthe Sanderiana, 396; Cattleya Batalini, 332; Cirrhopetalum Thouarsii, 178; Cœlogyne flexuosa, 364; Colchicum Decaisnei, 458; Costus unifolius, 696, 789; C. Englerianus, 789; Casparia undulata, 396; Cymbidium flabellatum, 8; C. Humboldtii, 8; Cyrtopodium Editbae, 458; C. Henryii, 364; C. pusillum, 364; Cyrtopodiums, new hybrid, 391; Cyrtosperma ferox, 123; Dendrobium chrysocephalum, 122; D. Phalaenopsis Fitzger. var. Rothschildiana, 668; D. platycanlon, 150; Disa Cooperi, 268; D. Stairsii, 728; Epidendrum bituberculatum, 364; Eria cristata, 151; Habenaria carnea, 300; Hebenstretia comosa serratifolia, 34; Kalanchoe marmorata, 300; Lepanthes gracilis, 364; Lilium Davidii, 613; L. Delavayi, 613; L. Dachartrei, 613; L. Fargesii, 613; L. formosum, 613; L. Iankongense, 613; L. mirabile, 613; L. myriophyllum, 613; L. ochraceum, 613; L. oxypetalum, 613; L. papilliferum, 613; L. sutchuenense, 613; L. taliense, 613; L. Thomsonianum, 613; L. yunnanense, 613; Lycopodium Mooreanum, 582; Marica occidentalis, 150; Masdevallia Harryana Gravesia, 122; Maxillaria glumacea, 364; Miltonia Clowesii gigantea, 552; Nemesia strumosa, 269; Odontoglossum auriculatum, 151; O. guttatum, 151; O. Owenianum,

178; O. platycheilum, 35; Oncidium cristatum, 364; O. Rolfeanum, 34; O. Saintlegerianum = spilopterum, 582; Peperomia inquilina, 428; Pleurothallis atenosepala, 364; P. subulata, 150; P. teretifolia, 521; Pseudo-macodes Cominsii, 151; Restrepia bidentata, 364; R. ecuadorensis, 150; R. Shuttleworthii, 150; Rhododendron racemosum, 62; Spiranthes olivacea, 151; Vanda vitellina, 206; Vanilla ensifolia, 151; Zygopetalum graminifolium, 179

PLANT PORTRAITS. Register of:—

Acacia dealbata, 73; Acer rubrum var. Drummondii, 73; Aërides Lawrenceæ var. Amesiana, 708; A. Ortgiesianum, 708; Aganisia ionoptera, 796; Agave Salmiana, 650; Alloplectus Lynchii, 796; Amelanchier canadensis, 796; Amygdalopsis Lindleyi, 161; Anthurium Andreanum var. Wambekeanum, 708; A. atrosanguineum, 99; Apple The Queen, 73; Ascyrum crux Andreae, 46; Asplenium montanum, 99; Aubrieta grandiflora, 374; Azalea Helix, 310; A. indica Germaine Pynaert, 188; Begonia Haageana, 46; B. semperflorens atropurpurea, 470; Bignonia speciosa, 470; Boltonia latissuama, 46; Bomarea frondea, 188, 246; Bulbophyllum anceps, 676; Calceolaria Pinie d'Or, 46; Callistemon rigidus, 46; Calochortus Kennedyi, 650; Canna, Madame Joanni Sallier, 708; Capparis flexuosa, 188, 246; Carludovica microcephala, 650; Caryopteris Mastachanthus, 161; Catasetum Lichtensteini, 708; Cattleya Alexandrea, 46; C. aurea var. chrysoctoxa, 650; C. autumnalis, 246; C. Dowiana var. Statteriana, 796; C. Hardyana x var. gardeniana, 796; C. Mossiae vestalis, 99; Cercis Siliquastrum, 533; Chamadorea atolonifera, 650; Chimonanthus fragrans, 161; Cochlioda Noetzliana, 73; Cœlogyne lactea, 708; C. Micholiziana, 708; Coleus, seedling varieties of, 708; Coreopsis grandiflora, 470; Costus Lucanusianus, 470; Cotoneaster reflexa, 161; Cyrtopodium acule, 650; C. callosum, 46; C. calurum var. Rougieri, 310; C. exul, var. Imshoottianum, 73; C. Lathamianum, 374; C. pubescens, 650; Cytisus Scoparius var. have received instructions to sell the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 8, at half-past 12 o'clock, the above magnificent importations, probably the very finest ever seen in these Rooms. Messrs. PROTHEROE AND MORRIS have personally inspected the Plants, and they are, without exception, the grandest lot ever seen.

Postponement of Sale.

MR. J. C. STEVENS begs to announce that his SPECIAL SALE OF ORCHIDS IN FLOWER and BUD, previously advertised to take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, will be POSTPONED till THURSDAY, JULY 14. Gentlemen wishing to include Plants will please SEND LISTS AS SOON AS POSSIBLE.

Sea View Nursery, near Havant, Hampshire.

TO BE SOLD BY AUCTION by

MESSRS. WYATT AND SON, on THURS-

DAY, July 7, 1892, at the "Bear Hotel," Havant, at 3 o'clock precisely, in one or in six lots, the very valuable FREEHOLD NURSERY, with COMFORTABLE RESIDENCE, known as the Sea View Nursery, in the occupation of Messrs. Ewing & Co., situate at Havant, within half a mile of the Havant Railway Station, the Junction of the London & South Western and the London, Brighton and South Coast Railway Companies. The Nursery consists of 3½ Acres of excellent Land, with good Building Frontages to Wade Court Road and Lymour Road. The ground is well suited for the growth of Roses, for which it has achieved a good reputation; and of fruit and ornamental trees, and other Nursery Stock. Erected on the grounds are several glasshouses and pits, and the whole is well sheltered by hedges, and in an excellent position. The Residence is modern, and substantially built, and contains 3 sitting-rooms, 6 bedrooms, domestic offices, dairy, and outbuildings, with a good flower and fruit garden attached. Possession can be given at an early date, and the purchaser can have the option of taking the stock by valuation. If not sold in one lot, the property will be offered in six lots, consisting of the Residence and Garden, the Nursery Ground of about 2½ acres, and four Building Plots, of 70 feet frontage each, to Wade Court Road.

The Property may be Viewed on application at the Nursery, or to the Auctioneers; and particulars, with conditions of Sale and Plans, obtained of Messrs. WALKER AND WHITFIELD, Solicitors, 22, Surrey Street, Strand, London; and of Messrs. WYATT AND SON, Estate Agents, Valuers and Auctioneers, East Street, Chichester; and Auction Mart, Havant.

THOMAS B. JAMES will hold a SALE of ORCHIDS IN FLOWER at his Sale Rooms, 12, Bull Ring, Birmingham, on THURSDAY NEXT, July 7, at half-past 12 o'clock. Gentlemen intending BRINGING PLANTS on MORNING, will kindly SEND LIST BEFOREHAND.

To the Trade and Others.—Dissolution of Partnership. Extensive SALE of NURSERY STOCK, at New Goldenacre Nurseries, Edinburgh, on JULY 13, 1892, at 11 o'clock Forenoon.

MR. DAVID MITCHELL, HORTICULTURAL AUCTIONEER, has been instructed by Mr. D. W. Thomson (owing to Dissolution of Partnership, and Alterations of New Goldenacre Nurseries) to DISPOSE of, by PUBLIC AUCTION, on the above date, the WHOLE of the MAGNIFICENT STOCK of PLANTS, consisting of Thousands of Palms of all sorts and sizes, comprising choice Kentias, Latanias, Scaforthias, Cocos, and Geonoms; beautifully coloured Draecenas, and Crotons in variety, Anthuriums, Pandanus, fine lot of Eucharis and Azaleas (including large number of Deutsche Perle), Gardenias, Ferns, orchids, Pitcher Plants, Stove and Green-house Climbers, Liliums, and Miscellaneous Plants in quantity.

Catalogues, in preparation, may be had from Mr. D. W. Thomson, New Goldenacre Nurseries, Edinburgh; or of the Auctioneer, 6, Comely Bank.

Cable Cars from Hanover Street to Goldenacre Toll every few minutes. Plants now on view.—Edinburgh, June 25.

Arlesley, Bedfordshire.

On the main line of the Great Northern Railway, midway between Bedford and Baldock and close to the ARLESLEY Station, THE "WATERLOO" FARM, a Freehold and Tithe-free Estate of valuable Garden Land, containing 330a. or. 0p., and having an extensive frontage to the road from Arlesley Station to Stotford, let to Mr. Daniel at an annual rental of £575, to be SOLD by AUCTION, at the "Sun Hotel," Hitchin, on TUESDAY, July 26, 1892, at 4.30 o'clock precisely, by

MR. J. R. EVE and Mr. GEORGE JACKSON, (who are jointly concerned).

The "WATERLOO" FARMHOUSE and HOMESTEAD and 250a. or. 0p. of GRASS and ARABLE LAND will be offered in One Lot, and the remainder in Eight Lots, to suit the convenience of purchasers.

Also, the "OLD OAK" PUBLICHOUSE, Garden and Paddock, within 200 yards of the Arlesley Station, and a Plot of BUILDING LAND adjoining, both now let to Mr. Page, of Ashwell Brewery, at the rental of £30 per annum.

The tenancies of the whole of the Estate will terminate at Michaelmas next.

Particulars and Plans can be obtained of Messrs. PRESS AND INSKIP, Solicitors, Bristol; of Mr. J. R. EVE, Bedford, Hitchin, and Luton; and of Mr. GEORGE JACKSON, Hitchin, Baldock, and Royston, Herts.

To Fruit and Plant Growers.

PARTNERSHIP REQUIRED in a GOOD BUSINESS. **MESSRS. PROTHEROE AND MORRIS** have a Client desirous of investing about £2000 in a good FRUIT and PLANT GROWING BUSINESS, and will be glad to hear from any Grower who may be disposed to open negotiations.

NEW ROSES.

WM. PAUL & SON

Respectfully Solicit Orders for the following First-class NEW ROSES, their introductions of 1892 & 1891, Plants of which are Now Ready:—

SPENSER (H.P.), Three First-class Certificates; Award of Merit Royal Horticultural Society; fine Satin-Pink, magnificent and effective. 10s. 6d. each.

LADY HENRY GROSVENOR (H.P.), Award of Merit Royal Horticultural Society; Flesh-colour; exceedingly free. 7s. 6d. each.

ZENOBIA (Hybrid Moss), Soft Rose, large and handsome; a fine addition to the Moss Roses. 5s. each.

CLIMBING QUEEN OF QUEENS (H.P.), a Climbing Sport of the elegant Pink-Rose Queen of Queens. 3s. 6d. each.

SALAMANDER (H.P.), Gold Medal National Rose Society; Bright Scarlet Crimson; very brilliant and attractive. 3s. 6d. each.

MEDEA (Tea-Scented), First-class Certificate; Lemon-Yellow, with Canary-Yellow centre. 3s. 6d. each.

WABAN (Tea-Scented), Award of Merit, Royal Horticultural Society; a Carmine Sport from CATHERINE MERMET; excellent. 3s. 6d. each.

The New CONTINENTAL ROSES of 1892. 3s. each, 30s. per dozen.

The New CONTINENTAL ROSES of 1891. 2s. each, 21s. per dozen.

For full descriptions of the above, and particulars of other New Roses, see **DESCRIPTIVE CATALOGUE**, which will be forwarded Post-free on Application.

N.B.—All other New Roses can be supplied at advertised prices.

A Large General Collection of ROSES IN POTS, for Planting-out, Climbing, and Pot Culture, 9s. to 18s. per doz.; Extra Strong, 24s. to 42s. per dozen.

PAUL'S NURSERIES,
WALTHAM CROSS, HERTS.

24, FREDERICK STREET,

EDINBURGH, June 21, 1892.

As the Partnership carried on by Mr. J. S. IRELAND and myself, as IRELAND and THOMSON, at 81, PRINCES STREET, has been DISSOLVED, I beg to intimate that from this date I will carry on the business of NURSEYMAN and SEEDSMAN under the title of—

DAVID W. THOMSON.

I have acquired the above Premises, also the Nursery Grounds of WINDLESTRAWLEE and GOLDEN ACRE, with the extensive Ranges of Glass and other Offices, that will enable me to carry on a large GENERAL NURSERY and SEED TRADE in all its branches.

While thanking my Patrons very much for their esteemed and kind patronage and support for the last sixteen years, I beg respectfully to solicit a continuance thereof, assuring them that I will make it my earnest endeavour to execute all orders with promptitude, and to supply the best possible articles at Moderate Prices.

Yours faithfully,

DAVID W. THOMSON.

Please Address all Communications to—

DAVID W. THOMSON, 24, FREDERICK STREET, EDINBURGH.

THE
Gardeners' Chronicle.

SATURDAY, JULY 2, 1892.

USE OF SPHAGNUM IN THE CULTIVATION OF ALPINES.

I HAVE already mentioned in the *Gardeners' Chronicle* my experiments with sphagnum for growing alpine, and promised to tell your readers the results of them. First of all, then, I will state that in many cases this plan of cultivation is the *ne plus ultra*. For alpine, the situation of our garden is unfavourable, and is on a terrace raised about 12 feet, the soil of which is light earth brought here and exhausted by long cultivation. At 1½ foot below the surface is gravel, and consequently drought is usual. What we here lack is what English growers sometimes have in too great abundance—humidity of the air, which is one of the reasons of the success and development of the alpine flora on our plains. Hence it is that all the growing plants introduced from England die, while the same species succeed well with us if we raise them from seed. The reverse of this also applies—that is to say, that our plants, however stunted and small, succeed admirably in the fostering climate of green England; therefore my trials were made in a dry climate, and under a burning sun. I have already said that *Arnica montana*, which never before flowered in Geneva, *Parnassia mysorensis*, *Saxifraga aizoides* and *stellaris*, and other plants, have flowered abundantly when grown in pure sphagnum. I have also told how *Edelweiss*, a silicifugal and limestone plant, bloomed well in sandy sphagnum, though it is true that we watered it with chalky water. The results obtained this spring are still more conclusive and surprising. A plant of *Soldanella montana* which I set in sphagnum in April, 1891, on a wall exposed to the full sun, did capitally, and has borne more than fifty flowers. The plant was shown at the Lyons Exposition last April, and much admired. I repeat of this plant what I have said of *Arnica*—that a *Soldanella* has never flowered in the alpine garden, and that it but rarely succeeds at Geneva. Many plant-lovers use artificial means to keep up around the flower-stem and buds the moisture necessary to ensure success. In my book on the subject I have recommended various means of managing this. Now my *Soldanella* not only bore more than fifty flowers, but they were successive on the little plant for more than six weeks; therefore, the culture of this plant is made not merely possible, but easy, in our hot, dry climate. Yet, in England, I would not counsel its growth in pure sphagnum, but in a mixture of sphagnum and peat, for with this I have succeeded with most tender plants. I have now last year's plant of *Edelweiss* growing in pure sphagnum, and it is doing well, and bearing twelve fine flowers—not a great number for *Edelweiss*, but they are well-formed, pure white, and unusually large. Furthermore, they

are of similar habit to the mountain Edelweiss—dwarf, shrubby, and in full vigour. *Saxifraga aizoides* forms a dense tuft nearly a foot across, and covered with quite normal blossoms.

Thus it is with most of the old plants put into sphagnum last spring. All who see them admire them much. Seeing these results, I continued my experiments, and planted in sphagnum, either pure, or mixed with peat, all the delicate species of the higher and lower elevations, and the results hitherto obtained are all similar. I have more than eighty plants of *Pinguicula alpina*, *grandiflora*, *Reuteri*, *leptoceras* and *vulgaris*, in flower. *P. Reuteri*, is still covered with large pink flowers. *Aristophylos alpina*, which I have never seen cultivated, nor succeeded with, in Geneva, does excellently in sphagnum. So do *Saxifraga aquatica*, *S. rivularis*, *bronchialis*, *Hirculus*; *Dianthus callizonus*, *neglectus*, and *alpinus*; *Parnassia palustris*, *Gentiana purpurea* (with which I have succeeded for the first time), *alpina*, *Clusii*, *angustifolia*, *Kochiana*, *brachyphylla*; *Heuchera sanguinea*, *Silene acaulis*, *Arctostaphylos Uva-ursi*, *Azalea procumbens*, *Rhododendron Chamæcistus*, *Ephedra helvetica*, *Campanula cenisia*, *Achillea atrata*, *moschata*, *nana*; *Gentiana bavarica*, on which I have had more than twenty blooms in one pot, which were of the same intense blue as on the mountains; *Aquilegia alpina*, and *Papaver pyrenaicum*. All these plants grow wonderfully, are in full sun, in sphagnum, alone, or mixed with peat, all are watered freely every evening, water being a *sine quâ non* to their existence under these conditions. The influence of sphagnum on seedlings is also great. I have several times made experiments with it, and the results have surprised me. In 1884 I had already made a few trials and recommended the plan, but had not insisted particularly upon it, because I had not then tried it with as many very tender species as I have since done. The alpine garden now receives seed from all the mountainous countries of the world, and it is, therefore, important that they be carefully sown. Now, the results obtained from sowing in a mixture containing a third part of sphagnum are astonishing. I can but strongly recommend the plan to all growers of alpine plants. As for the influence of sphagnum on the plant itself, I have nothing definite to say further. The habit is preserved, the plant remains dwarf and compact, the stem short, the flower large, and of the bright hue peculiar to the alpine flora. I have noted that the blooming of plants grown in sphagnum is somewhat later than that of other plants. Thus, when *Dianthus alpinus* was everywhere over, and my plants grown in ordinary soil were seeding, the clump grown in sphagnum began to bloom. This was the case also with *Campanula cenisia* and *Raioteri*, *Saxifraga aizoides*, and several other plants. I again recommend English growers of alpine plants to try this method. It is possible that the results in a climate so moist and favourable to the development of vegetation would be negative. Still this remains to be proved. Who knows but that a lack of nourishment might check the over-exuberant growth of the foliage and stems to the advantage of the flower. In central France, where I have recommended this method of cultivation, M. Isaac Demole, a well-known amateur, who possesses a Villa at Cannes, has recently made trials of cultivation in sphagnum. This is what he writes on the subject:—"The seeds in general germinated well. The plants which you sent me flowered in the following order. (We must not forget that he speaks of the climate of Cannes where *Rosea* bloom all the winter.) January 1, *Linaria alpina*; February 1, *Heuchera sanguinea*; March 1, *Saxifraga oppositifolia*; early in April, *Linaria pallida*; April 15, *Primula rosea*; 16, *Geum coccineum*; 17, *Dianthus alpinus*; 19, *Erius alpinus*; 25, *Helianthemum roseum*; 27, *Saxifraga Cotyledon*. These alpine plants were placed against a wall full south, the soil in the pots consisting of a third each of sphagnum, loam, and peat, and the pot was half filled with sphagnum for drainage. But," adds M. Demole, "my gardener, M. E. Gottreux,

squares no pains. He is a Swiss, who has guarded his plants as though they were his federal colours." *H. Correvon, Directeur du Jardin Alpin, Genève.*

NEW OR NOTEWORTHY PLANTS.

CYMBIDIUM HUMBLIOTII, *Rolle, n. sp.** AND
C. FLABELLATUM, *Lindl.*

It is strange how long a period sometimes elapses before an imperfectly-described plant becomes fully known. As long ago as 1822, Thouars published a rude figure of a Madagascar Orchid, under the name of *Limodorum flabellatum*. A few years later Lindley transferred it to *Cymbidium*, without, however, seeing a specimen. Mr. Ridley, in his paper on "The Orchids of Madagascar," remarks, that he has grave doubts if the plant belongs to *Cymbidium*, as now understood. In looking through some dried specimens collected by M. Leon Humblot in Madagascar, I came across not only the long-lost plant, but also a much finer species, apparently undescribed, and feel no hesitation in saying that both belong to *Cymbidium*. And now the novelty has appeared in cultivation. A fine plant was exhibited at a meeting of the Royal Horticultural Society on June 7 last, by C. Ingram, Esq., of Godalming, as *Cymbidium Loise-Chauvierii*, and was awarded a Botanical Certificate. With regard to the name, a word must be said. It has been applied to a so-called "scarlet *Cymbidium*" (which may be allied to the scarlet *Phalanopsis* and blue *Rose*), and it would be a pity to transfer it to a plain cousin in green and black, in order to avoid the trouble of having to coin a name in harmony with the principles of binomial nomenclature. M. Humblot is equally entitled to the honour, and I should not be surprised to find that the living plant, like the dried one, has been through his hands. *C. Humblotii* is a bold and striking plant, with rhizomatous stems, leaves somewhat resembling those of *C. giganteum*, and a branching panicle of numerous green and black flowers, which strongly recall those of *Cœlogyne pandurata*. Its characters are pointed out in the accompanying diagnosis. The presence of the genus in Madagascar is very interesting, but not surprising, when it is remembered what a considerable number of Malayan genera are represented in that island, and yet absent from continental Africa. *Cymbidium* is distributed from South China and the Eastern Himalayas to Ceylon and the Malayan and Philippine Archipelagos, with three outlying species in tropical Australia, and two in Madagascar. The second Madagascar species may yet appear in cultivation. *R. A. Rolle.*

HOME-GROWN ORANGES FOR DESSERT.

OUR trees are now laden with their fruits, and have a very attractive appearance; this suggested to me the desirability of offering a few remarks upon their culture, and their value in the garden. Oranges are now imported of a quality superior to what they

* *Cymbidium Humblotii*, n. sp.—Stems rhizomatous, stout, about 6 inches long, clothed with persistent sheaths. Leaves linear, acute, $1\frac{1}{2}$ to $1\frac{3}{4}$ foot long, 5 to 9 lin. broad, leathery, and strongly nerved. Panicle branched, erect, 3 feet high, many-flowered. Bracts linear-lanceolate, acuminate, $\frac{3}{4}$ to 1 inch long. Pedicels $1\frac{1}{2}$ to $1\frac{3}{4}$ inch long. Flowers smaller than, but closely resembling, those of *Cœlogyne pandurata* in colour. Sepals linear-oblong, acute, $1\frac{1}{2}$ in. long, 5 lin. broad, light green, the lateral ones strongly falcate, and carinate near the apex. Petals concave, lanceolate-elliptical, acute, $1\frac{1}{2}$ inch long by $7\frac{1}{2}$ lin. broad, light green, with a few small spots on the lower half. Lip 1 inch long, three-lobed; side lobes very broadly rounded; front lobe elliptical, oblong, obtuse, undulate, yellowish-green, with brownish-black margin, and many similar spots on the disc and side lobes, with an elongated blotch on either side of the lip; disc with a pair of short parallel plates with recurved margins near the base, and three slender crenulate keels in front. Column 5 lin. long, broadly clavate, pale green, with many black dots on face, a narrow black margin, and deep brown anther-case.

† *Cymbidium flabellatum*, Lindl., *Gen. et Sp. Orch.*, p. 187; Ridley, in *Journ. Linn. Soc.*, xxi., p. 472; *Limodorum flabellatum*, Thouars, *Arch. Hes Afr.*, t. 35, 40.

used to be, but they are still much inferior to such as we can grow in our hothouses in England. I have frequently had examples of the Malta Blood and the St. Michael's Oranges so full of juice, that the skins have been rent by the internal pressure. We have grown specimens of the St. Michael's Orange 8½ inches in circumference, and the heaviest fruit weighed just 9 ounces, and these were gathered from a tree in a 13-inch pot, which produced four dozen of well-ripened examples. Their culture is very simple, but they require what gardeners term "good growing." For instance, the black peaty soil in which Orange trees are sometimes planted would not produce such fruit; there is no holding power in it—nothing to throw vigour into the trees. Good fibrous yellow loam, the top spit from an upland pasture, is by far the best material for them; add to four parts of this, one of decayed stable manure, and to each barrow-load a heaped-up 8-inch potful of half-inch bones. I also add the same quantity of broken charcoal, which maintains the compost in an open porous state. The drainage should be good, and formed of clean broken potsherds placed carefully, and over them some clean loam fibre, to keep the potting compound from mixing with the drainage. I re-pot the trees about once in two years, and a good time to do it is when the fruit has been gathered, in the spring. Before re-potting any of the trees, remove as much as may be convenient of the old spent soil with a pointed stick. Over-potting must be avoided, as this does not improve the vigour of the tree even. For instance, if a tree was well established in a 9-inch pot, I would replant it in one 11 inches in diameter, and it ought not to be planted appreciably deeper; but the new potting material should be rammed in rather firmly.

When the trees are re-potted, they should be placed in a house where they will have a moist atmosphere and rather warm temperature. I do not give any water at the roots for two or three days after re-potting them. The leaves may be syringed with tepid water, but care must be taken that too much water is not supplied to the roots until they have run freely into the new potting material. Our own trees will now be re-potted, and the above remarks may be useful to those who have trees which require the same process. We may now expect the blossoms to open, and this will happen before the fruits are gathered sometimes; the atmosphere should be kept rather drier at this time to promote a free set, and air should be admitted rather more freely. A close moist atmosphere when the trees are flowering might cause the blossoms to drop before fertilization had taken place.

Orange trees, when grown in a high temperature, are very liable to be attacked by pests, which cause the trees to become unhealthy. The mealy-bug attacks them sometimes, and this troublesome pest always does much damage to any tree or plant it thrives upon. Scale is even more frequently present both on the young and old wood, and it makes a sad mess of the leaves by encrusting them with a sticky substance. The best way to clean the trees is to wash the leaves and wood with a sponge and warm soft-soapy water. Of course, if a house can be entirely set apart to the culture of Oranges, it is very easy to grow the trees well, but failing this they will succeed in any house where a good temperature is kept up, and the trees are placed in a light position. They ought not to be shaded at any time, but as evaporation must be excessive in hot dry summer weather, the trees should be syringed twice daily, and freely supplied with water at the roots. I believe the best Oranges to grow for dessert purposes in English gardens are the Tangerine, St. Michael's, the Malta Blood, the White Orange (which has not a white but a yellow skin), and a new one to me, which Mr. Rivers sent here last year, named *Dulcissima*.

Pine-apples and Oranges could be grown well together in the same house if the Pine beds were placed in the middle, and the Orange trees arranged on stages at the back or front of the house. If the fruit is set in February or March, it will take a very long period to ripen. The Tangerine is the

earliest to ripen, and the fruit of that variety would be ready to gather about the end of September, the others a month or six weeks later; but it hangs well upon the trees, and retains its flavour for two months after it is ripe. Although good Oranges may be purchased at a much cheaper rate than they can be grown, still it is not well that the money value of things only should be thought of; sentiment ought to have a place, and the trees laden with their delicate sweetly-perfumed blossoms is to many people worth all the expense and trouble bestowed upon them, but when we add to this the handsome well-flavoured fruit, enough has been said to recommend Orange trees for extensive culture. *J. Douglas.*

PERMOYRE, BRECON.

HAVING a few hours to spare on the occasion of a recent visit to Brecon, I went up to Permoyre, the residence of R. D. Cleasby, Esq., J.P., and was shown over the extensive gardens and grounds by the head gardener. In the viceries, the Vines in the early-house were ripening off their foliage, the fine bunches being quite ripe, and the large berries of splendid colour. The Muscat of Alexandria, too, carried numerous grand bunches. The late-house was promising a still heavier crop, and many of the bunches will, when ripe, turn the scale at 7 lb. Peaches, numbers which I was informed had been gathered this season, and were fine and large, some weighing more than 8 oz. In the plant-houses, too, the same skill that is exhibited in the forcing of fruits by Mr. Mathews is seen in the crowded stages of clean healthy, well-grown plants, which are chiefly for the decoration of the table and apartments. Most of the large plants had been done away with to make space for a larger number of these smaller plants. It is difficult to single out any species of plant that is better grown than another, as all were good healthy plants, but perhaps Crotons, Dracenas, Caladiums, and among the latter a splendid lot of *C. argyritis*; *Gloxinias*, *Palms*, *Begonias*, and *Carnations*, exhibited the greater degree of superiority. In the Rose-house, a building measuring 39 feet by 18 feet, the centre is occupied by a plant of Fortune's Yellow, which covers about one-half of the house, and from which nearly 3000 blooms have been cut this season. In the Palm-house a very fine plant of *Bougainvillea glabra* is covered with bloom, forming a pretty sight. A good collection of herbaceous plants is to be found in the borders and beds set apart for them. The kitchen garden shows skilful management, the walls being covered with healthy and well-grown fruit trees of various kinds; the quarters well-cropped with vegetables, and everything in the best of order. *J. W.*

DWARF BRITISH FERNS.

THERE is certainly no class of plants better fitted for household pets than the many dwarf forms of British Ferns, which have been produced by sporting from the normally large species, and to these may of course be added several species which are naturally of diminutive stature. The former class is, however, the more interesting and better adapted for home collections, since to it belong, as a rule, species which are of the easiest possible culture, whilst the naturally small species, being mostly rock or wall Ferns, demand generally special treatment, and are much more apt to perish by confinement or over-watering.

Few people—in fact, none outside the coterie of British Fern specialists—know that a small table or stage facing a north window could accommodate a score or two of the dwarf, congested, crimped, and curly varieties of Ferns which we have in view, a space, in fact, in which a single full-grown normal specimen would be "cribbed, cabined, and confined."

As a special example of this sort, we may instance the ordinary crested male Fern (*Lastrea f. mas. cristata*), which, if grown properly, will form a huge shuttlecock of beautifully tasseled fronds, fully 4 feet in height from the top of the trunk, which it forms

in June, and which may be itself a couple of feet high; the spread of the crown will be also 4 or 5 feet in diameter. At the other end of the scale, in precisely the same species, we have the tiny *L. f. m. ramulosissima*, more like a very small Parsley plant than anything else; the little fronds 4 or 5 inches long at the utmost, being divided and divided *ad infinitum*. In this same species we have *L. f. m. crispa*, 5 or 6 inches high, *L. f. m. crispa cristata*, a tasseled form of it; *L. f. m. crispa cristata angustata*, a very narrow form of the last. Then we have *L. f. m. crispa gracilis*, with slender leathery divisions, curved hook-like at the tips. These would all find ample room in 4-inch pots, and being evergreen, and, like all the rest, perfectly hardy, are as much winter ornaments as summer ones. A size larger, but still dwarf, is *L. f. m. fluctuosa*, or *crispatisima*, dense, and beautifully crimped, 9 inches high. Among the Shield Ferns, *P. angulare Lyellii* is the dwarfest and prettiest, all the beautiful cutting and detail of the *Polystichum* being crammed into a tiny plant of 4 or 5 inches high. *P. a. congestum* is larger, but very dense, and a crested form of this exists of the same dimensions—about 9 inches. *P. a. parvissimum* is very neat and pretty, but belies its name by reaching a foot in height.

The Lady Fern (*Athyrium filix-femina*), has yielded several gems on like lines. *A. f. f. Edwardsii* is the counterpart of *P. a. Lyellii* in delicate condensation, and *A. f. f. stipatum*, *Grantæ apes*, *P. a. congestum*, but is denser. Then we have *A. f. f. crispum*, an old friend, with a creeping root, which forms dense little clumps of cresting 6 inches high; and *A. f. f. acrocladon*, which, though it is much larger, is so compact as to require little room. The forms *acrocladon*, *densum*, and *veluticum*, are veritable balls of moss-like foliage, more like green sponges than Ferns.

The *Blechnum* Spicant section of varieties is mainly small-growing. *B. S. crispissimum* (Horsley), *B. S. concinnum* (Drury), *B. S. lineare* (Barnes), and *B. S. Maundersii*, are all small by nature.

The Hart's-tongue (*Scolopendrium vulgare*) has yielded a number of forms fitted for culture in limited space. *S. v. spirale*, *muricatum*, *glomeratum*, *Kelwayii*, with its half-dozen synonyms, *Baxterii*, *Coolingii*, &c., and a host of new forms obtained by Mr. E. J. Lowe by crossing from a little crowd of Tom Thumbs in this species, which, from its known habit of adaptation to wall-growing, as well as free growth in the soil, is obviously fitted also for small specimens in pots. Among the small species all the *Asplenias* may be reckoned, and if their natural habitats be imitated by planting them in rocky chinks contrived with bits of porous stone and sandy leaf-mould, they will do as well in pots as out of them. The lightest position suits them best. *Asplenium marinum* benefits by brackish water. *Asplenium viride* is the better for a glass over it, as it wants a damp atmosphere. The several varieties of Maidenhair, *Adiantum Capillus-veneris* take up scanty room as a rule.

The Bladder Ferns (*Cystopteris*) are all dwarf, but are scarcely to be recommended for the purpose, nearly all having a nasty knack of turning brown as soon as the fronds mature under culture. The common Polypody (*Polypodium vulgare*) has yielded only one dwarf form, *P. v. parvissimum*, which is very chary of growth. The whole of the varieties are, however, of medium size under ordinary culture, and, being evergreen, are well worth growing.

We have now indicated a very fair collection, and cannot too strongly recommend the culture of these pretty plants to our lady friends who may have windows facing north, where flowers can scarcely thrive, owing to lack of sunshine. In such a spot all the Ferns named would thrive apace, and amply repay the little care required in watering, which is their chief desideratum. The pots must be well drained, and should not stand in water. A very good plan is to invert a small sancer in a larger one, and stand the pot upon it; a little water standing in the lower one will then do no harm, and sourness will not be induced. When once the plants are installed,

they should be marked in some way, so that they be not turned this way and that as growth progresses. They will grow towards the light, and not towards the room, and any attempt to thwart this natural law by turning them round and round simply results in twisted growth and ugly plants. The table should be on castors, and then, when it is desired to display the plants to one's friends, it can be rolled away from the window and inspected from the front. Light is health to Ferns, as to other plants, hence, give them as much diffused light as possible. Burning sunshine, however, is dangerous. Air, too, is good, but draughts are bad, since the fronds get all the beauty and delicacy rubbed out of them. A general open compost of leaf-mould, turfy loam, and silver-sand, in the proportions of 2, 2, and 1, will suit all we have named; but for ladies it is best to get a peck or so of compost from a nursery. *Chas. T. Drury, F.L.S., F.R.H.S.*

NURSERY NOTES.

ORCHIDS AT ST. ALBANS.

A CHANGE has come over the aspect of the noted Orchid nursery of Messrs. F. Sander & Co. at St. Albans, the well-known long houses running into the corridor in which the Mexican and Guatemala Orchids are grown, and the offices in which the *Reichenbachia* is printed, are now bounded at the other end by an immense intermediate-house, running parallel to the show-house for Orchids in flower, and from which branch off the houses for seedling Orchids and new plants. From these again, the rockeries planted with Ferns and Orchids, lead to the offices.

Taking the first group, consisting of new Orchids in flower, we note that most novel *Cattleya Amesiae*, a beautiful species with pure white sepals and petals, the flowers being nearly 9 inches across. It was imported from a district lying between that in which *C. Percivaliana* and *C. Mendeli* are found. Next comes the true *C. Victoria Reginae*, which in all respects is an improvement on any known variety of *Laelia elegans Turneri*; then we have the new *Cattleya princeps*, with magnificent flowers, the greenish sepals and petals almost entirely covered with a port-wine colour. Beside these, we find the original *Cattleya hybrida*, which was supposed to have been lost to the country; a new and overpoweringly fragrant white *Angraecum* from beyond the Nyassa territory; the beautiful *Calanthe vestita Fournierii*; the distinct and beautiful *Cypripedium Chamberlainianum*; the pure white *Odontoglossum Pescatorei Schroderæ*; the pretty *O. Schroderianum*; the dwarf but exceedingly showy *Oncidium Gravesianum*; the brilliant scarlet and yellow *Renanthera Storyii*; the lovely ivory-white *Phalenopsis Micholitzii*; the beautiful *Miltonia Bleuiana splendissima*; and that most richly-coloured of all hybrid Orchids, *Laelio-Cattleya Arnoldiana*. In the *Cattleya*-houses, with their pretty rockeries at each end, over which are suspended hundreds of the white forms of *Laelia anceps*, we found a fine display of the varieties of *Cattleya Mossiae* and *C. Mendeli*, with an occasional plant of the white forms of each, viz., *C. Mossiae Wagneri* and *C. Mendeli Bluntii*. *Laelia purpurata*, too, is much in evidence in these houses; varieties which are here thought ordinary putting the named varieties of olden times much into the shade.

In regard to the *Lælias*, *Cattleyas*, and other Brazilian Orchids, in the culture of which Mr. Godseff is a high authority, one feature should not fail to be noted, as it is of importance to cultivators generally, and that is the profusion of root growth which the plants, one and all, exhibit, and which, doubtless, sufficiently accounts for the goodness of the flowers. Mr. Godseff imputes this good state of things to his strict enforcement of the rule with regard to the most careful watering of the plants at all seasons, letting there be no lack of moisture while the plants are growing, and especial attention to their being kept tolerably dry for a certain period

after the growths are matured. The plants which are thus managed root more freely than those that are over-watered.

In the large tank-house, with its rich display of coloured Water Lilies, are hundreds of the fine *Dendrobium Phalenopsis Schroderianum* of every shade; suspended over them, are the fine yellow *Oncidium ampliatum majus*; also the new *O. Gravesianum*; a new strain of *O. Lanceanum*, which have generally white labellums like the figured *O. L. Louvrexianum*; the handsome *Spathoglottis Ericssonii*; the true yellow *Phajus bicolor*; and the exceedingly rare orange-coloured *Calanthe curculigoides*.

The house containing many hundreds of *Miltonia vexillaria* in flower, necessarily has some distinct things among them, especially when it is considered that this importation produced the unique *M. v. Leopoldii*, *M. v. Sanderiana*, *M. Mrs. H. Ballantine*, and others. One of them at present in bloom has snow-white flowers, with just a ray of rose colour on the petals, and the usual reddish lines on the lip. Another is rose coloured, the markings on the lip being very nearly scarlet. In this house are plants of the new *Epidendrum Godseffianum*, with its broadly-expanded white labellum, veined with rose, and well worthy to bear the name of the able manager of this fine establishment. In the next house we found several of the new hybrid *Thunia Brymeriana*, an exquisite flower, pure white, the labellum only bearing a delicate tracery of purple, and a slight tinge of yellow; also *Odontoglossum læve*, *O. hastilabium*, *Aërides Houletianum*, and various new botanical Orchids imported from a new district in Brazil.

A hurried glance through the remainder of the fine display of Orchids in bloom revealed a choice lot of *Odontoglossums*, of which those planted-out are said to thrive the best; a fine bank of *Odontoglossum citrosimum*; a grand importation of *Cypripedium Chamberlainianum* and *C. niveum*; a quaint and pretty lot of new *Cynoches* and *Catasetums*; *Dendrobium cupreum* with twenty spikes; *Cypripedium superbiens* Demidoff var. with a dozen blooms, *C. exul*, *C. Rothschildianum*, and a number of new hybrid *Cypripediums* of great promise.

Not the least of the attractions of this firm is a fine collection of new stove and greenhouse plants, which its collectors have for the last few years been forming. Among these the most striking at present is *Dipladenia Clarkei*, a variety with dark crimson flowers, with a fire-like glow in the tube; a free-flowerer, and very different in that and other respects from the allied *Dipladenia atropurpurea*. With these also are a new spiny-leaved *Erythrina*, a magnificent form of *Begonia corallioa* (Sander's var), which covers the side of the house; the beautiful silver and green *Dracæna Sanderiana*; the lovely and free-flowering *Balsam* (*Impatiens Sanderiana*), ranging in colour from snow-white, with a crimson eye, to rosy-red; and three houses of New Guinea plants, of which it is better not to say much until they mature, but which when established, will make a name for themselves.

MESSRS. BARR & SON, LONG DITTON.

When visiting these nurseries a week or so ago our attention was particularly attracted by the very bright and striking display of Messrs. Barrs' collection of Chinese double *Pæonies*. Some of the earlier varieties were already past their best, and it was easy to note what special varieties would be most suitable for prolonging to the utmost the *Pæony* season. The first to which our attention was attracted is not a new one, and it is as cheap as any in the collection, but it is a fine flower nevertheless. Its name is *Madame Furtado*; very large rose or carmine-coloured bloom, its centre florets are somewhat paler, almost salmon, and it has a very rose-like scent. *Lord Salisbury* is a tall grower with large dark crimson flowers, which are not quite so double as some others; it is a very free bloomer. *Couronne d'Or* is a charming flower. It is white, with a little laced crimson towards the centre, where the yellow anthers are very noticeable

and pretty; it is large, and one of the latest of this section. *Snowball* is a pure white, and when opening has a faint yellow tinge in the centre; it is perhaps the most desirable of all the many charming varieties of the white group. *Solfaterre* has outer petals of pure white, and the centre is a very pale yellow with the perfume of *Roses*, and possessing a magnificent appearance. *Eugène*

A very different variety is that called *Triomphe de Paris*, which is semi-double only; it is white, with a centre of primrose-yellow, in its early stages, and is rose-scented. The very deep crimson *Louis Van Houtte*, with perhaps a shade of purple, is a very distinct and fragrant flower. Many more deserving attention we were obliged to pass. The above varieties are very flowering and fragrant, and most of them are late.

Among the general nursery stuff the *Irises* were practically over, but some large beds of *I. Kämpferii* were just in bud, and are very strong and healthy. In the Herbaceous department was a bed consisting of hybrid forms of *Lupinus arboreus*, and several of the varieties had a very pretty effect. A good patch of *Myosotis azorica*, all quite true, was a pretty sight indeed; and in another bed was a variety called *M. a. Imperatrice Elizabeth*, which only differed from the type in that it is a little taller.

The large *Senecio macrophyllus*, some 4 feet high, had just expanded its blooms. This rather coarse-looking plant with its broccoli-like leaves, is only suitable for very large borders, but given a suitable position, it has a very fair effect. In a bed of seedling *Gaillardia maxima*, were some very fine varieties, and we were informed that Mr. Barr is going to work up a collection of these pretty and showy flowers.

The striking flowers of *Papaver bracteatum* were to be seen, and also those of a pretty pink variety called "*Pink Beauty*." *P. pilosum*, an orange coloured variety, also very beautiful, is an exceedingly floriferous plant. Among the *Potentillas* was the exceedingly bright scarlet *Wm. Rollinson*, and also a pretty yellow variety called *Vase d'Or*. *Silene maritima*, fl.-pl., is a good dwarf growing plant for the rockery, bearing rather large white flowers. A large number of *Larkspurs* in variety, and some beds of *Violas* were very gay, but the *Violas* are just being subjected to the cutting that necessarily precedes propagation. *Meconopsis nepalensis* (*Himalayan Poppy*) had its yellow blossoms fully expanded, and was doing fairly well in a damp, somewhat shady position. *M. Wallichii*, the blue one, was not so forward, but the stems were much stouter and higher. The beautiful *Onosma stellulata taurica*, which is rarely seen doing well, was covered with its pretty yellow blossoms; and close by was a bed of *Lychnis vespertina alba plena*—the *Carnation-like* blooms of this plant are exceedingly useful. The hardy *Pitcher-plant*, *Sarracenia purpurea*, has lately been planted on the side of a stream which has been dammed, where Mr. Barr intends to plant many bog-loving plants. It is too early to say that it will thrive in its new position, but appearances give every indication favourable to such a result.

TSUGA PATTONIANA.

We are indebted to Mr. Croucher, of the Gardens at Ochertyre, for the opportunity of figuring the male flowers of *Tsuga Pattoniana*. So far as we know, these have not been previously figured, but their beauty, apart from botanical interest, seem to render it desirable to do so. As to the first point, Mr. Croucher writes in warm terms of appreciation, the bush being covered at the time he wrote, with a sheet of lilac catkins. Their general appearance is well shown in Mr. Smith's drawing (fig. 1). Each is from 10 to 12 millimetres long, supported on a slender stalk of about the same or slightly greater length, and which is surrounded at the base by a bud-like mass of overlapping brown perule. The anthers are club-shaped, 2-lobed, splitting lengthwise, of a violet colour, and provided at the back with a very short point. The pollen-grains are large and globular, with a central band, but not winged as in *Pinus*. This latter point raises a doubt as to whether the plant we are now dealing with is the true *Pattoniana* or not, for Engelmann expressly states, *Bot. California*, ii., 121, that the pollen grains are bilobed, and resemble those of true *Pines*. The leaves of Mr. Croucher's specimen, however, agree perfectly with those of a native specimen sent us

FIG. 1.—*TSUGA PATTONIANA*: FOLIAGE AND MALE FLOWERS, LILAC. DETAILS ENLARGED.

Verdier is one of the paler varieties, and may be described as blush-pink, the centre being almost white; when opening it has much the appearance of a *Rose* in the form it assumes. *Henry IV.* is a *Rose-scented* variety; colour, rosy-pink, and very late. *Madame de Vatey* is an especially pretty flower, and when first opening its white centre has a charming effect with the large outer or guard petals, which are flesh-coloured. It possesses a very rich fragrance.

from the foot of the "Three Sisters," Oregon, by Mr. Collier. Moreover, the leaves are stomatose on both sides, whilst in other *Tsuga* the stomata are on the lower surface only. In form, the leaves are as Engelmann describes, acutish; some are, as he says, convex and keeled above, but others on the same twigs are furrowed in the centre.

The tree which has also been confused with *Abies Hookeriana* and *A. Williamsoni* occurs on mountain tops, and is limited, says Lemmon, to the upper points of forests that creep up along glacier-beds and volcanic ravines, close to the perpetual ice in the cascade and Sierra Nevada mountains. In British Columbia it grows at an elevation of 8000 feet; further south it attains 10,000 feet.

"In many of these regions," says Mr. Lemmon, "the lower part of the belt mingles with other trees, such as Red Silver Fir, Mountain Pine, or Aspen Poplar, and here the trees often attain a large size—6 to 12 feet in diameter at base, tapering to a slender shaft, 80 to 150 feet high; but in strictly alpine situations the trees are reduced to low conical masses of foliage, or prostrate creeping shrubs.

"In favourable situations the lower limbs are retained, and become long, out-reaching, and spreading over the mountain slope for many feet; the upper limbs are irregularly disposed, not whorled; they strike downward from the start (so that it is almost impossible to climb one of the trees for the want of foothold!), then curving outward to the outline of the tree; they are terminated by short hairy branchlets that decline gracefully, and are decorated with pendent cones, which are glaucous purple until maturity, then leather brown, with reflexed scales. The main stem sends out strong ascending shoots, the leading one terminating so slenderly as to bend from side to side with its many purple pendants before the wind, and shimmering in the sunlight with rare beauty."

From the other Hemlock Firs, *T. Pattoniana* may readily be distinguished by the scattered or somewhat tufted, erect leaves, as contrasted with the two-ranked (apparently) horizontally spreading leaves of the other species. The form of the leaf we find to be variable, but the presence of the stomata on all sides is a distinguishing feature. On account of the peculiarities just mentioned, as well as others visible in the ripe cone, the plant has been placed in a separate section of *Tsuga*; whilst Lemmon goes further, and raises the plant to generic rank under the name of *Hesperopenke* (Lemmon, *Third Biennial Report of the California State Board of Forestry*, 1890, p. 128, tab. 9).

What is generally grown in gardens as *T. Hookeriana* seems to be only a form of *Mertensiana*, and the same may be said of *T. Williamsoni*.

TSUGA MERTENSIANA has often been alluded to and figured in our columns under this name, and also under that of *T. Albertiana*. It is so universally admired that it needs no description, and we should not have alluded to it at present, but for the opportunity Mr. Croucher has afforded us of figuring the male catkins, which are only 6 to 7 millimetres long. The anthers are lilac, and the pollen-gains, as drawn for us by Mr. W. G. Smith, are just like those of *T. Pattoniana*, but rather smaller in dimensions (see fig. 2). *M. T. M.*

PLANT NOTES.

CLERODENDRON BALFOURIANUM.

I NOTICED a grand plant of this showy and very free-growing and flowering climber in the Azalea-house at Crichel a short time ago. It is trained underneath the apex, there being three massive rows of flowering shoots, extending just upon 40 feet long each. It was very telling in effect. *H. W. W.*

CALOCHORTUS AMENUS.

Among rare bulbs in flower here just now, none are prettier than a *Calochortus* which I imported last year under the above name, and which, if I am not mistaken, is now blooming here for the first time in Europe. It belongs to the *Cyclobothra* section, of

which the *C. alba* and the pretty golden *C. pulchella* are familiar examples. In habit, this novelty is exactly intermediate between these two, but it is very much more free-blooming than either. The colour of the curiously-formed, nodding bells is a very deep rosy-pink, of a particularly pleasing shade. Judging from its vigorous growth, it appears to have a very hardy character, and promises to become a

with three transverse bars of chocolate-red. It was raised by M. Leroy, head gardener to Baron Edmund de Rothschild, Arnicunoillers, Paris. It was the first artificially-raised hybrid *Odontoglossum*, and is of interest as showing the correctness of the supposition that *O. Wilckeanum* is a natural hybrid between the species named, so that *O. Leroyanum* may be considered, according to Mr. Rolfe, as a form of *O. Wilckeanum*. Three years elapsed between the sowing of the seed and the production of the flower-spike. For the first eighteen months the plants resembled *Zygopetalum* rather than *Odontoglossum*. *Reichenbachia*, t. 37.

CYPRIPEDIUM ASHBURTONI VAR. LAUCHEANUM.

A hybrid raised at St. Albans by Mr. Maynard from *C. barbatum* var. *Warneri*, crossed with *C. insigne* var. *americanum*. It is chiefly characterised by the coppery tint of the flower. *Reichenbachia*, t. 38, n. 1.

CYPRIPEDIUM (HYB.) EYERMANNIANUM.

A hybrid from *C. barbatum*, crossed with *C. Spicerianum*; described by Mr. Rolfe in our columns, December 27, 1890, p. 747. *Reichenbachia*, t. 38, f. 2.

CYCNOCHES CHLOROCHEILON.

A good representation of an interesting species, taken from a plant in the collection of the Dowager Lady Howard de Walden. The plate is accompanied by an interesting note by Mr. Rolfe on the highly curious sexual variations of this and allied species. *Reichenbachia*, t. 39.

CATLEYA LODDIGESII O'BRIENIANA.

Flowers pale rosy-lilac, side-lobes of the lip shorter and smaller than in the typical *Loddigesii*, from which Mr. Rolfe distinguishes it as a variety. See *Gardeners' Chronicle*, 1889, part 2, p. 700; 1890, part 2, p. 702.

A TRAVELLER'S NOTES.

(Continued from vol. xi., p. 753.)

SAHARUNPUR, December 16.—At Saharunpur there is little to see but the government gardens. Mr. Gallon, who has been in Saharunpur thirteen years, came there direct from the Edinburgh Botanic Gardens. The garden, some 200 acres in extent, is maintained for the trials of new economic plants and for the distribution of vegetable and other seeds, and the like. Although it receives 20,000 rupees annual subsidy, it is almost able to pay its way, as it returns 16,000 rupees.

It is scarcely kept up for the people's pleasure, Saharunpur not being an important place, and there being but few English at the station. There are no beds in the garden, the entire space being laid out with winding roads, isolated trees and a few clumps, whilst here and there is a small pond. There are two or three fine avenues of *Casuarinas*—chiefly *C. muricata*, some 60 feet high, a good sized house covered with grass and a museum of no especial interest.

There is but little shrubbery—except round the boundaries in places—most of the place being under grass. Sixty acres are set aside for saving seeds and making experiments with new Cottons, Sugar-canes, and such like.

Close by a grass-covered house is a *Bougainvillea glabra*, 35 to 40 feet high, climbing over a tree in wildest profusion—it is the largest mass I have yet seen. Two species of *Calamus*, *C. Royleana* and *C. Roxburghii* are represented; the former is a pretty climber, usually found at the foot of the Himalayas, where it forms a jungle so thick that no elephant or anything else can go through it. Though its canes are not so useful for chairs and other economic purposes as the latter, I yet think it is the prettier of the two.

Beside the avenue of *Casuarinas*—a truly fine sight, as already stated—there is a very neat one between a small glasshouse and the museum, of *Cupressus sempervirens*, each tree being from 25 to 30 feet high. There is a row on each side of a narrow path; it is like passing between tall pillars. An arbour leading to it is quite covered with *Ficus pumila*, producing, Mr. Gallon tells me, very large fruit.

Besides the large *Bougainvillea glabra*, this garden contains the largest mass of *Thunbergia laurifolia* (now out of flower) I have yet seen. This hangs

FIG. 2.—*TSUGA MERTENSIANA*: FOLIAGE AND MALE FLOWERS.

very good garden plant. *C. G. Van Tubergen, Haarlem*. [A pretty border or pot-plant, of a shade of colour extremely rare in garden flowers. Our correspondent calls it "deep rosy-pink," but it would be better described as rosy-purple. Ed.]

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM (HYBRIDUM) LEROYANUM.

A CROSS out of *O. crispum* by the pollen of *O. luteo-purpureum*. The flowers are 3½ inches across, petals broader than the sepals, pale straw-coloured,

like one solid curtain for at least 40 feet from a tall specimen of *Schleichera trijuga*, and it is nearly as broad as it is high, and so thick that literally not a leaf or twig of the tree supporting it can be seen. It forms a most striking picture.

A pretty tree not far from this spot is *Dillenia indica*, with foliage much resembling though twice the size of that of our *Castanea vesca*. Mr. Gallon tells me its flower is like *Magnolia grandiflora*, only bigger. The fruit is used for curries by the Bengalese.

One large Mahogany, *Swietenia Mahogony*, is in the garden, and a tree I have mentioned as being at Baroda, *Kigelia pinnata*, is represented by a good specimen. Many of its last season's flower racemes are 8 to 9 feet long, and one, in particular, has reached the astonishing length of 15 feet. A plate in the museum gave me an idea of what a splendid thing this must be. The flowers are purple, in shape not unlike those of *Rhododendron arboreum*, 4 inches in diameter (according to the plate), and they are fairly closely set on the racemes, which possess the faculty of sending out another raceme half way down; this second one often reaches the ground. A raceme, however, does not often send out another for more than one or two seasons at the most.

The brown seed pods of *Lagerstrœmia regina* attracted my attention. I am told its large purple flowers are very fine during the rains. *Bauhinia variegata*, with pink and white flowers, very common in the jungle, is well represented in the garden. There is also a large Fig-tree here, a fine specimen with numerous aerial roots, which I first took to be a Banyan; but on closer examination, I found its foliage was much smaller. It was a specimen of *Ficus retusa*.

Mr. Gallon considers he has the largest *Araucaria Cunninghamii* in India; it is certainly a splendid specimen, some 70 feet high, regular and even. Not far from it is one of the chief ponds, with a fine variegated *Agave americana* on the bank, and a large mass of *Papyrus antiquorum* in the centre. This is so thick that one can well understand a clump of this species having hidden the infant Moses, but withal, it is most graceful; it is at the foot of a tall *Phoenix sylvestris*. Several *Phoenix* are about the grounds. Mr. Gallon thinks the Arabs must have brought these Palms over, as all seem large trees, and there are no young ones about. A very curious sight is one of these *Phoenix*, some 50 feet high, the lower portion of the stem of which is completely encircled by a *Ficus religiosa*. The *Ficus* is, of course, much younger than the *Phoenix*, and having been planted near it has grown round it. It is most curious to see the black stem of the *Phoenix* rising apparently out of the whitish stem of the *Ficus* at some 10 feet above the ground.

A pretty creeper in flower is a white *Combretum*—*C. decandrum*. It was growing over a mop-headed tree, *Phyllanthus indica*, some 30 feet high. As the creeper is only five years old, it must have grown with great rapidity.

On a knoll, not far from another pond, is a pretty little group of Conifers, chiefly consisting of *Cupressus funebris*, *C. sempervirens*, and *Pinus longifolia*, with its long, pendulous needles; it is a native of the Himalaya. Mr. Gallon has several times tried *Pinus Gerardiana*, but it usually damps off in the rains, doubtless on account of its coming from a higher elevation. The individual specimens in this clump are not large, but the effect is pretty, clothing the sides of a somewhat rising piece of ground as they do, with the pond beyond.

The finest foliage-tree in the garden is the Teak—*Tectona grandis*. It is a noble tree, either singly or in avenues, the individual leaf being of a dark, dull green, and often 1 foot in diameter.

Palms are not numerous, or particularly good, as it is, of course, too far north for them, several degrees of frost being frequent. There is, however, one grand clump of *Livistona Martiana* (*Latania borbonica*). A large *Bauhinia Vahlia*, one of the most destructive plants known in the forests, with a main stem 2 feet in diameter, winds and curls in, around, and over a fine piece of *Ficus cordifolia*. The leaves of the *Bauhinia* are often 1 foot broad, whilst the pale yellow flowers are but small.

Near the end of the garden, and close to the Casuarina avenue, is a plantation of considerable size of the *Loquat* (*Eriobotrya japonica*); some of the trees are large and bushy, and in splendid condition. Here it fruits in spring, whilst on the hills and, I am told, in Japan, it fruits in the autumn. The sale of its fruit pays well. Vegetation is, of course, very different here to what it is at Bombay or Baroda; many trees are absent that flourish further south. *Millingtonia* (so often referred to in my former

letters), though it grows, never flowers, I am told, as it does further south—a few solitary bunches on the top, is all it can produce. It has also the disadvantage of being shallow-rooting, and the storms play great havoc with it. A pretty shrub I had not seen before is *Holmskioldia coccinea*; it flowers most freely, the chief beauty lying in a great red calyx, the corolla being almost imperceptible. Its long sub-pendulous shoots are covered with bloom.

English Pears are not much good here, but Mr. Gallon showed me a nice young plantation of a Chinese variety, which he says is very good for cooking. He has also some forty varieties (not very dissimilar, I fancy) of Chinese Peaches; he says they are good, not cling-stones, and more juicy than ours, which he is not able to do much with. It is a curious thing that *Artocarpus integrifolius* (the Jack-fruit), common in Ceylon, will grow at Saharanpur fairly well, whilst the Bread fruit is an entire failure.

A very pretty grass, which should be hardy with us, is *Eulalia nepalensis*. It is dwarf, but its plumes droop gracefully. Where it is wild on the hills it grows higher than *E. japonica*, and is very plentiful. *Cycas circinalis* and *C. revoluta* grow well. I noticed one large-branched specimen of the former. The method of reproduction followed is to make slits a few inches long in the bark of the main stem, and in about twelve months the young plants appear, which can be detached. *C. circinalis* is found to be freer in this respect than *C. revoluta*.

Roses are very good, quite equal to those in England. They strike freely from cuttings, though they are also budded on a Rose, now found in the jungle in quantity, though evidently introduced at some time or other. Frosts are common at this time of the year, 4° and 5° being usual, whilst in the hot season 90° in the shade, and occasionally 95°, is the ordinary temperature. It is surprising that some things planted in the garden withstand such extremes. *Panax*, *Crotons*, *Dieffenbachias*, *Aralias*, and such like have all to be housed under glass in the cold season—and it is hopeless to plant them out permanently.

Mr. Gallon has three distinct varieties of *Bougainvillea*, *B. glabra*, and two of *speciosa*, one of which he calls *spectabilis*.

Of *B. glabra* one is called the old variety, and has pale pink flowers appearing all the year round—one much brighter, blooming only in the cold weather, and one—the one I have seen so much of, and which seems to grow everywhere, with large dark flowers blooming more or less all the year round—all three have the smooth characteristic foliage of our *B. glabra* in England.

The true *B. speciosa*, with the dark flowers and hairy foliage, generally flowers in March—whilst the one Mr. Gallon calls *B. spectabilis*, flowers from September to May, being at its best in February.

The vegetable gardens, some 60 acres in extent, at one end of the grounds, interested me much. They are chiefly kept for seed purposes, to supply soldiers and others. Nearly all kinds do well, and wonderful tales are told of Veitch's Autumn Giant Cauliflower, it is said to be very fine, and if models speak truly, it must indeed be so; a model in the museum (which Mr. G. assures me is not exaggerated), being nearly 2½ feet in diameter—this refers to the head alone.

Acclimatised seed is usually very good, though rigid selection is necessary. Mr. Gallon finds that Onions, Leeks, and Parsnips seldom germinate from home-grown seed. The difficulty, no doubt, lies, to a certain extent, in its being necessary to sow in October, and consequently it is impossible to get quite fresh seed from Europe. All kinds of annuals do well. Amongst such, the common Dandelion is cultivated as an annual on a somewhat large scale for medicinal purposes, being used chiefly in liver complaint.

A house covered with grass, tied pretty thickly on wire netting, the supports being of iron, is near the museum. The grass used is *Pollinia eriopoda*, and it withstands the heavy rains and scorching sun for about two years. From the roof hang some good specimens of *Acrides* in Bamboo baskets, these being found superior to pots or any other contrivance. Some of the *Acrides odoratum* and *multiflorum*, as well as a few pieces of *Dendrobium moschatum*, were very large, and in fine condition. This house has a low circular dome, from which four paths radiate at right angles. It is not filled with anything of any great interest, chiefly containing *Dieffenbachias*, a few Palms, a *Philodendron* or two, and in the centre, under the dome, a good-sized *Livistona Martiana* (*Latania borbonica*). The prettiest sight in the house is certainly *Oxalis rosea*, grown in pots, numerous flowers, brightly-coloured, appearing above the low dwarf

trifoliate leaves; rows of these line each side of the paths. *Oxalis asinina*, pale sulphur in colour, with leaves bearing a strange resemblance to a pair of asses' ears, is another pretty species.

The museum is chiefly filled with native-made models—some very good—of flowers and vegetables, whilst coloured plates and photographs abound. It is the home of Mr. Duthie, the chief of the botanical service of the Northern Department of India. *James H. Veitch*.

(To be continued.)

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

CAMELLIAS.—The old double white *C. fimbriata alba*, is still one of the best for early flowering, and with sufficient number of this variety and a few of *C. candidissima* for late flowering, *Camellias* may be had in bloom till the end of the month of May. The present is a good time to prepare the different specimens. For instance, those plants which have set their buds the longest time, and are consequently more or less developed, may be removed to a cooler house or placed out-of-doors, the other plants being kept indoors till the buds are well formed, when they also may be placed in a cold house or in the open. No doubt the temperatures the plants are subjected to during late winter and spring has a great deal to do with the time at which they will flower, but by careful observation of the time it takes for the flower-buds to arrive to a certain size, and then to the time that the flowers begin to expand, a glut of flowers at one time and scarcity at another may be in great part avoided. *Camellias* in beds and borders often make strong growths, which set their flowers badly; and to avert this mishap, it is advisable to withhold the water at the roots to a certain extent, that is, partially drying the soil, which will be a means of checking growth, and inducing the buds to set. In these cases, care must be taken that sufficient water is afforded later, to thoroughly moisten the soil when the season of growth is past.

PLUMBAGO ROSEA.—Old plants of the above may have their final shift into 10 or 11-inch pots. Young spring-struck cuttings that are growing in 48's may have their final shift into 32's, affording them a compost of fibrous loam, leaf-mould, and a small portion of decayed manure and sharp sand. The plants should be stopped three or four joints down each shoot, when they will break more regularly than if the points only are pinched out. *Plumbagos* require plenty of light from the time they are struck till they come into bloom.

CHINESE PRIMULAS.—Plants which have been raised from seed early sown in spring will be ready for shifting into small pots. The compost employed may consist of two parts rich loam, one part each of rotted dung and leaf-soil, with clean sharp sand in sufficient quantity to make the soil porous; place the plants in a cold frame, and well up to the glass, keeping them rather close till they are established, and affording them shade during the brightest part of the day.

ZONAL PELARGONIUMS.—Plants which have flowered since the early spring should now be well cut back and placed in a cold frame, keeping them rather dry at the roots till they break, and when the new shoots are about 2 inches in length, the plants should be partially shaken out of the soil, and re-potted in pots of the same size as those they previously occupied. If not already done, put in another lot of cuttings of the double-flowered varieties, placing them singly in small pots in a mixture of sifted loam and sand.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

FRUIT TREE BORDERS should be thoroughly examined, notwithstanding the recent heavy rains, and if dry, water should be afforded abundantly. In the open quarters the rain may have penetrated the soil to a good depth, but borders in front of walls rarely ever get enough by this means during the summer months. Watering fruit-tree borders in rainy weather may seem to some persons waste of labour; but after a spell of dry weather the subsoil is often much drier than is good for the trees, and both manure water and clear water may be safely made use of. If a mulch over the tree roots has been delayed, it may be put on after the watering.

GOOSEBERRIES.—Gather the fruits whilst still green, and when perfectly dry, for bottling, jellies, &c. Bushes whose berries are intended for dessert purposes, should be netted in good time, and properly strawed down, to save the fruits from splashing by rain.

MORELLO CHERRIES.—The young shoots should be laid in a similar manner to those of the Peach, i.e., laying in as many for next year's fruiting as space can be found for without crowding. Morello fruit freely on spurs as well as one-year old shoots, and for that reason all those which must be removed should have four or five buds left at the base, the shoots to be again shortened at a later part of the season. Black aphid is troublesome may be destroyed, and the trees cleaned by syringing them with soap suds, diluted tobacco juice, or water in which Quassia chips have been steeped for some few days, after which clean water should be used several times to thoroughly remove all traces of the insecticide.

RASPBERRIES.—Remove all root suckers that are not required, leaving from five to seven of the strongest for fruiting next year, and encourage new plantations by mulching and watering. The canes of autumn fruiterers must be freely thinned, and mulched with light manure, but on heavy soils it is better not to apply manure over the roots. Summer-fruitering varieties should be heavily mulched on light soils with rich manure.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

CUCUMBERS.—Plants exhausted by long bearing should be cleared out, and replaced with fresh soil and young plants. Cucumber plants grow quickly at this season, and the fruits become usable at a time when there is generally a good demand for them. Attend to stopping the lateral shoots of bearing plants, and liberally top-dress the beds and hills with a rich compost; also make free use of liquid manure.

VINES whose fruit show signs of beginning to colour should have all the desirable stopping of the shoots performed so as to render it afterwards unnecessary so long as the bunches hang on the Vines, for, no matter how carefully this kind of work may be performed, bloom is sure to get rubbed off some of the bunches of Grapes. Red-spider—that worst of evils in Vine culture—should be got well under hand at this stage, and if its appearance be feared, the leaves should be dusted over with flowers-of-sulphur. Admit air freely to thisinery at all such times as the weather is dry; and guard against sudden changes of the temperature. The berries of Madresfield Court and West's St. Peter, are liable to crack, the latter less than the former, and much vigilance must be exercised in maintaining a perfectly dry atmosphere about these varieties whilst the fruit is ripening; for the mishaps of some gardeners with these are due to their growing them in vineries more or less moist, clearly points to the cause, and although it is desirable that the atmosphere of theinery should be dry, yet the border should be abundantly supplied with water, and when the border is wholly or in part inside the house, a bright sunny day should be chosen on which to water it, and then, with all the ventilators standing wide open and a brisk heat maintained in the hot-water pipes for the rest of the day, much of the moisture arising from the border will be carried off before nightfall, and there will be a very small chance of any of the berries bursting. As a precaution, the water-tanks in vineries containing varieties likely to crack, should be drained of the water contained in them, or covered with a close-fitting lid. In damp or rainy weather the external air should be excluded as far as possible, and artificial heat made use of. Manures containing phosphates are aids to growth in the Vine at all seasons, but they are of greatest use when the berries are swelling finally. At this stage, and on wards till the leaves fall, Vine borders should be freely dusted over with some of the several kinds of phosphatic manures before affording water.

THE ORCHID HOUSES.

By H. A. BUBBERRY, Orchid Grower, Highbury, Birmingham.

THE COOL AND INTERMEDIATE ORCHIDS.—In the division in which the above Orchids are grown, a close atmosphere ought to be avoided, the old method of closing early in the afternoon with sun heat being now, generally speaking, discarded where these species of Orchids are well-grown. It should be remembered that these plants mostly grow at a great elevation, where the atmosphere, although

heavily charged with moisture, is breezy and buoyant, conditions which the grower should endeavour to imitate. As to the temperature at which the air in these two structures at the present season may be maintained, the differences need be but trifling, and it is not advisable to try to lay down rules in this respect that would meet all cases, for the temperature will vary according to that prevailing out-of-doors at the season. What we have to aim at is, to keep the cool-house as cool as possible, and should the weather be very hot, the intermediate-house also. I believe cool Orchids are sometimes injured by great heat, and by excessive cold, and that the difference between the winter and summer temperatures in their native country is not so great as some persons suppose. Masdevallias seem to like an even temperature the year round, as do some of the Epidendrams, viz., E. Frederici Guilielmi and E. rhizophorum, which will grow well in the intermediate-house during the winter, and in the cool-house in the summer, and many others could be named that flourish under similar treatment, as Anguloa, Lycaste, and Cymbidium. Generally speaking, the cool-house should, at the present time of the year, register from 55° to 60° by night, and from 60° to 65° by day, and the intermediate-house 60° by night, and 70° by day; of course, in warm weather, both houses are warmer than this, but with shading, ventilation, and damping down, they may be made to feel cool and refreshing on entering them from the outside; the top and bottom ventilators should be open more or less night and day, according to the state of the weather.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

GENERAL OPERATIONS.—With the genial rains that have prevailed over most parts of the country, work in the kitchen garden will be carried out more readily than has been the case in the previous weeks, and the ground will be, in a clean condition, fit to receive the winter crops. Crops of Cabbage and Cauliflowers past their best should be removed to make space for Spinach, Turnips, Kohl Rabi, Celestiac, Horn Carrots, &c. If the land in which the Winter Spinach will be sown is in need of special preparation, or is infested by the grub, or with wire-worm, the present is a good time to set about its preparation. It may receive plenty of soot and wood-ashes in place of the usual animal manures, and if the land is full of wire-worm, a dressing of finely broken gas-lime left on the surface for a few days before digging in will do good. During the interval before sowing the land, frequently fork it over lightly, or harrow it so as to expose it to the birds to search over for grubs, &c.

BROCCOLI may be planted out as fast as land is cleared of other vegetables.

ASPARAGUS.—The cutting from the beds should now cease, and the beds should have a good dressing of fish-manure or common salt and liquid-manure applied. The salt had better be strewn on the beds in rainy weather, and means taken to prevent the young growing shoots from damage by wind.

TURNIPS.—If these roots are required in large quantities, a good breadth should be sown early in the present month, and again towards the end, the later sowings keeping sometimes better than the first one. In growing Turnips for winter use, much depends on the condition of the soil and the nature of the climate. The land should be rich, and deeply-dug for some recent crop—not necessarily for the Turnip crop, and it should be forked over slightly, and the seed sown in drills before the surface gets dry. If sifted wood-ashes, burnt earth, fine leaf-mould, or even potting-bench sittings, be strewn along the drills before closing them, quick germination and rapid growth will follow, soon taking the plants through that stage when the Turnip-fly is so very apt to attack them. For early sowing there is no better variety than Veitch's Red Globe, it being solid in the flesh, and a good keeper. For the later sowing, Golden Ball or Petrowski are excellent, both being of good quality, and keeping longer than any white-fleshed variety.

COLEWORTS.—An abundant sowing should be made at this date, which will be found useful in the autumn and early winter in furnishing Greens, and as the plants can be planted at 1½ feet apart, a great number occupy but a small space. The seed should be sown broadcast, and thinly. The Rosette Colewort may be sown now for early cutting, and at a later date the Hardy Green, for spring use.

FRENCH BEANS.—A sowing may now be made where the plants can be protected by means of

frames. A west border is a good place for them. For late use, Ne Plus Ultra is a good variety, and the seed requires plenty of moisture in the soil to cause it to germinate freely.

RUNNER BEANS suffer in hot weather from lack of moisture in the soil, the top-growth throwing off the rain, no matter how heavy it may be, and whenever practicable a good soaking of the soil with water or liquid-manure should be afforded the rows. Late-sown plants should be topped at 6 feet from the ground.

PEAS.—A sowing may be made in trenches as for Celery if the soil be light; in heavy soils the trench need be quite shallow, but an open position should always be selected for this crop, and 6 or 8 feet space left between the rows. Veitch's Success last year was our last crop pea, and it was found to be excellent. Sturdy is another fine late pea, and useful in places where space is a consideration, it being dwarf.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HERBACEOUS BORDERS.—Pyrethrum, Pæony, Aquilegia, Helleborocallis, Delphinium, Betonica grandiflora, Lychnis violacea rubra, Tradescantia, Veronica, and other species, are now coming fully into flower. The tufts of Aubrietia Hendersoni and A. Leichtlini are very effective in our garden, and make a pleasing contrast to the pale blue flowers of Myosotis alpestris close by. The only attention required in this department during the next few weeks will be to keep the beds and borders clean, and the latter plants tied up neatly, but not formally, as occasion arises, and to remove decayed flowers and leaves at short intervals of time.

ROSES.—Beds and borders set apart for Roses should be heavily mulched, and repeatedly and copiously watered in the absence of heavy rains. These waterings, together with syringing the foliage and the renewal of the mulching when exhausted, will maintain the plants in vigorous growth, and be productive of large blooms. The spent blooms should be removed from the plants several times a week during the next month.

BRIAR STOCKS FOR BUDDING.—The shoots on the lower parts of the stem and some of those at the top should be removed, two or three of the strongest being sufficient to leave. Mulch the ground, if light, between the rows with half-rotted dung or tree-leaves, following this with a heavy watering, which will insure the bark running readily when budding has to be done about three weeks hence.

TRIMMING SHRUBS.—Hedges should now be trimmed, Yew and Box being clipped, and Holly, Sweet Bay, Portugal Laurel, Retinosporas, Laurel, Thuia, and Juniper should be kept in shape with the knife, simply shortening long shoots a little below the face of the hedge, so that the wounds will not show. Thus trimmed, there are no mutilated leaves or glaring wounds to mar the good effect of the hedge.

WATERING TREES AND SHRUBS.—Trees and shrubs which were transplanted late in the spring should be afforded a good watering at the roots once or twice a week, dry weather prevailing, especially those growing in light soil and a dry situation, otherwise growth will be poor.

RHODODENDRONS, AZALEAS, ETC.—Where these shrubs are growing in numbers, or singly in prepared soil turfed over, the grass between the plants should be cut at least once a fortnight, care being taken not to injure the plants in so doing.

GENERAL WORK.—Continue to pick off all the flowers that show on any of the bedding plants for another week, with the object of inducing the latter to make free growth; and with this object in view, stir the soil between the plants with a Dutch hoe, which operation, in addition to stimulating growth in the plants, will destroy weeds. Spread out and peg down the shoots of trailing plants, also those of straggling habit, viz., Verbenas, Petunias, Heliotropes, and Calceolaria amplexicaulis, to save them from injury by wind, as well as to get them to cover the soil in as short a time as possible. Put stakes to Dahlias and Hollyhocks, and do not tie them tightly, but allow space for growth. Hollyhock stems should be reduced to two in the case of strong established plants, and weaker plants to one. Mowing, cutting the edges of turf, brushing, weeding, and rolling the walks are the order of the day, and grass-mowing having probably got in arrears owing to the pressure involved in bedding-out, may now be got well in hand again.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

SATURDAY, JULY 9—Royal Botanic Society.

SHOWS.

SATURDAY, JULY 2 } National Rose Society's Show,
Crystal Palace.

TUESDAY, JULY 5 } Great Rose Show at Earl's Court;
Rose Shows at Gloucester, Sutton,
and Bagshot.

WEDNESDAY, JULY 6 } Croydon Horticultural and Rose,
Hitchin Rose, Enfield Horti-
cultural, Royal Botanic Society,
at Regent's Park, Evening Fête,
8 to 12; and Rose Show at Earl's
Court.

THURSDAY, JULY 7 } Bath Rose and Begonia Show.
Woodbridge Horticultural and
National Rose.

FRIDAY, JULY 8—Lee Horticultural.

SATURDAY, JULY 9—Reigate Rose Show.

SALES.

TUESDAY, JULY 5 } Established and Imported Orchids,
at Protheroe & Morris' Rooms.

FRIDAY, JULY 8 } Great Sale of Orchids, at Protheroe
& Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63° 1.

We know that many vegetable and fruit products are esteemed rather for their pleasant or refreshing taste, and for their anti-scorbutic properties than for any nutritive value which they may be assumed to possess. Yet even fruits of that character are especially valuable as additions to our daily diet, on account of the potash salts and mild vegetable acids they contribute to the blood. We learn from JOHNSON'S *Vegetable Food of the World* that the grateful acid of the Rhubarb stalk arises from the malic acid and binoxalate of potash which it contains. The acidity of the Lemon, Orange, and other species of the genus *Citrus* is caused by the abundance of citric acid which their juices contain; that of the Cherry, Plum, Peach, Apple, and Pear from the malic acid in their pulp; that of Gooseberries and Currants, black, white, and red, from a mixture of malic and citric acids; that of Grapes, from a mixture of malic and tartaric acids; that of the Mango, from citric acid and a very fugitive essential oil; that of the Tamarind, from a mixture of citric, malic, and tartaric acids; the flavour of Asparagus, from aspartic acid, found also in the root of the Marsh Mallow; and that of the Cucumber from a peculiar poisonous ingredient, called fungin, which is found in many species of fungi, and is the cause of the Cucumber being objectionable to some persons.

It will be observed that Rhubarb is the only product which contains binoxalate of potash in conjunction with an acid. It is this ingredient which renders Rhubarb so wholesome at the early commencement of the summer, though in certain cases, known to medical men, its use may be injurious.

The following table, compiled from some analyses by Professor BÉRARD, shows the per-

centage average chemical composition of five unripe fruits, and of eight ripe fruits, comprising Apples, Pears, Gooseberries, Grapes, Plums, Cherries, Apricots, and Peaches.

Percentage Average Composition of Fruits.

	Unripe.	Ripe.
Water...	85.7	78.7
Albuminoids ...	0.7	0.6
Sugar ...	4.0	12.9
Vegetable acids ...	1.5	1.3
Pectose and gum ...	4.3	3.7
Cellulose, &c. ...	3.8	2.8

The data thus given show that there is a considerable decrease in the watery particles of fruit as it approaches its full ripe character, resulting in a difference of 7 per cent., while the sugary constituents increase during maturation in a corresponding degree, rising from an average of 4 to nearly 13 per cent.

There is very little actual decrease in the percentage of acids from the green to the ripe stage of fruits, but the acidity becomes neutralised by the increase of sugar as the fruit approaches maturation.

Many persons know from experience how much more pleasant and agreeable fruit is when gathered and eaten direct from the tree. This is undoubtedly in great part due to the freshness and briskness of the vegetable acids contained in the fruit, which, when so gathered and eaten, have not time to change into any other substance. Stale fruit, on the other hand, is unpalatable from the very fact that it has lost this pungent and brisk taste.

Pectose forms the substance known as vegetable jelly, and it is to this constituent of fruits that jams owe their firmness. Cellulose is the fibrous part of fruits, and it is in this portion that we should find the largest proportion of mineral salts, potash, &c.

PAMPAS-GRASS IN A LOWESTOFT GARDEN.—

The Pampas-grass has long played a part in the decoration of the flower garden and pleasure ground, but it is seldom that we see the plants arranged in masses in rectangular beds or borders in the manner that is apparent in our engraving of a view in the garden of W. J. LARKIN, Esq., Holm View, Lowestoft (see fig. 3). The grass is here planted in conjunction with flowering herbaceous perennials and others, and forms, when in full beauty, an admirable foil to those. In the marine climate of Lowestoft, especially if sheltered from the sea wind, the plants will suffer less in winter than others at a distance from the coast.

LINNEAN SOCIETY.—On the occasion of the meeting of the above Society, on Thursday, June 16, Professor STEWART, President, in the chair, Mr. J. R. LEESON was admitted, and Messrs. T. COOKE, F. J. CLARKE, and J. MELLOR were elected Fellows of the Society. Mr. F. ENOCK exhibited some specimens of the Mustard beetle, and gave an account of its recent depredations as observed by himself. So numerous was it that, in walking down a single row of Mustard, a distance of 65 yards, he had captured with a butterfly net upwards of 15,000, as he subsequently ascertained, by counting a portion and weighing the remainder. The crop of Mustard thus affected he regarded as destroyed. Mr. GEORGE MURRAY exhibited and described the type of a new order of Algae, to which the name *Splachnidium rugosum* was given. Mr. H. B. GUPPY read a paper on "The Thames as an Agent in Plant Dispersal," in which several interesting facts were brought out, the observations being illustrated by specimens collected by the author, and a useful record given of the effects of exposure to sea water, and of freezing, upon the germinating power of seeds. Professor F.

OLIVER gave an abstract of observations made by Miss M. F. EWART on some abnormal developments of the flowers of *Cypripedium*, illustrated by effective diagrams in coloured chalk. The evening was brought to a close by an exhibition by Mr. CARPENTERS, with the aid of the oxy-hydrogen lantern, of some beautiful slides of sections of fossil plants. A second series, zoological, exhibited by the President, included several minute organisms, of extreme interest. This meeting brought the session of 1891-92 to a close.

ROYAL VISITORS TO MR. BULL'S ORCHID EXHIBITION.—Her Royal Highness the Duchess of EDINBURGH, with the Princesses MARIE and VICTORIA, accompanied by Prince FERDINAND of Roumania, visited Mr. WILLIAM BULL'S Orchid Exhibition, at 536, King's Road, Chelsea, on Monday, June 27.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the committee took place at the Hotel Windsor, on the 24th ult., when letters were read from Sir JULIAN GOLDSMID, Bt., President of the Fund, acknowledging the resolution of condolence on the death of Lady GOLDSMID, passed at the last meeting of the committee; and from Sir JAMES WHITEHEAD, Bart., in reply to the vote of thanks for presiding at the annual dinner. Special donations were announced, as follows: Mr. H. Herbat, Kew, £2 2s.; Proprietors of the Hôtel Métropole, £2 2s.; Mr. G. W. Cummins, The Grange Gardens, Carshalton, collecting box, £3 3s.; and Messrs. B. S. Williams & Son, Victoria Nurseries, Holloway, collecting box in the house of insectivorous plants, International Horticultural Exhibition, Earl's Court, 15s. 9d. The quarterly allowances to the orphan children upon the Fund, amounting to £159 5s., was ordered to be paid.

THE NATIONAL PINK SOCIETY: NORTHERN SECTION.—Owing to its being found necessary to change the date of the Rose exhibition at the Botanical Gardens, Old Trafford, from July 16 to July 22, the Northern Pink Show announced for the same date has been postponed to July 22 also. The cultivators of Pinks are not numerous enough to make a show of themselves, and, therefore, it is necessary to tack the show of these flowers on to some larger show of florists' flowers. So far as we are able to ascertain, the Pinks promise well all round. In the south the flowers are coming finely laced, the season appearing to suit them.

INTERNATIONAL ROSE SHOW AND FETE.—

A floral festival of an unusual kind has been organised by the Directors of the International Horticultural Exhibition for Tuesday and Wednesday next, when it is expected there will be displayed at Earl's Court a collection of Roses, Orchids, Begonias, and herbaceous plants such as has not previously been seen in London. Most of the best English Rose growers will be represented, and many Continental growers will also take part in the display. It will be "Roses, Roses, all all the way;" and if fine weather should favour the affair, a brilliant gathering both of flowers and people may be confidently looked for. But there will be much to attract besides Roses; Messrs. F. Sander & Co., of St. Albans, and other growers, will exhibit a collection of Orchids; and a display of table decorations is arranged for in the main building.

— We are informed by Messrs. WM. PAUL & SON, of Waltham Cross, that they will hold a Rose show at the International Horticultural Exhibition, commencing on Tuesday, July 5 next, and continuing until July 16.

DATES OF ROSE SHOWS.—In addition to the dates of fixtures previously notified in these pages, are Farnham, Wednesday, July 6; Ealing, Tunbridge Wells, on the Wednesday following; on Thursday, July 14, Harlestone; Chester National Rose Society's Show, on Saturday, July 16; Christleton on the Wednesday following; and Ulverston on Friday, July 22.

BOTANICAL MAGAZINE.—The plants figured in the June number are :—

Althea ficifolia, best described as a single Holly-hock, with pale primrose-coloured flowers. Kew, t. 7237.

Eria marginata.—A Burmese species, described by Mr. ROLFE in our columns, 1889, i., p. 200. The sweet-scented flowers are produced from the sides of stalked pseudobulbs, each flower being flatish, star-shaped, with five lanceolate white segments, and a three-lobed lip, margined with red, t. 7238.

Senecio (Kleinia) Galpini.—An undershrub, with fleshy oblong leaves, and heads of orange flowers in

since they have been the subject of the gardeners' manipulations, have exhibited, as might have been anticipated, a remarkably sportive tendency. Very many such have passed through our hands, but never one quite like the present one, whilst Mr. DAVIS, who grows 150,000 or more annually, has never seen such a one.

LIQUORICE CULTURE.—The cultivation of liquorice is stated by the British Consul at Batoum to be considerably increasing. In his report to the Foreign Office on the trade of Batoum during the year 1891, he says more liquorice is exported every

hydraulic presses. Liquorice paste is being manufactured, but has not yet been exported from the Caucasus. About 4500 tons of dry root have been exported by the two factories, representing about 9000 tons of green root manipulated. The remainder exported was from a Greek firm. The number of hands employed by each factory varies from 50 to 300, according to the season, at wages varying from 8d. to 1s. 2d. per day; and at outside collecting stations some 300 more, the greater number being employed in autumn and spring. Nearly all the inhabitants of the district find employment in digging the root at seasons when there is no other work to do.

FIG. 3.—PAMPAS GRASS, IN MR. W. J. LARKIN'S GARDEN, HOLM VIEW, LOWESTOFT. (SEE P. 14)

terminal corymbs. It is a native of the Transvaal, and flowered at Kew, t. 7239.

Porana paniculata.—A tropical Indian creeper, with cordate acuminate leaves, and numerous small white Convolvulus-like flowers, in loose paniced cymes, t. 7240.

Rosa pomifera.—A Rose with handsome foliage, and still more handsome large fruits, figured in our columns, 1886, vol. i., p. 237, fig. 45. Sir Joseph Hooker sums up the botanical history of the species, which others refer to *R. villosa*, t. 7241.

LEAFY BEGONIA.—Mr. B. R. DAVIS, of Yeovil, who makes Begonias a specialty, sends us a male flower of a yellow variety, in which one of the sepals is developed in the shape of a perfect leaf. Begonias,

year from the Caucasus, and the export seems likely to increase, the quantity exported in 1891 being double that of the previous year. It is obtained chiefly in the district lying between Elizavetpol and Hadji Kabul, where it is brought by the natives to various depôts established for its reception by the different firms during the winter months, no difficulty being experienced in getting the quantity required. The price to the natives on the spot is about 25s per ton for green root, the price varying according to the distance from the factory. The green root is reckoned to yield about 45 per cent. of dry. With the exception of a few tons, all the liquorice exported goes to America. Two liquorice factories, owned by Englishmen, are employed in collecting, drying, and pressing liquorice roots by

ASTER ALPINUS VAR. ALBUS.—On the occasion of a recent visit to the highly remarkable garden of the Rev. Chancellor SWAYNE at Salisbury, we could but note amid the host of choice plants there to be seen, the numerous plants of this pretty Composite. Chancellor SWAYNE seems to know how to make his plants, comparatively speaking, equal in size, a point of great importance in a rock garden, where one too often sees the triumph of might over right. The old walls of this charming garden were covered with *Erinus alpinus*, a charmingly decorative plant, which seeds itself freely here.

BEGONIA ROSEBUD—Some flowers of the above novelty have been kindly sent to us by Messrs. CANNELL & SONS, Swanley, but it is only from his

letter that we were enabled to make out that they were the blossoms of tuberous Begonias, and not Balsams, Hollyhocks, or Camellias, so regularly double are they. The colour is soft rose-pink, and the diameter of the largest one $2\frac{1}{2}$ inches. We opine the "improvement" of the tuberous Begonia cannot go farther in this direction.

FLORAL FÊTE AT THE MANSION HOUSE.—A Floral Fête and Bazaar, in aid of the Royal Hospital for Women and Children, took place at the Mansion House on Friday the 24th ult., under most distinguished patronage. The chief display was in the Egyptian Hall, in the centre of which was the Lady Mayoress's circular stand. The crush of visitors was such that it was quite impossible to obtain a general view, and it was only after much difficulty that the individual stalls could be reached. Amongst an abundance of the most exquisite flowers, we noticed some Roses from the Prince of Wales, Carnations from Lord Rothschild, Orchids from Messrs. Sander & Co., and Roses from Messrs. Turner and Mr. Frank Cant. It is with pleasure we are able to report such a complete success.

POISONOUS PROPERTIES IN THE GENUS TEMPLETONIA.—Baron von Mueller writes:—"A fatal poisoning case has just been reported from the Darling River, through *T. egena*. A woman thinking that this leafless plant must have similar medicinal properties to that of the English Broom-bush, prepared an infusion of the *Templetonia*, one cupful of which produced death within an hour! Considering that this genus is in its affinities not so very remote from that of *Gastrolobium* and some other Australian simple-leaved leguminous shrubs, the discovery of lethal effects in *Templetonia* does not come very unexpectedly. As *T. retusa* is much cultivated in conservatories of Europe as an ornamental shrub, material exists also there for testing it as regards any deleterious properties; should such exist, then the poison principles might be isolated even in Europe, where now so many phytochemic laboratories exist with ample special appliances."

EFFECTS OF THE FROST.—Travellers by the Great Western Railway can witness abundant examples of the disastrous effects of the June frosts. In many cottage gardens lying in the Thames valley in Berkshire, the plantations of Potatoes are almost wholly destroyed; so are Scarlet Runners and Vegetable Marrows. The same can, unhappily, be seen in other parts of the country, and in Surrey and Kent, counties favoured to a large extent by climate, similar signs of the destructive effects of the frost can be noted. If only cottagers would take the trouble, as they are often recommended to do, to draw up the soil to their Potato-tops when cold nights at the end of May and early in June are imminent, crops might be saved; and it can be done with a small outlay of labour.

BULB CATALOGUE.—We have received an exceedingly full list of bulbs, corms, tubers, &c., from Messrs. DANMAN & CO., of San Giovanni, Teduccio, Naples. The catalogue is well illustrated, and has the text in German and English given in parallel columns.

FLOWERS IN SEASON.—Canna William II. is a brilliant scarlet, withal, of a soft shade, and equally well adapted for pots or vases, or the sub-tropical bed. We remember seeing a very effective bed made with one of these fine new varieties of *Canna* and the dwarf-growing *Zinnia Haageana*. The former grew about $2\frac{1}{2}$ feet, and the latter, which formed the groundwork, was 9 inches high. Carnation George Fry is a fine thing, which some day everyone will make a point of possessing. The colour is bright crimson, and the form of the bloom is just a little bit irregular, that is, it needs dressing. Both of the above came from Messrs. J. LAING & SONS, Forest Hill, S.E.

FLORAL DECORATIONS IN THE DWELLING.—Indoor decorations with plants and flowers seem

to us to be getting greatly over-done, and we fear there will be a general revolt against the thing, on the score of its extravagant cost, and its glaring artificiality, which will, in the end, inflict damage to horticulture, as seen in the cultivation of beautiful plants. A plant or two of Indian Azalea, unrestrained by stick or tie; a *Franciscea*, a *negligé* *Begonia tuberosa*, with pendulous blooms by preference; a few Palms, with light, tremulous foliage; a *Dracæna*, either green or coloured; an *Acacia longifolia*; *Camellias*, especially the single or semi-double forms, in any colour; *Cantua dependens*, the perfumed *Magnolia fuscata*, a panful of *Achimenes* of the patens type, *Gesnera zebrina*, or a handsome *Cliveia miniata*; a few of these, or such as these, would give more real pleasure to their possessor, and add to the adornment of an apartment to a greater degree than the hundreds of "market plants" that are now so commonly employed by the florists.

REPORT ON FRUIT CROPS IN ENGLAND AND ON THE CONTINENT IN THE PRESENT SEASON.

—The following report, furnished by Messrs. W. N. WHITE & Co., Limited, Covent Garden, will be read with interest:—"In sending you our annual circular showing the results of our investigations into the fruit crops of England and the Continent for the season 1892, we must apologise for it being so late, for the following reasons: 1st, reports were so conflicting that we had to write for fuller information from various places; 2nd, the weather has been so changeable that we waited until we thought everything was safe; but even as late as last week we understand that damage has been done, there having been frost in many districts. In May it was thought that the crops of almost everything would be very good, but the tropical weather that prevailed towards the end of that month soon dispelled these hopes. Cherries alone are the one good crop of the year. Not only in England, but through France, Belgium, Holland, and Germany the crop is considered a full one everywhere. Gooseberries may be said to be one-third of a crop in England; a good half crop in Holland, and a fair crop in Belgium and Germany. France only grows sufficient for their home requirements. Black Currants are a very light crop in this country, not exceeding one-third. In France crops are also light. Holland has about half a crop; and the same may be estimated for Belgium and Germany. Red Currants on the other hand are reported a fair crop, not only in England, but in Holland, from which latter country we get very large supplies; the general report from there is that the crop is good. Plums which at one time looked as if we should again have a fair crop in England, notwithstanding last year's large supply, have disappointed growers considerably; in some districts there are scarcely any. We do not think there will be more than a quarter crop in England, and the same in Holland and Germany, while in some districts in France there are scarcely any, but from the South of France the crop is reported to be fairly good. Greengages are a fair crop in the South of France, but there are very few in the north, and in the champagne district, from whence large supplies come forward to this country, we hear there is hardly a single fruit to be seen. The crop is very light in Germany and Holland, and not more than one-third of a crop in Belgium. Pears.—Crops are very bad throughout England. In many districts there are scarcely any. The same remarks apply to Germany, Belgium, and Holland. France also has a very poor crop. Apples at first promised to be a fair crop in England, but in some districts they are now quoted an entire failure. Where growers have washed their trees, we believe a certain moiety of the crop has been saved, but where the trees have not been washed, in some districts there are scarcely any fruit. Germany is quoted as a very small crop, but through France, Belgium, and Holland, the crop is fairly good. Raspberries.—The continual night frosts of the spring cut the canes severely, and this, followed by the dry weather in May, has left the plants very small, and the crop is certain to be a very light one,

under one half. The same remarks apply to Holland—very few Raspberries come to this country except those from Holland. Strawberries were also so much affected by the frosts in the spring, that in no district have they made their usual growth; the great complaint is the lack of foliage, and the crop is likely to be a very short one—one-third; and, owing to the scarcity of foliage, should we get warm weather, the crop will not last more than fourteen days. Nuts are reported to have suffered in some districts with the maggot. Walnuts are fairly plentiful in Belgium and Holland, but are a light crop in the south of France. Chestnuts are quoted a good half crop.

PLANT PORTRAITS.

CHRYSANTHEMUM: 1, LOUIS BŒHRER; 2, H. BALLANTINE. *Gartenflora*, t. 1370.

CHRYSANTHEMUM KAISERIN AUGUSTE VICTORIA. Semi-double pale primrose, described as "Ein sport des Mary Anderson." *Gartenflora*, t. 1371.

MICROMELES ALNIFOLIA, Kochne, *Gartenflora*, June, 1892, p. 284.

RODRIGUESIA CALOPLECTRON, *Gardeners' Chronicle*, 1883, p. 368; *Gartenflora*, t. 1372.

MEGACARPEA POLYANDRA.

For the opportunity of figuring this strange Crucifer, we are indebted to Mr. Burbidge, under whose charge the plant flowered in the Trinity College garden, Dublin (see p. 17). Before the present day, when the microscopical anatomy of plants almost exclusively absorbs the attention of the student, this was a plant to excite strong interest. A Crucifer without the habitual four long and two short stamens, but with a series of a dozen or twenty, was a thing to marvel at and excite lively commotion among those inclined to morphological studies, while those of a genealogical turn of mind saw in it some far-off connection of the Poppies. The seed-vessel also is remarkable, but more for its size than any other peculiarity, for structurally it is not very different from *Alyssum Shepherd's Purse* and many others. As will be seen from the illustration, one-half only of the seed vessel is here developed, the remaining portion having been arrested in its growth.

NOTICES OF BOOKS.

THE APPLICATION OF ARTIFICIAL MANURES TO FRUIT AND VEGETABLE GROWING, AND IN FLOWER AND GARDEN CULTIVATION.

A VERY useful and practical pamphlet under the above title has just issued from the pen of Professor P. Wagner, Director of the Agricultural Research Station, Darmstadt, which has been translated by Mr. D. A. Louis, F.I.C. The value of the work is much enhanced by fourteen autotype photographic illustrations of plant cultivation, comprising Oats, Barley, Tobacco, Potatoes, Hemp, Beets, Carrots, Maize, Beans, Peas, Coleus, Geraniums, and Fuchsias.

The author says, no one will deny the great progress that has been made in improving the species of fruits, in the treatment of fruit trees, in searching out new kinds of vegetables of higher value, in discovering new sorts of flowers which are remarkable for beauty of colour, graceful and elegant form, and plentiful blossom. Every establishment devoted to the cultivation of flowers distinguishes itself by developments in this direction. But the improvement is only in one direction.

Whilst the farmer knows how much phosphoric acid, how much potash, and how much nitrogen any of his crops require; also in what form they should be applied, and the way to use the manure to the best effect, so as to get the highest possible results; in books on horticulture an astonishing ignorance is displayed on all these topics, and in practice it is no different. Gardens and vegetable-beds are manured generally without any consideration at all. They are dressed with large quantities of stable-

manure, which frequently costs a great deal of money, and, as a rule, contains but little plant-sustaining constituents; no thought being given to the waste of certain ingredients, which must necessarily ensue from an exclusive manuring with farm-yard manure, and no consideration exercised as to how very much more useful this manure could be rendered by an admixture of artificial fertilisers. Plants are dosed with liquid manure, domestic drainage, compost, &c., and it is not known to what a great extent

The author draws attention to the fact that in gardens, especially for extensive vegetable cultivation, twice or three times as much manure is required per acre as is demanded for field cultivation.

The production of garden soil is far greater than that of the field, whereas the farmer must, as a rule, be contented with one harvest in the year; the market gardener endeavours to extract two or even three crops from the soil in the course of a year. By heavy manuring, by great expenditure of labour, by

small number of different kinds of plants. We can easily control this number, and without much trouble can try with each of them, whether the accessory constituents of the manures of commerce act injuriously on them or not. In horticulture, on the other hand, this would present far greater difficulties. In this case we have to deal with a much greater number of species and genera, and we cannot carry out experiments with each of them; moreover, garden plants, various vegetables, the finer kinds of fruits, berries, flowers, &c., are, as a rule, more delicate and sensitive than field plants. It is not improbable that the accumulations of salts, of sulphuric and hydrochloric acid in the soil, injure just those qualities which give the product its particular value.

Double Superphosphate.—Double superphosphate is free from sulphuric acid, and highly concentrated; it contains almost three times as much phosphoric acid as ordinary 16 per cent. superphosphate. This is recommended to ensure a very rapid and vigorous early development of plants. For with Vines, fruit trees, berry-bearing shrubs, &c., a great deal depends upon their producing leaves rapidly and abundantly in the spring, also upon the blossoms appearing at the right time, upon the fructification ensuing vigorously, inasmuch as the more completely all these phenomena take place the more certain are the prospects of a harvest satisfactory both for quantity and quality. In the case of kitchen plants and all seedlings, it is also of great advantage to make these develop rapidly and vigorously, in order that they may recover as soon as possible from the ravages made upon them by insects, frosts, and bad weather, and that they may elaborate as quickly as possible a widely-distributed and deeply penetrating network of vigorous roots, and in this way acquire so much vital energy, and so much power of resistance, that they can encounter with successful opposition all inimical attacks.

Phosphate of Potash.—It is generally known that plants do not live on food consisting of single nutritive substances, but on food compounded of different nutritive substances. If potash is wanting in the soil, then the phosphoric acid cannot act; or if the nitrogen is not present in sufficient quantity, then neither the potash nor the phosphoric acid become active. Each different plant has to be supplied, according to its requirements, with the necessary quantity of readily-assimilable potash and easily available nitrogen.

Vineries.—The Vine affects a soil very rich in food-material; it apparently possesses a comparatively feeble power either for the appropriation of slightly soluble soil-nutrients, or for utilising a soil solution poor in food materials. It appears advantageous for the vitality and bearing capacity of the Vine to have even the lower layers of the soil abundantly supplied with soluble nutrients, so that the roots penetrating into these layers can be well nourished, and made to develop vigorously. But a plentiful supply of plant-food can only sink into the lower layers when the surface is supplied with a great excess, and when the quantity removed by the harvest is replaced annually. In accordance with the practical experience of Vine-cultivators, to bring a vineyard to a healthy, vigorous, and fruitful condition, and to retain it in this condition in order to obtain from it the greatest possible profit, one must set out with an application of potash, phosphoric acid, and nitrogen far above that of the usual farm-yard manure dressing.

Orchards.—Most fruit-trees are badly nourished; they, consequently, not only yield badly, but at the same time suffer from adventitious dryness, from sudden changes of weather, from insects, and all sorts of sicknesses, far more than they would do were they better cared for. The more vigorously a tree is nourished, the more active are its organs in presenting a stronger resistance to all disturbing influences, and the greater is its power to remedy any injury that has happened to it.

Pot-cultivation.—Pot-plants starve when they are not manured. The quantity of earth supplied, even when the pot is comparatively large,

FIG. 4.—MEGACARPEA POLYANDRA. SEED VESSELS OF THE NATURAL SIZE; FLOWERS AND POLLEN ENLARGED. (SEE P. 16)

the use of phosphates could improve the yield and the quality of fruit, and the beauty of flowers, &c. Plants are set in pots, in garden-soil, and nobody realises how plants starve in such a small quantity of soil; how they sicken; how they fall victims to fungi; how they suffer from rotting roots, because they starve for want of nourishment.

It is impossible to say how much more easily and conveniently, and how much more successfully, and with what greater financial advantage, vegetable gardening, garden cultivation, flower-raising and growing, could be conducted, if a rational system of plant-sustaining were introduced.

artificial watering, by concurrent cultivations, and suitable sequences of plants, the gardener induces such a high production, that twice, thrice, or even four times as much phosphoric acid, nitrogen, and potash are converted into harvest material from his soil than is possible in the cultivation of farm crops.

Manuring and plant production are immeasurably heavier in vegetable growing and gardening than in farming. With the heavier manuring, the accessory constituents of certain manures accumulate to such an extent, as to engender the fear of a deleterious action in the development of vegetation.

In agriculture we have to deal with a comparatively

offers far too little space for the roots to spread, and the amount of soluble food-material in the soil, even when the richest hotbed soil is employed, is far too small to induce the plant to develop.

Healthy, vigorous, richly-blooming plants are not in the least difficult to obtain, so soon as a man has disentangled himself from the erroneous idea that pot-plants are only sensitive to thirst, and only want water, and always more water to drink, but never in any way suffer from hunger. It is just pot-plants which must be plentifully and carefully nourished, in order that they may better overcome the comparatively unfavourable circumstances under which they are placed.

Chamber-plants and greenhouse-plants live, in fact, in captivity. The open air, the undiminished light, the direct sunshine, the dew, the rain, the morning atmosphere, the broad and deep extent of soil, the good aëration of the soil, the even distribution of the soil-moisture—of all these the plant living in captivity is deprived, and when, in addition to this, it is allowed to starve, then much cannot come from its development.

We must leave the subject here, but recommend a careful perusal of the forty-six pages of most useful and readable material. *J. J. Willis, Harpenden.*

EVERYBODY'S POCKET CYCLOPÆDIA. (Saxon & Co.)

This little book is certainly a most wonderful epitome of general information, and the tenth edition contains even more than did its predecessors, being furnished with much new matter, and various maps. The full index is also an improvement, and the whole is a most handy volume for the pocket or the library table. The cost is—sixpence! Every gardener will find it useful.

FOREIGN CORRESPONDENCE.

CALIFORNIA AS A HOME.

I DID not mind when my article in the *Gardeners' Chronicle* of February 20 was answered in the way Mr. Carter, of Cheltenham, wrote (March 5), as his words recorded an exceptional case. But I am in the receipt of letters relating to that subject, informing me that my reliability is seriously questioned in consequence, I am obliged to ask for a little space in this journal, much as I hate to make a universal paper like this, in which every reader over the whole globe looks for truthfulness and reliable information, a place for more or less personal controversy. Does any reader believe that 1 acre of land is worth 100 dols. when the product of it has to be hauled "from 10 to 20 miles, as the case may be?" And that in a country where the population is so thin that millions of acres are for sale on more than cheap terms just for the very sake of attracting emigrants to settle up the country? And if it was worth 100 dols. per acre, would Grapes be the proper product to put out, if they had to be hauled 10 to 20 miles? I live here 19½ miles away from the railroad, and it would be an impossibility to haul Grapes over roads as rough as mountain roads are, anything like such a distance. The consequence is, that Grapes are worth 18 to 20 dol. per ton. I heard considerable complaint from below, when three years ago Grapes were worth but 8 dols., and that in consequence of a production so plentiful and abundant that the vineries could not buy them, having the product of previous years still on hand. There are Grapes grown everywhere which are actually not worth picking on account of being grown on too cold a hillside, or because they are a kind not fit for wine. Such must have been the case when Mr. Carter was rolling his 20 miles, and was offered 5 dols. Surely that is absurd. If Mr. Carter had to work his vineyard for five years before realising a crop he was one whole year behind time. And if locusts happened to appear one year, as they will sometimes in California, there was no reason to be permanently discouraged. As to "other causes which spoil his

crop," I challenge Mr. Carter to name one before engaging in commonplaces. When I mentioned "that Grapes would not ripen in San Francisco," I did so to show the great variability of the climate, and nobody could take it as meaning that the hills of our city were covered with Vines. Mr. Carter "never could get more than about 1 cent per lb. for Peaches." I will speak by figures. At 20 feet distance the acre will contain 108 trees. They bear the third year, the second if you let them. The fourth they average easily 50 lb. to the tree, or 50 dols. to the acre at Mr. Carter's figure. Is that not enough return on an outlay of 100 dols. (which you are never asked unless in localities too favourable to be sold for fruit growing, and is kept for real estate speculation)?

If the reader should be interested enough to refer to both our articles, he will never find that I said "We have no rain from one December until the other." Our rains begin in October, and continue more or less to the middle of May. Mr. Carter knows better, if ever he was in California.

I never yet heard of taxes averaging 3 dols. in the hundred. They may reach 2 dols., provided the country is making extraordinary improvements—hospitals, bridges, &c. In such cases, everybody pays his dues. We surely do not need the sympathy of our readers when Mr. Carter tried to make out that our wives might be fortunate enough to have brooches and earrings to be assessed for. We do better than that, though we are not able to pay 100 dols. per acre for hill land. Mr. Carter talks about hundreds of acres. Let me say, he only paid for 200—that would be 20,000 dols., or £4000. Every bank in this our blessed California pays 5½ per cent. per annum. Mr. Carter would have done better if he had put his money in a bank, that other people might have had a chance to work with it, and spend the rest of his days on the £1 of interest we gladly would have given him for nearly every day in the year.

My first article was written out of mere interest for the thousand-and-one gardeners in poor positions in the old country. I told them in the purest disinterestedness that I had found the "Golden West," and that they might do likewise if they chose to. But I warned them not to engage in anything without knowing what they were about. *Geo. Hansen.*

HOME CORRESPONDENCE.

LARCH DISEASE.—Mr. H. J. Elwes, p. 815, *Gardeners' Chronicle* for June 25, tells us that "some of the largest, finest, and healthiest Larch in England, about a hundred years old, are now growing on a very thin calcareous soil, not chalk, but oolitic limestone," and as this appears to be a very exceptional case, and as the term calcareous, as applied to soils, is a very vague one, and apt to lead to confusion, Mr. Elwes would confer a favour on other planters as well as myself if he would kindly state the percentage of lime which his soil contains. *J. B. Webster, Planter and Wood Surveyor, Fairview, Stangmore, Dungannon.*

I agree with Mr. Elwes in thinking that the injury to Mr. Wilson's plantations did not arise from their being planted upon a chalk sub-soil. I have planted Larch on thin soil upon chalk extensively, and have no reason to think that they will not grow well upon chalk. I have seen young Larch injured by the fungus quite as much on various other soils as on chalk. Mr. Elwes refers to the *Coccus laricis*. I have often seen young Larch not healthy, apparently from other causes, attacked first by the *Coccus*, succeeded by patches of fungus, the trees at last dying. The cause of Mr. Wilson's Larch dying was, I should think, probably in the first instance, the severe frost of May 18, 1892, which made the trees unhealthy, and liable to attacks from disease. I remember a similar frost many years ago destroying many acres of Larch plantation in the neighbourhood of Helmsley in a similar manner. The question of the comparative power of Larch raised from native and foreign seed to resist cold and disease is an important one, and I should like to have the opinion of growers, especially in Scotland, as to their experience thereon. I think that some

of them are in favour of native-grown seed, but any evidence of the results of actual trials would be very valuable. *C. W. Strickland, Hildesley, Malton, Yorkshire.*

DEW, AND ITS ACTION ON PLANTS.—Although it may be a fact that the beneficial action of dew, in itself, has been over-estimated, yet the statement made by Mr. J. Matthewman (in an article bearing the above title in your issue of June 11), to the effect that "the generally-accepted theory of the formation of dew has been proved to be incorrect," is not likely to receive much credence unless some sort of evidence is given in its support. It is rather a pity that the writer of the article in question does not mention a few at any rate of the experiments upon the results of which Professor Wollny bases his "weighty" arguments, for the question is one of some practical importance to gardeners. The one solitary instance in which Mr. Matthewman makes any attempt to support his statement by reference to experimental fact, is that where he quotes the observation of Wollny that in a certain field "the dew was sometimes much heavier in one place than in another;" but no one possessing the slenderest knowledge of elementary physics, can therefrom draw the cock-sure conclusion that "the quantity of dew deposited depends upon the moisture of the earth." In the absence of serious argument, the refutation of Professor Wollny's new-fangled doctrine is, of course, out of the question; and until the generally-accepted theory has been proved to be untenable, I, for one, shall continue to hold that the poets are right in the "supposition" that has provided them "with many beautiful comparisons." *C. W. Herbert Greaves, Bournemouth.*

I do not like Professor Wollny's theory of dew and the oozing out process at all (vol. xi., p. 753). I had long since come to the conclusion that its formation depended on the volume of moisture in suspension in the atmosphere, the temperature of this, and the subjects exposed to it. Plants are not the only objects that receive dewy deposits, for it may be seen on iron rails, hard-surfaced stone copings, painted wood and glass, or any other object that becomes sufficiently cooled, and is comparatively non-absorbent. Surely none of these can abstract the moisture from the earth, and if the professor has proved "that dew is not, as is generally supposed, formed by condensation taking place in the atmosphere immediately over the plant," perhaps he or Mr. Matthewman, who has trotted him out, will explain the presence of moisture on the substances referred to, and, indeed, even on fabrics, which the professor can verify if he thinks fit to spread his coat on a table or a hedge some dewy night and leave it there until morning; he will find it so bedewed that it would be risky to wear it without first exposing it to heat to dry. Why may not plants be the recipients of similar deposit? I concede that lack of moisture in the soil will materially lessen the dew deposit, and I notice that pot-plants in our glass-houses when already gorged with moisture exhibit moisture on their surface sooner and more copiously than those comparatively dry at the roots, or bordering on flabbiness; but I always credited the absorbing capacity of the leaves with the difference; and I have entertained the idea that the leaves of a plant replete with moisture are cooler than those that are dry and flaccid; and if this is so, it will account for the sparsely dewy deposit on the latter, for it is certain that the temperature of the object regulates the quantity deposited. Gardeners are familiar with condensed moisture or dew (I must have it this way) on Grapes in the morning, towards autumn-time, when there is no trace of it on the foliage. Now, if we accept the oozing-out theory, one would expect to see the moisture on the porous leaves first. Here, again, I am led to believe that the berries are so much colder than the foliage; hence, the copious condensation. The same thing would happen if a sheet of metal or a roofing-slate were laid by the side of the professor's coat as suggested. As to the value and the effect of dew, I will not say more now than that gardeners lay as much stress on the importance of an atmosphere holding in suspension a certain amount of moisture as they do on the wetness of the soil. *W. P. R.*

SAXIFRAGA MUSCOIDES ATRO-PURPUREA.—I have little doubt but that the plant cited at p. 734 in the last volume of the *Gardeners' Chronicle* as *S. m. rubra* is that which is generally known under the name given above. It is a neat and compact plant, producing quite a mass of its flowers in spring. Your correspondent, "E. M.," speaks of

it as one for a shallow soil; but if the soil be very thin, the plant is liable in warm, dry summers to be stunted in growth, and the flowers few the following spring. To get the maximum number of flowers from the plant, it should be broken up once in two years, in the months of September or October, and planted over a large space of dug ground, a few inches apart; and by the arrival of spring these bits will have nearly met. Where left alone for a longer period, it is liable to get drawn in the centre, and deterioration set in. It is an excellent plant for planting in crevices of rockwork, or for forming a carpet on miniature rocky ravines, and in other similar spots. *J.*

FRUIT CROPS IN KENT.—I am afraid the fruit crops will suffer very much from the fogs at night, and the bitter east wind which is now prevailing; though I believe we are favoured just here with the Cherry crops, but they have changed within these few days. *C., Sittingbourne.*

SAXIFRAGA ARCTIOIDES PRIMULINA.—This has been one of the most charming of all the Saxifrages this spring, and even now the last few of its flowers are only on the wane, a fact accounted for, perhaps, by the situation, which is somewhat shaded till about 3 p.m. daily. Notwithstanding this, it thrives, is in the best of health, and flowers with its usual freedom year by year. Among the rarer forms of the crusted section it is a veritable gem, one which has never been anything but rare, and one which will long remain a scarce plant. In its very slow growth the plant is a match for *S. diapiensoides*, *squarrosa*, *Tombeana*, and such like; but in its flowering it surpasses, in my opinion, all these by the daintiness of its flowers of clear primrose-yellow, so profusely borne on the slender stalks of only 3 or 4 inches high. It seems to thrive well in loamy soil, to which may be added with advantage some sharp grit, old mortar rubbish, and charcoal. My specimen I have grown for upwards of five years, and it is now no more across than a florin, half of which growth has been made with me. It is one of the legacies left us, I believe, by the late Mr. J. Atkins, of Painswick, and a charming plant when in full flower. *J.*

STRAWBERRIES.—If we judge by the large quantity of Strawberries now in the market, and offered so cheaply in shops and on barrows in every direction, it seems evident that in spite of some fears to the contrary there is a good crop generally after all. The very dry weather which prevailed during the spring, and the numerous white frosts which so generally prevailed during the blooming time, very naturally induced fears that the crop would snuffer; so far, however, there has been little to complain of. What those who like Strawberries and are necessarily dependent upon shops or markets for their supplies, have to complain of, is the exceeding lack of quality found in the fruit they can purchase—why is that so? It is because all the largest-fruited varieties have the least flavour. Some have none whatever; and market growers, because these inferior varieties produce the largest fruits and heaviest crops, grow these only, whilst superior varieties that it would be real pleasure to consume, are not to be had. Strawberry raisers are somewhat to blame for this, because they have put so many of these large showy fruited varieties into commerce, and have given to us very few that have flavour. Mr. Laxton's last seedling, *Royal Sovereign* (see fig. 5, p. 21), is perhaps, the best flavoured form that prolific raiser has yet produced, and it would seem as if it deserved wide cultivation. But then it is not at all of the dimensions of *Noble*, or *James Veitch*, or *Waterloo*, or *Sir Joseph Paxton*, and is hardly likely to become a favoured market variety. What a pity it is that we cannot obtain good flavour in these large-fruited sorts; but the combination seems to be an impossibility. In reality we have few varieties that are esteemed worthy of wide cultivation, which have marked flavour. The *British Queen* type can be well grown only by the few, they are failures to the many, and out of 100 so-called forms in commerce we have none that come near to *British Queen*. With such an exceeding number of fine-fruited, free-cropping Strawberries in cultivation now, surely we can afford henceforth to certificate none which do not give high flavour with other merits. *A. D.*

PROFITABLE FRUIT GROWING.—The recent letter of "Pomum" has put the above matter in its very brightest light. The prospect held out by him to the small fruit grower is highly seducing. "D. T. F.," in your issue of June 4, has taken some

of the gilt off the gingerbread, and his remarks *apropos* of soil and site are well to the point. If it is sought to prove that "small holders" may secure considerable profits by growing fruit for sale in open market, the delusion should be dispelled. I believe it has never been contemplated under the Small Holdings Act that landlords should be compelled to part with the best sites for fruit-growing which they possess, and the compulsory clauses, such as they were, have now been altogether rejected. The advantages of site, and a soil prepared through many long and careful years, are all on the side of the landlord, and he, as a rule, is a competitor with the tenant. Two days ago I was in a magnificent garden, where every fruit and vegetable was grown to superabundance, and in perfection. The garden was part of a fine old estate, rented for the time to a very wealthy man—a retired bootmaker. The gardener told me that nearly all the produce went to market, and when I inquired what prices he got for some things, he said, "Oh, we take what price is offered." The moral is plain. Against such as these, the small holder cannot possibly compete. He can never have capital sufficient to bring new ground into the required state of perfection. Let him be content to acquire just sufficient ground to grow for his own use, but do not attempt to persuade him that he can grow profitably for the market. The result of passing a compulsory clause would, of course, be to furnish that full justification to the landowner, if any were needed, for pressing his competition with the small holders to the furthest limits, so that the certain result, in any case, is the failure of the latter. These and other little points should, I think, be carefully laid before intending occupiers of small holdings. Nothing can be said in disparagement of the landlords; they are completely justified in growing and selling what they like; nay, more, they are in duty bound to wring from the soil every atom of life which it can produce, and having done this, to offer it as food for the people. *Edward Nash, Captain, late R.A., F.R.H.S., Tutsfield, Westerham.*

SELLING ROSE BLOOMS AT EXHIBITIONS.—I heartily sympathise with Mr. Findlay in his troubles at the Manchester Rose shows. It seems to be the practice at these exhibitions for exhibitors' assistants to push the sale of spare blooms, and the blooms generally after the exhibition is closed. It is an objectionable practice, and Mr. Findlay's complaint comes in good time. At the Moseley Rose Show, of which I am the manager, we desire to make an appeal to the exhibitors to stop the practice, and hand over to us the staged blooms at the end of the day; also any spare blooms, to be sold by ladies who will take the matter in hand, for the benefit of our children's hospital and the Gardeners' Orphan Fund. It is carrying out a long-cherished idea that flower shows should do more for charity than is done, and we shall try the experiment at Moseley, and have orphan fund collecting boxes as well. *W. D.*

COAL-TAR AS A SAFE GUARD TO THE BARK OF YOUNG TREES FROM CATTLE AND OTHER ANIMALS.—There is no doubt that coal-tar smeared on the bark of young trees prevents damage from cattle, and sticks that have been smeared with it and stuck into mole-runs will drive the moles away. I am told it is also effectual in ridding places of rats and mice, if placed in spots frequented by these vermin; at the same time, I think it would have been well if Mr. Dyer (see your report of Mr. Dyer's very interesting and instructive lecture at the Drill Hall, on June 21, vol. ix., p. 816) had issued a caution along with his recommendation as to the use of this article. Though no case of damage from it has come under my own immediate observation, I have more than once heard of young trees having been destroyed by too thick or heavy an application to their bark. A very little suffices to keep the animals off—just a thin smear on those parts within the reach of horses, cattle, sheep, hares, and rabbits; it adheres and retains its efficiency for a long time. Though I have often used it, I have always been careful not to apply it too thickly—at least, to young trees. Very young trees, fruit trees, osiers, &c., frequently receive great damage from rabbits and hares, and for very young trees—I mean of one or two years' growth—unmixed coal-tar is, I think, quite unsuited, and would take too long to apply. I can recommend as perfectly safe and effectual in protecting tender young trees from ground game, the following, and I believe it is equally good against animals of a larger kind:—Mix clay and stable or farm-yard manure into a paste, a small quantity of soot may also be added, and just flavour the mixture with a little paraffin

(petroleum) oil or coal-tar; either or both of these will do no harm, but a very little of them suffices. If stable or farmyard drainings are not to be had, slop-water from the dwelling-house is almost if not quite as good. Of course, the materials should be thoroughly mixed, and the consistence should be such that the smear can be conveniently used. If "thin," it may be expeditiously put on with a common whitewash brush; or an old paint brush, or a wisp of old sacking, if "thick." I know of no better mixture than the above for the parts of Apple trees affected by American blight. If the mixture is made "strong," care should be taken to avoid touching the foliage with it. If smearing the foliage cannot be avoided, the mixture should be made somewhat weaker with water. *J. E. Ewing, Havant.*

A POPPY AMONGST ANTS.—Can anyone explain the reason for this Latin proverb, of which I cannot test the truth here, where ants are scarce? In the "Triummus"—one of the Westminster Plays—of Plautus, a spendthrift's money is said to have been squandered amongst the purveyors of luxuries, and "quickly finished, like a Poppy amongst ants." *C. W. Dod, Edge Hall, Malpas.*

A PRETTY COMBINATION.—On visiting the seat of P. Ralli, Esq., Ashted Park, Epsom, the gardens of which are well managed by Mr. G. Hunt, I observed on the back wall of one of the plant-houses *Ficus repens*, on which was a plant of *Clerodendron Balfourianum*, and flowering magnificently. The dark foliage of the *Ficus* threw into effective relief the large panicles of scarlet and white flowers of this well-known variety of *Clerodendron*. *B.*

RHODODENDRON FALCONERI.—On p. 695, vol. ix., a correspondent at Ipswich, describes the flower of this as "shaded lilac," and mentions that it has flowered with him in the open air for the first time. A year or two ago your columns contained a description of a specimen in flower in the open air at Appin, Argyllshire, which had grown without protection for many years. It has flowered freely this year, and the trusses are not lilac but of a primrose colour. Can any of your correspondents say if there are varieties differing in colour? *W. D. S.*

CANNED AND PRESERVED FRUITS.—Permit me to endorse, and, if possible, add to all that "A. D." so well says in praise of these (p. 534). The growers are doing their part well in pushing the sale of the different brands, and doubtless find their reward in more or less substantial profits. The trade in Raisins and Currants fluctuates considerably according to the season, and the severe frosts of last April that have caused such havoc in the French and other continental vineyards will have greatly curtailed supplies, or raised prices, or both. It is not, however, needful to disparage the use of time-honoured customs which sanctioned fruits with a view of pushing the trade in caoned, candied, bottled, pressed or dried Apples, Pears, Plums, Apricots, Cherries, Gooseberries, and Currants. Before the fruit season gets too far advanced, I wish especially to direct the attention of fruit growers to the possibility of adding greatly to the returns this year through the bottling or candying of Gages and other Plums before stoning. Not the least delicious of these fascinating mixtures of French or other candied fruits, arranged so tastily in boxes, set off with silver, golden, or crimson paper, are the green candied Plums, obviously candied in sugar before the stones harden. Plums, notwithstanding the break-down crops of last year, and the stinging frosts of this April, promise well. Should they show another such crop as last year, no one can doubt that the ripe sample would be so improved by thinning off, say a half, before the stoning, as to make more money of the half than the whole crop. The price of the green would therefore be all clear gain, minus the thinning off and sending to market. If any of our large houses, such as *Crosse* and *Blackwell*, would advertise for green Plums for bottling, and candying at once, a much-needed fillip would be given to the starting of a new industry, which would add substantially to the profits of Plum and Gage growing. The large growers will hardly have it that Gages are Plums—long spoken of as less Plum-like than *Damsons* and *Bullaces*. Of course, the use in preservation of green stone fruit is by no means an innovation. Young Peaches, Apricots, and to a lesser extent Plums, have been used for tarts and preserves from early times. But what is not advocated is the wholesale thinning of green stone fruit before stoning, to save those left from dropping,

raise the value by improving the quality of the ripe fruit, and ensure the commercial value of the thinnings, and the preservation of the health, vigour, and fertility of the trees. *D. T. F.*

ROSE SHOWS.—Mr. Bruce Findlay draws attention to what he considers a nuisance, namely, that exhibitors of Roses should be allowed to sell any blooms before the show is over. I entirely disagree with him. Where the nuisance comes in I fail to see; surely non-competitive exhibitors are allowed to do what they like with their surplus blooms, for what is there in many cases to compensate him for the expenses he incurs in showing, if he is debarred from selling his blooms? Simply because Mr. Findlay has at some time or other been asked to procure some blooms for a friend, is it in future to be considered a nuisance for an exhibitor to dispose of his blooms? I for one say emphatically, "No!" What chance is there to sell at the close of a show, when everyone is turned out, before any plants can be removed? *J. G. Hill.*

SCOTLAND.

NOTES FROM EDINBURGH.

THE Botanic Garden of Edinburgh at this season is largely visited by the public, especially those who can spare a few hours to enjoy the retirement afforded by the Arboretum, now in its most pleasing garb of young foliage of many tints. In that part of the gardens there is great wealth of varied foliage just on the point of full development, consisting of sombre-hued Conifers and flowering shrubs; and these together, with the very numerous hardy-flowering plants in rock garden and herbaceous borders, a lover of plants can spend hours in acquiring a knowledge of. The flowering shrubs that are most conspicuous at present are pontic and mollis Azaleas of every shade of colour; Rhododendrons, Daphnes, Cytisus, Crataegus, Lilacs, and Gueldres Roses, and these are interspersed with dwarf Conifers, Retinosporas, Yews golden and green, also Aucubas and other choice evergreen subjects, which no doubt were planted with much judgment; but like many other similar grounds, crowding comes on imperceptibly, and it is difficult to make up one's mind to thin out fearlessly. This reminds us of the controversy which has (uncalled for) appeared of late in the public papers regarding some clearance made in the Edinburgh Botanic Gardens, where the ground has been laid down in turf; and all who have seen this, and are capable of understanding right from wrong in a garden, will be pleased at the finished improvement, and what would add greatly to the beauty of this particular garden would be still greater clearances, and the increase of green sward. The temporary disfigurement would, of course, cause some amount of fault-finding, but in the end it would be pleasing even to the most fastidious, carping critics. Many of the finest demesnes in the country are being allowed to go to ruin by neglecting to thin in time trees and shrubs which were in the first place planted thick to give shelter, but were never intended to be thinned too early. We could name many well-known parks and grounds planned by Brown, Loudon, Marnock, and others, where tree and shrub are grown so thickly together that they are past being dealt with safely, and will remain in a pitiable plight till, in course of time, they will have to be rooted out.

Many who would wish to have a fine spring garden (after the style so finely done at Belvoir Castle), may be able to take notes of plants in vast numbers in this Botanic Garden which would meet the purpose indicated. Alpines and plants suitable for the wild garden and subtropical displays are in abundance, showing their true characteristics at the present time. Rhubarbs of many species are now approaching their best, and for bold planting by lakes, margins of plantations, and positions where they can show their natural habits uncut and untrimmed, they form bold effective masses, some of the species attaining to great size. I admired a border that was filled with these plants, where they were set wide apart on purpose to show their natural forms. Rheum

Collianum, *R. palmatum*, *R. officinale*, *R. sibiricum*, *R. hybridum*, were about their best, and others that were coming on formed a very interesting group by themselves. *Rumex* is a very distinct class, and many species were very telling; *exaltatus*, compacta, aquaticus, and some others were very attractive. *Polygonums* make a fine display. Some of those in full flower were *bistorta major*, *alpinum*, *divaricatum*, and *Sieboldii*; *Euphorbias*, *glareosa*, *glaucescens*, *Kunzei*, were fronted with *E. Lathyris* and *Cyparissias*, all finely in flower. The dwarf *Daphne Cneorum* filled odd spaces with fine effect. Many species of *Iris* are well worthy of a place in any collection, however choice. *Irisae florentina*, *orientalis*, *furcata*, *nepalensis*, *prismatica*, *triflora*, *lavigata*, *amena*, and *sikkimense*, were conspicuous amongst others, which formed a delightful bed. The flowers of *Iris* are of much value for cutting at this season. Among yellow flowers, *Anthericum chryso-bactron* and *Hemerocallis flava* showed well; *Archangelica decurrens*, *Fernla conspicua*, with peculiar foliage; *Heracleum gigatum*, tall and conspicuous, with large heads of white flowers; *Inula Hookerii*, a showy yellow flower; and *I. glandulosa*, are all pretty plants. *Saxifragae* are in great variety, many of them being very dissimilar. Some broad-leaved and some small and mossy-like *Hippocrepis comosa* carpets the ground with its yellow flowers; *Orobus luteus*, a peculiar bronze; and *O. coccineus*, 1 foot in height, and possessing fine rose-coloured flowers, were in bloom. On one side of these important beds is planted a long line of the dwarf, compact *Retinospora plumosa aurea*, which indicates how fine a plant this is for decorative purposes when kept dwarf, and associated with flowering plants.

In the rock-garden there is a beautiful and interesting display; and this quaint rockery, with its stone square boxes, contained many gems in flowers. *Achillea argentea*, dwarf, with white foliage, is very pretty; *Aubrietias*, in variety; *Dianthus fragrans*, *Orchis maculata superba*, dwarf and creeping *Phloxes*, *Heaths*, *Berberis*, *Iberis*, forming sheets of white bloom; *Yucca*, *Lithospermum prostratum*, *Ranunculus* of many species, *Veronicas*, *Clintonias*, and *Genista pilosa*, were conspicuous. One may inspect this charming spot every day, and be sure of finding something of interest. *M. T.*

SUNLAWS.

Sunlaws estate lies along the Teviot, about 3 miles south from Kelso, and 6 miles south-east from Jedburgh; the old road passing between those towns runs right through the estate. Little more than sixty years ago a thick forest of Scotch Firs, mixed with some hard-wood, occupied the space where now stands Sunlaws House, surrounded by its beautiful grounds. The late proprietor, who succeeded to the estate at that time, and died only two or three years ago, must have been a man of rare taste and intelligence. He made large clearances according to a well-defined plan; all the hard-wood trees that were sound were spared. But he commenced a system of planting and beautifying which was continued till his death. The results are seen to great advantage now.

Everywhere are met grand specimens of Oak, Ash, and Beech—clean limbed and healthy; and here and there appear dark and sombre masses of Firs, showing what our ancient forests may have been like. But all around those, or mixed with them, are splendid trees of more recent growth, and in almost endless variety. The useful and ornamental are finely blended, and the selection and planting must have been conducted scientifically, for an unhealthy or badly-grown tree or shrub can hardly be found. There is a fine collection of Conifers. Much time and money must have been spent in making it, and the late laird must have been a thorough arboriculturist, and must have had good men about him, for each species seems to have been planted in the soil that exactly suited it. I several times tried to form a list of the Conifers, but I was ever coming upon another species, and my list is still incomplete.

The ornamental trees and shrubs are a magnificent collection, and are beautifully arranged. The

foliage is now approaching perfection. Since the third week of May the blossom has been worthy of a fairyland. The Laburnum (two kinds), the Lilac (three colours), the Gueldres Rose (three kinds), the Cherry (three kinds), the Elder (three kinds), the Hawthorn (a great variety), the Strawberry Tree, besides the *Berberis*, the Mahonia, and the heavily-perfumed Azaleas, form delightful groups in unexpected corners. I have seldom seen finer specimens of the Spanish and Horse Chestnuts. The pretty and peculiar Scarlet Chestnut (*Pavia rubicunda*) I have never seen attain to the same perfection as here. But the Rhododendrons are superb. You come upon them in pretty sheltered hollows, or in knolls of blazing colour, peeping from the woods down upon the Teviot. But the great show is the Rhododendron Drive. This is the chief drive through the grounds, and runs from south-west to north-east for a distance of 2 miles, with some pretty turnings and windings by the way. A wide clearance has been made for the drive along the whole way, and the old wood stands as a fine background on either side. Some of the finer Conifers and ornamental flowering trees and shrubs have been planted in front of the old trees. Then along both sides of the carriage way, in front of the ornamental trees, and behind a grass margin of about 10 feet, run the banks of Rhododendrons. They seem to be of almost every known variety, and they run from the showy white of elegantissima to the purple of Amilcar and plum colour of Alaric; or from the softer white of Cunninghamii to the deep crimson of Clothilda, through every gradation of colour. And the massive and compact trusses of bloom literally clothe the plants from the ground to the highest branch. A bank of healthy Rhododendrons in full bloom always reminds me somehow of a magnified and coloured coral reef basking beneath a tropical sun. Each plant exhibits its individual habit of growth. There are almost endless varieties of shape, colour, and size. But the beauty of the whole, when massed together, must be seen in order to be realised. These plants vary from 6 to 15 feet in height, and when a mass of them, extending to over a quarter of a mile, breaks upon the view, one stands in admiration.

Sunlaws estate stands about 250 feet above sea level. It is about 34 miles from the sea, and the winter frosts are sometimes of great intensity. Yet the frosts do not seem to do much damage, if one may judge from the show of blossom this summer. The soil is not of the orthodox sort recommended for Rhododendrons. It is light sandy loam, rather poor, but with plenty of moisture.

One is often sorry in these days to see places which have been improved at great expense and, for many years, allowed to go to wreck by new heirs. That, fortunately, is not likely to happen to Sunlaws. Captain R. Scott-Kerr, like his late father, is an enthusiastic arboriculturist, and he has a worthy second in his head gardener, who, under a modest manner, hides the enthusiast; and it is worth knowing that strangers may wander through the grounds at their own sweet will, and are courteously treated to any information asked regarding trees and shrubs. *A. E. W.*

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

JUNE 21.—Present: Mr. Morris (in the chair), Mr. McLachlan, Dr. Russell, Dr. Muller, Rev. W. Wilks, Dr. Bonavia, Professor Green, and Rev. G. Henslow (Hon. Sec.).

Tea-plant attacked by Fungus.—The fungus shown by Mr. McLachlan at a previous meeting proves to be *Poria xylostromatoides*, Berk.; an undetermined specimen in the Kew Herbarium, evidently the same species, is marked, "The Tea Stems, Cachar, India." The remedies suggested were the rubbing and scraping the stems, with the use of sulphur and lime.

Carnations attacked with Hylemyia Grubs.—Mr. McLachlan observed that the injury to Carnations

was brought to his notice last autumn. The grubs lived beneath the rosette of leaves forming the crown of the plant, and also bored into the stem below the crown. The perfect female insect, having been now obtained for the first time, it proves to be *Hylemyia nigrescens*, Rnd., allied to *H. Cardui*, which feeds in the flower-heads of Thistles. He suggests band-picking as soon as symptoms of flagging is seen in the Carnations. Mr. McLachlan's note upon this subject will be found in the *Entomologist Monthly Magazine* (sec. ser., vol. iii., p. 135). The committee will be glad if florists will observe when the Carnations appear to be first attacked, and record any observations they may make, in order to discover the best remedy in future.

Ground Ivy Gall.—Mr. McLachlan exhibited three large galls on this plant. They are due to *Aulax Glechomæ*, there being one gall-fly in each. He observed that it was an undecided point whether galls are the result of mechanical puncture, or due to some secretion by the insect, as different kinds of galls are sometimes produced by different broods of the same species—as the root-galls and "Oak-

of the British Vice-Consulate of Rochelle, respecting the ravages done by *Termea lucifugus*, a native of South Europe and North Africa. It was introduced about the end of the last century, and has now spread almost everywhere at La Rochelle. Many public and private institutions are in a dangerous state, as at the Prefecture the wooden beams have had to be replaced by iron. They have destroyed part of the archives, and it is found that it is useless to grow certain plants in the gardens (as *Geraniums*), as the ants consume the interior of the stalks. It has been found impossible to destroy or get rid of them. Dr. Müller remarked that they had proved very destructive to Vines in certain parts of France. Mr. McLachlan added that another species (*T. flavipes*), which had appeared and done much damage in Austria, has now been pretty well exterminated. Mr. Morris reminded the committee that the white ant had once been imported to Kew in a log of the Copal tree, and that when old slave ships were left at St. Helena, after liberating the slaves, the ants soon spread over that island.

then it would be completely decomposed, and the copper rendered insoluble. Dr. Müller added the important suggestion that the action of the copper solution might be highly injurious by destroying the nitrifying organisms. The general question, therefore, as to the possible injuriousness of sulphate of copper in the soil, becomes somewhat complicated. It was understood that experiments were about to be undertaken at Chiswick, where the above considerations would be attended to.

ROYAL OXFORDSHIRE HORTICULTURAL.

JUNE 21.—The annual Commemoration Flower Show took place in the gardens of Trinity College on the above date, and the weather being all that could be desired, it was attended by a very large company. The gardens comprise about 4 acres in extent, and one of the arboreal features is a Lime tree walk of forty-eight trees, twenty-four on either side; and these trees are supposed to be between 200 and 300 years old. Though so aged, very little development of trunk is made, as the trees are severely pollarded each year, to keep the heads within bounds. Formerly a line of Yews enclosed the Lime avenue on either side, but they have disappeared on one side entirely.

As is usual, the exhibits were arranged under two spacious tents. The vegetables, which were remarkably good for such a season, were placed on tables in the open, but under the shade of trees.

A few classes were open to all England, one for nine stove and greenhouse plants in flower, and Mr. James Cypher, nurseryman, Cheltenham, was placed 1st with very fine and fresh specimens, comprising *Bougainvillea glabra*, *Stephanotis floribunda*, *Allamanda grandiflora*, an excellent piece of *Dracophyllum gracile*, *Pimelea diosmæflora*, *Phænocoma prolifera* Barn.-sit, &c.; 2nd, Mr. J. F. Mould, nurseryman, Pewsey, whose leading plants were *Dipladenia amabilis*, *Clerodendron Thompsonæ*, *Statice profusa*, and *Franciscea calycina major*.

Another open class was for six Cape Heaths, and here Messrs. Cypher and Mould were severally 1st and 2nd, the former having strong plants of *Erica Massoni major*, *E. kingstoniensis*, *E. jubata*, and the following varieties of *E. ventricosa*, viz., *rosea*, *hirsuta alba*, and *Bothwelliana*. Mr. J. F. Mould also had some very good specimens, and it is pleasant to see these once popular exhibition greenhouse plants being shown in something like their old form.

Nine show *Pelargoniums* were also an open class, and Mr. C. Turner was awarded the 1st prize for this quantity of admirably-grown and bloomed plants we are accustomed to see from the Royal Nursery. Such varieties as *Sister of Mercy*, *Goldmine*, *Joe*, *Duke of Norfolk*, *Orient*, *Magpie*, *Outlaw*, and *Spotted Beauty*, were seen at their best. Mr. Turner also had a miscellaneous group of specimens, such as *Magnate*, *Emperor William*, *Martial*, *Amethyst*, one of the most distinctly purple of the show *Pelargoniums*; *Pluto*, *Francesa*, and several fancies.

In the classes open to all, were two for *Roses*, one for twenty-four triplets, and one for twenty-four single blooms; Messrs. J. Mattock and G. Prince, both well-known Oxford growers, took the prizes; the flowers were small, and consisted largely of Tea-scented varieties. Special prizes were offered by Miss Watson Taylor, for eighteen *Roses*, single blooms, and here Mr. G. Prince was 1st, and Mr. W. Narroway, 2nd.

Another class in this division was for a table florally decorated for dinner, six by four feet; and as three of these competed, they made a pretty feature placed crosswise in the middle of the cut flower tent. The best—decidedly the best, was set up by Mr. J. Mattock; the Rev. H. A. Pickard, Oxford, was 2nd; and Mrs. J. S. Parker, Oxford, 3rd.

A group of nine superb *Orchids*, staged by Mr. J. Cypher, was an object of considerable interest; they were of large size and finely bloomed, and consisted of *Cattleyas Mendelii*, *Sanderiana*, *Mossiae*, and *Warneri*, *Miltonia vexillaria*, *Oncidium macranthum*, *Dendrobium suavisimum*, *infundibulum*, and *thrysisiflorum*, and *Anguloa Clowesii*. In the class for four *Orchids* the only exhibitor was E. A. Beaves, Esq., Oxford, who had small but highly-creditable plants.

In the members division for six stove and greenhouse plants, Mr. Mould was 1st, and Mr. J. Mattock, 2nd. The best specimen stove plant was *Allamanda Hendersoni* from Mr. Mould; Miss Thomson, Stanton House, Oxford, with *Anthurium*

FIG. 5.—STRAWBERRY ROYAL SOVEREIGN. (SEE P. 19.)

apples" on the Oak. The latter surmise appears to be most probable.

Injury by Fog to Plants.—Professor F. Oliver has prepared and exhibited at the *soirée* of the Royal Society dried plants, as well as drawings, showing the injuries produced by London fog. Dr. Russell remarked, from some examinations he had made near the end of last year, that the amount of sulphuric acid in the fog was even greater than had been proved to exist in the air at Manchester.

Huskless Barley.—Dr. Bonavia exhibited specimens of three kinds—white, green, and dark purple-coloured varieties from India. They were grown in Oude by the Rajah as curious, but were not marketable produce. He also exhibited a small variety of Horse-bean called "Bakla," and specimens of the white "Gram," a variety of *Cicer arietinum*.

Megacarpæa polyandra (see fig. 4).—Mr. Burbridge sent a specimen of this remarkable Crucifer. It has twelve stamens instead of six, every one of the usual number being doubled. The fruit has two unequally-developed carpels, with a narrow dissepiment, somewhat resembling that of Penny Cress, being quite round and flat. It is a native of Western Thibet, W. Himalaya, Kumaon, at an altitude of 12,000 feet (*Fl. of Br. Ind.*, vol. i., p. 161).

White Ants in France.—Communications were received by Mr. Morris from R. S. Warburton, Esq.,

Potato Disease, and the Use of Sulphate of Copper.—

Some discussion arose on this subject relative to the statement that on certain occasions, and probably on different soils, it had proved to be less beneficial than expected; and that the question had been raised whether it did not render the soil injurious to plant life. Drs. Müller and Russell pointed out that the results might be very different if there were an excess of the copper-salt or of lime, as there might be not enough of lime to precipitate the former, resulting in an excess of copper-salt undecomposed in the soil. For example, Dr. Russell stated that he had taken the constituents of the mixture used by Messrs. Sutton, as stated in the *Times*, and found that the lime was not sufficient to decompose all the sulphate of copper, so that some of the solution had probably entered the soil. Secondly, the quality of the lime was an important point, as there might be an excess of caustic lime, which would probably be equally injurious. Moreover, the results might vary considerably according as the soil was naturally calcareous or purely siliceous. In the latter case a deficiency of basic materials would very likely bring about an excess of copper sulphate as a residue. Thus, Dr. Russell observed, that the solution on entering the soil would not at first be decomposed, but if lime or other bases, as magnesia, were present,

Scherzerianum. The best specimen greenhouse plant was a fine *Erica Kingstoniensis* from Mr. Mould; Mr. Mattocks was 2nd with an *Azalea*.

Chief among the flowering plants were the zonal Pelargoniums. In the class for six plants, Mr. J. Johnson, florist, Garsington, Oxford, was placed 1st, with grandly-grown and flowered plants, some of the best seen for some time, the varieties being John Bright, Robert Hayes, Hyacinth, Zelia, Eurydice, and Dr. Orton. Mr. J. Walker, nurseryman, Thame, came 2nd, with an excellent lot of plants also.

Pelargoniums of the show type, double zonals (very fine indeed), Ivy-leaved, and variegated-leaved, were all very good.

Fuchsias were represented by well-grown plants, but wanting a few more days to be in perfect bloom. Achimenes and Gloxinias were well represented.

Foliage plants, generally represented by excellent Palms, exotic and hardy Ferns, *Coleus*, &c., were all well shown by various exhibitors.

In the cut-flower classes, *Roses*, bunches of hardy flowers, *Ranunculus*—and Oxford seems to be still a centre for the culture of some of the choicer varieties—*Pansies*, *Pyrethrums*, and *Iris* were shown.

Fruit.—The show of fruit was a fairly good one for the season. The best three bunches of white Grapes were well-finished Foster's Seedling, from Mr. Broadfoot, gr. to Col. Miller, Shotover; Mr. Robins, gr. to Col. Lee, Aylesbury, was 2nd, with the same. Mr. Robins had the best three bunches of Black Hamburgh Grape, of good colour; and Mr. Doherty, gr. to Lord North, Banbury, was 2nd. Mr. Robins had the best Peaches, in Dymond; Mr. Broadfoot coming 2nd with *Grosse Mignonne*. The best Nectarines were Lord Napier. Mr. Robins, and Mr. Neal, gr. to R. Southby, Esq., Bampton, were 1st and 2nd. The best Strawberries were President and Sir J. Paxton. Cherries were also well shown.

Vegetables.—The leading classes for vegetables were those in which special prizes were offered by Messrs. Sutton & Sons, Reading, and Messrs. E. Webb & Sons, Stourbridge. Here Mr. T. Lockie, gr., Oakley Court, Windsor, was 1st in both classes, staging vegetables of remarkably fine quality in such a late season. Mr. G. Neal took the 2nd prize given by Messrs. Sutton & Sons, with a very good collection indeed, and Mr. Brock (gr. to C. D. Batt, Esq.), Witney, that of Messrs. Webb & Sons. Cucumbers were numerous, Mr. Lockie taking the 1st prize with a brace of perfect fruits of Lockie's Perfection. Of Kidney Potatoes the best was Guardian, one of the Bedford seedlings, early, and very handsome; the best Round, also early and very fine. Sutton's Seedling excellent early forcing Horn Carrots were shown; the purple top Munich Turnips were admirable; the best Peas were Sutton's Early Marrow, a large-podded early variety of the finest quality; William Hurst and Exonian, both of very fine quality; and William I. It was too early for some other vegetables in such a retarding season.

From Blenheim Palace Gardens, Mr. Whillans brought a very fine collection of bluish and pink Malmaison Carnations: the crimson Madame A. Warocque, Mrs. Moore, a large white self; Germaine, and Improved Miss Jolliffe. It well deserved the highest special award which could be made.

RICHMOND HORTICULTURAL.

JUNE 29.—It was not a matter for surprise that the executive of this Society should have, the morning of their annual summer show, held on the above date, much misgiving. The previous night had brought one of the worst thunderstorms known for many years, that threatened a catastrophe rather than a success for the show. Happily the tents stood fast, and although the wind was somewhat wild and cold at times, and the sky overcast and gloomy, yet all went well eventually, and there was seen by the visitors one of the most gay and beautiful shows yet held by the Society. The site was this year shifted from the old deer park to the athletic grounds nearer the Kew Road—an admirable place, but lacking the fine trees of the old site, the shade of which was not, however, this year required. The show was held in four large tents, two for plants, one for cut flowers, and one for fruit and vegetables. During the afternoon the Duke and Duchess of Teck visited the show, and the huge band from Kneller Hall supplied the music.

Groups.—In the plant-tents very striking features were the fine mixed groups of flowering and foliage plants shown by various nurserymen. Messrs. J. Veitch & Sons, Chelsea, had a superb group of pot

Roses, fronted by a margin of *Eurya latifolia* variegata, and backed by some fine clumps of *Spiraea astilboides*, *Bumalda variegata*, and those lovely white-flowered shrubs, *Philadelphus microphyllus* and *Andromeda speciosa cassinifolia*, the latter carrying long spikes of thick white cup-shaped flowers.

Messrs. B. S. Williams & Co., Holloway, had a good group of flowering and foliage plants, a good specimen of *Allamanda Williamsii* forming a striking central object. Messrs. J. Peed & Sons, Norwood, had a bright effective group. Messrs. J. Laing & Sons, Forest Hill, showed a group, which included good Begonias, Gloxinias, a fine piece of *Cattleya gigas*, *Caladiums*, and numerous other foliage and flowering plants.

Mr. W. Iceton, Putney, had a very large central group of giant Palms, with white Lillies, Hydrangeas, &c. A remarkably beautiful as well as meritorious collection of Begonias, Gloxinias, &c., was staged by Messrs. Sutton & Sons, Reading. This included large plants of the pure white Gloxinia Her Majesty, also Duke of York, brilliant vermilion, broadly edged pure white, very fine; and their new reticulated strain, large erect flowers of blue, purple, scarlet, and red grounds, heavily splashed and spotted white, very novel and beautiful; also Begonias of the hybrid Princess Beatrice strain, so capital for bedding, pot-work, or winter blooming; Crimson King, 10 inches high, full of flowers, bright coral-red in colour; and Duchess of Edinburgh, white, edged rosy-red; also a fine new Achimenes, Rosy Queen, large-flowered, in colour rosy-pink, strong grower, and very pleasing.

Cut Flowers.—The trade showed largely, Messrs. Collins & Gabriel, Hampton, having a very large and an effective group; as also had Messrs. Barr & Sons, Covent Garden, Messrs. Cutbush & Sons, Highgate, and others. All these collections were most attractive features.

Orchids.—Mr. H. Little, Twickenham, sent a good collection of *Cattleyas*, *Laelias*, *Cypripediums*, &c.; and Mr. H. Tracey, of the same place, had some capital *Cattleyas*, &c. Of plants in competition, the best half dozen came from Mr. Young (gr. to F. Wigan, Esq.), East Sheen, who had *Miltonia vexillaria*, *Epidendrum vitellinum*, *Aerides Fieldingii*, *Grammatophyllum Seegerianum*, and *Cypripedium Veitchianum* and *Lawrencianum*. The next best lot came from Mr. Ryder (gr. to C. Young, Esq.), Richmond, who had good *Cattleyas gigas* var. *Sandersoniana*, and *Mossiae*, *Oncidium Marshallianum*, *Miltonia vexillaria*, *Odontoglossum Alexandre*, and *Cypripedium barbatum*; Mr. H. James, Lower Norwood, was 3rd.

Stove and Greenhouse Plants.—The best six flowering plants came from Mr. F. Mould, Pewsey, Wilts, who had a fine fresh *Clerodendron Balfouriana*, a huge *Phenacoma Barnesii*, good *Franciscia calycina* major, and *Ericas ventricosa*, *Bothwelliana*, *Parmenteriana rosea*, and *retorta* major; Mr. H. James was 2nd, and Mr. Currey, Salisbury, 3rd. Mr. Mould also set up a large group of specimen plants.

The best single specimen was a fine *Statice profusa*, from General Annesley, Otlands Park (the gardeners' names were frequently omitted from the cards); the second best being a large *Anthurium Scherzerianum*, sent by Mr. Parsons, gr. to T. Twining, Esq., Twickenham.

The best specimen fine foliage plants were good *Cycas revoluta*, and a huge *Eurya latifolia* variegata. Ordinary fine-foliage plants were not exceptionally good.

Palms were in abundance, the finest half dozen coming from Mr. Simmons, gr. to W. Cunard, Esq., Orleans House, Twickenham. Mr. Wilkes, gr. to T. Cane, Esq., Richmond, had the best six exotic Ferns, fair samples; and Mr. Young, gr. to Mr. F. Wigan, the best six, all very good specimens. Hardy Ferns were very good. Mr. Sallows, gr. to Miss Vaughan, Twickenham, had six capital *Coleuses*, well-coloured.

Decorative Groups were specially good, but the large ones only call for notice. The winner of the 1st prize this time was Mr. H. E. Fordham, Twickenham, who had a light and very beautiful arrangement; Mr. A. Brown, Richmond, was 2nd with one not less beautiful, but wanting rather in bloom. A fine group of show and fancy Pelargoniums came from Mr. C. Turner, of Slough, and a smaller one from Mr. Baldwin, Hillingdon, with six show plants in superb bloom, *Mandarin*, *Magnate*, *Goldmine*, *Cygnat*, *Symmetry*, and *Joe*. Mr. Turner was an easy 1st, Mr. Baldwin coming 2nd. Mr. Turner was also 1st with beautiful specimen fancies, having The Shah, Ambassador, Princess Teck, Delicatum, Mrs. Hart, and Mr. Thornton.

Mr. Henry Little had the best six zonal Pelargoniums, all in fine bloom; and also the best six Ivy-leaf varieties, being very closely run by the more columnar plants of Mr. W. Furze, Teddington.

The best twelve Begonias came from Mr. White (gr. to Mrs. Farnell Watson, Isleworth); another very good lot coming from Mr. Portbury, gr. to W. Froy, Esq., Putney.

Gloxinias in three classes made a very fine show, the best nine plants coming from Mr. Nunn, gr. to P. Rankin, Esq., East Sheen, who set up some of the very best grown and flowered plants we have seen. In another class for nine, Mr. Meaden, gr. to J. B. Hilditch, Esq., Richmond, had the best plants. Fuchsias were poor. It is, however, impossible to notice one half of the numerous exhibits in the plant classes.

Roses.—The Rose show was one of unusual extent, the open classes having been extended to increase the display. It is very noticeable how often the Colchester growers do well at Richmond, and this time they practically carried all before them.

In the class for thirty-six trebles, Mr. B. Cant was 1st, having, of dark flowers, A. K. Williams, *Gustave Piganeau*, new and fine *Madame Ducher*, Duke of Edinburgh, Alfred Colomb, Maurice Bernardin, Le Havre, &c.; of light hues, The Bride, Catherine Mermet, *Violette Bowyer*, Lady Mary Fitzwilliam, *Souvenir d'Elise*, *Madame de Watteville*, and *Innocente Pirola*. Of intermediate hues there were *Marie Contet*, La France, *Marie Finger*, *Lucide* (Tea, a beautiful colour), Mrs. John Laing, *Madame Gabriel Luizet*, &c. Messrs. Paul & Sons, Cheshunt, was 2nd, having new *Gustave Piganeau*, and *Madame Issac Pierre*, rosy pink.

With twenty-four trebles, Mr. F. Cant was 1st, having the striped *Pride of Reigate*, *Caroline Custer*, *Jeannie Dickson*, *Marie van Houtte*, &c., good. Mr. B. M. Cant was 2nd.

Messrs. Cant took the prizes in the class for twelve trebles.

With twelve blooms, one variety, Messrs. Perkins, Coventry, was 1st, with fine *Lady Mary Fitzwilliam*; Mr. C. Turner coming 2nd with *Madame Gabriel Luizet*.

Messrs. Paul & Son had the best twelve Teas with *Madame de Watteville*, The Bride, and *Maréchal Niel*; Mr. F. Cant and Mr. B. Cant coming 2nd and 3rd respectively.

The best twenty-four (amateurs) *Roses* came from Mr. Warwick, gr. to J. P. Kitchen, Esq., Hampton; Mr. R. E. West, Reigate, coming 2nd. Mr. Hugh White, Highbury, had the best twelve blooms. Messrs. Jackman & Sons, Woking; Messrs. Rumsey, Waltham Cross; and Mr. Will Tayler, Hampton, showed good collections of flowers.

In the Rose tent were table decorations, baskets, bouquets, &c., in great variety. Mr. G. Wythes, Syon House gardens, showed a box of beautiful cut Orchids. Mr. G. Sage was placed 1st for a box of cut flowers, in bunches; and Mr. Gardiner, of the Police Orphanage, had 1st prize for twelve bunches of hardy flowers. In a large class for these, Messrs. Barr & Sons, Mr. Hodges, Chiselhurst, and Mr. Sage respectively took prizes. The table decorations, baskets, &c., were of a very beautiful order, and too numerous to mention further.

Fruit.—This was fairly good, the best collection of six dishes coming from Mr. Osman, gr. to J. L. Baker, Esq., Chertsey, who had good Black Hamburgh and Buckland Sweetwater Grapes, Masterpiece Melon, *Grosse Mignonne* Peaches, Brown Turkey Figs, and Elruge Nectarines. Mr. Waite, gr. to Col. Talbot, Esher, was the only other exhibitor.

The best black Grapes, fine Hamburghs, came from Mr. Ford, gr. to W. H. Ellis, Esq., Hounslow; Mr. Osman coming 2nd; but was 1st with capital Bucklands in the class for whites; Mr. Ford being 2nd with Foster's Seedling.

In the local classes, Mr. Sage had the best Hamburgh for black, and also with good Buckland Sweetwater for white. Mr. Sage was also 1st with four dishes of fruit. Mr. Burton, gr. to J. D. Paul, Esq., Twickenham, had the best nine Peaches in Bellegarde, and Mr. Simmonds the best nine Nectarines in Lord Napier. Mr. Sage was 1st with two dishes of Strawberries, capital President and Dr. Hogg. Superb Perfection Tomatoes were placed 1st for Mr. Wagstaff, St. Margarets; Mr. Sage having the 2nd best.

Vegetables.—These were in great quantity, but we can only notice the large collection of twelve dishes shown by Mr. Waite for Messrs. James Carter & Co.'s prizes, which were exceptionally fine; and the same exhibitor's nine dishes in another class. These

comprised fine Cabbages, Sutton's Seedling Potatoes, Duke of Albany Peas, Gem Carrots, Leviathan Beans, Perfection Tomatoes, King of the Cauliflowers, Lisbon Onions, &c. Mr. Waite, for prizes offered by Messrs. Sutton & Sons, had the best fifty Peas in Duke of Albany; and Sir Edwin Saunders, Wimbledon, the best brace of Cucumbers; and in another Cucumber class, Mr. Stroud, Twickenham, had the best brace.

FLORESTA'S FLOWERS.

CINERARIAS.

The improvement effected in Cinerarias within the last twenty years or so has been very great, and instead of small poor flowers, we have blossoms large and well-rounded, close, and of great substance, with well-defined colours, inasmuch, that the plants when well grown make a magnificent show; and especially is this the case with the French strains, which have blooms ranging from 2 to 3 inches across. The habit of these, however, is not equal to the English, which are dwarf and compact, and send up fine heads of flower. Seed of good varieties can be obtained from any of the large nurserymen, and the present is a good time to sow, if plants are not wanted very early, in which case they should have been raised sooner.

A good method is to prepare a pan by draining, and covering the bottom with rough soil, and then fill up with a light compost which has been finely sifted, when the whole should be pressed down quite firm, and made perfectly smooth on the top, after which a gentle watering should be given, and in an hour or so after the seed may be sown. This should be done by scattering the seed regularly and thinly, and all the covering that ought to be used is a sprinkling of silver-sand, or soil shaken through a gauze-wire sieve; and if a sheet of glass is then laid over the pan, and covered with a sheet of tissue, and the pan placed in a close warm pit, the seed will quickly germinate. As soon as this has come about, the glass must be taken off, or the tiny plants will be drawn and injured. To keep them growing freely, they should be lightly syringed daily, and directly they are large enough to handle, prick them off; this can be done in pans or boxes, or the plants may be potted singly in small pots—the first-mentioned being the better plan, and the potting carried out later on. Two-thirds loam to one of leaf-mould, with just a dash of sand to keep the whole open, will be found a suitable compost. In this the plants should be potted as soon as they get into rough leaf, using 3-inch pots, which should then be stood in a frame where they can be kept close and moist, which will help them to start.

As Cinerarias are naturally shade-loving plants, the frame should be stood under a north wall, or other situation where the sun shines on it for a short time only, which is better than shading the glass, as the plants get sufficient light. As a floor to stand them on, there is nothing equal to sifted coal-ashes, as it remains always moist and cool, and the dampness keeps the plants healthy, and free from red-spider, to which Cinerarias are liable under less favourable conditions. The treatment requisite during the summer is to water carefully, and sprinkle the plants overhead every afternoon, and when that is done the lights should be closed till the morning. As soon as the pots become full of roots the plants should be re-potted, as any check to growth will now throw them prematurely into bloom, which will prevent them increasing the size and strength of their crowns. Although most plants do best with firm potting, Cinerarias are an exception, and thrive most when the soil is somewhat loose and friable. The size of pots most suitable are 4 1/2's and 3 1/2's, and when the roots have filled them, liquid-manure should be afforded once or twice a week till they come into bloom. Clear soot-water is as good as anything as a manure, it being an excellent stimulant, having a good effect on the colour of the foliage, if not applied too strong or too often. As Cinerarias are very susceptible to

injury by frost, great care must be taken in the autumn, if in cold frames, to protect them, and it is better practice to remove them to a light pit or house where they can be kept safe, at the same time guarding against any unnecessary forcing. A temperature of 40° to 50° they are sure to do well in, if mildew and insects are not allowed to attack them. The best remedy for mildew is sulphur dusted on the foliage, and aphids may be readily disposed of by fumigating with Nicotine. It often happens that in growing Cinerarias that some show exceptionally fine flowers of good qualities, and these should be set aside for seed or for affording offsets; such plants, after flowering, should be stood in some cold pit or frame, and encouraged to make side shoots, which may be taken off, with some roots attached, and grown and treated precisely the same as the seedlings. If the intention is to save the seed, then the plants should be stood up near the glass on a shelf, or other light position, where they can get plenty of air and be free from damp, that the pollen may ripen. J. S.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending June 25, is furnished from the Meteorological Office:—

"The weather during this week was somewhat cloudy or dull generally, with frequent and rather heavy falls of rain, but there were several very bright intervals. Thunder and lightning occurred at times in different parts of the Kingdom.

"The temperature was again below the mean, the deficit ranging from 1° in Ireland, and 2° in most of the other western districts, to 5° in 'England, S.,' 6° in 'England, N.E.,' and 7° in 'England, E.' The highest of the maxima, which were registered on rather irregular dates, ranged from 72° over the greater part of England, to 66° in 'Scotland, W.' and the 'Channel Islands.' The lowest of the minima were recorded during the earlier part of the period in 'England and Ireland,' but on irregular dates in Scotland; they ranged from 32° in

'Scotland, E.,' to 40° in 'England, N.E., S., and N.W.,' to 46° in the 'Channel Islands.'

"The rainfall exceeded the mean in nearly all districts, but was less in 'Scotland, N.,' 'England, S.W.,' and 'Ireland, N.' In the eastern and southern parts of England the excess was rather large.

"The bright sunshine was less prevalent over the Kingdom as a whole, than for some weeks past, and was less than the mean in nearly all districts. The percentage of the possible duration ranged from 24 in 'England, N.E.,' and 25 in 'Scotland, E.,' to 37 in 'England, N.W., and S.W.,' and to 40 in the 'Channel Islands.'

MARKETS.

COVENT GARDEN, June 30.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

SUPPLIES still keep heavy, but goods cleared at lower prices. James Webber, Wholesale Apple Market.

POTATOS.

NEW POTATOS.—Kidneys, 7s. to 8s.; Rounds, 6s. to 6s. 6d. Market dull.

OLD POTATOS.—Season virtually over. Best samples command 100s. to 120s. per ton. J. B. Thomas.

SEEDS.

LONDON: June 29.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market presented no new or striking feature. The new French Trifolium shows excellent quality; prices promise to be moderate. White Mustard is dearer. Rape-seed keeps firm. In Canary seed there has been a substantial advance; sales of Turkish are reported in Liverpool at 49s. per quarter. Hemp and Linseed are low. There is no

change in either Peas or Haricots. Buckwheat, Dari, and Millet are without alteration. For Tares there is still a small inquiry.

FRUITS AND VEGETABLES.

SPITALFIELDS, June 28.—Quotations:—New Zealand Apples, 5s. to 8s.; foreign Tomatoes, 1s. to 1s. 6d. per box; forced Rhubarb, 1s. to 1s. 6d.; natural do., 1s. to 2s. per dozen bundles; Black Cherries, 5s. 6d. to 7s. 6d. per half-sieve; Strawberries, 2s. to 3s. 6d. per peck; Seakale, 1s. to 1s. 3d. per punnet; Cabbages, 3s. 6d. to 7s. per tally; Greens, 2s. to 2s. 6d.; Turnips, 2s. to 2s. 6d.; Spring Onions, 3s. to 4s. 6d.; Parsley, 1s. to 1s. 6d. per dozen bunches; Spinach, 1s. to 1s. 6d. per bushel; Cauliflowers, 2s. to 3s.; Endive, 6d. to 1s.; Cabbage Lettuce, 4d. to 1s.; Leeks, 2s. to 2s. 6d.; frame Cucumbers, 1s. 6d. to 2s. 6d.; natural do., 1s. to 1s. 6d.; Beetroots, 6d. to 8d. per dozen; Peas, 8s. to 10s. per sack; Cos Lettuce, 6d. to 1s. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Horseradish, 1s. to 1s. 2d. per bundle; Mint, 1s. 6d. to 2s. per dozen bundles.

BOROUGH, June 28.—Quotations:—Cauliflowers, 2s. 6d. to 4s. per dozen; Cabbages, 4s. to 7s. per tally; Peas, 3s. to 5s.; Spinach, 1s. 3d. to 2s. 6d. per bushel; Greens, 2s.; Carrots, new, 6s. 6d. to 9s.; Spring Onions, 6s. to 8s. per dozen bunches; Egyptian do., 4s. to 5s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s. per barrel.

FARRINGTON, June 30.—Quotations:—Peas, 8s. to 9s. per sack; Spinach, 1s. 3d. to 1s. 6d. per bushel; Cabbages, 4s. to 5s. per tally; Cauliflowers, 2s. per dozen; Onions, Egyptian, 5s. to 5s. 6d. per bag of 110 lb. Fruit (foreign): Tomatoes, 1s. 3d. per box of 7 lb.; Cherries, 1s. 3d. to 1s. 6d. per box of 16 lb.; Tasmanian Apples, 6s. 6d. per box of 46 lb.; Black Currants, 3d. per lb.

STRATFORD, June 28.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Cabbages, 4s. to 7s. per tally; Greens, 2s. to 3s. per bag; Turnips, 4s. to 4s. 6d. per dozen bundles; Carrots, household, 3s. 6d. to 4s. per dozen; Mangolds, 15s. to 20s. per ton; Onions, Egyptian, 80s. to 110s. per ton; Green Peas, 4s. to 5s. per sieve; do., 9s. to 12s. per bag; Cucumbers, 2s. to 3s. 6d. per dozen.

POTATOS.

BOROUGH, June 28.—Quotations:—New: Jersey, 6s. 6d. to 8s.; Cherbourg, 6s. to 7s. per cwt. Old:—Bruce Magnums, 80s. to 110s.; Fenland do., 70s. to 75s. per ton.

SPITALFIELDS, June 28.—Quotations:—New: Jersey Rounds, 6s. to 6s. 6d.; do. Kidneys, 6s. 6d. to 7s.; do. Flukes, 6s. 6d. to 7s. 6d.; Cherbourg Rounds, 5s. 6d. to 6s.; do. Kidneys, 6s. 3d. to 7s.; do. Flukes, 6s. 6d. to 7s. 6d.; St. Malo Rounds, 6s. to 6s. 3d.; do. Kidneys, 6s. 6d. to 7s. (d.); Lisbon Rounds, 6s. 6d. to 7s. per cwt. Old:—Magnums, 65s. to 75s. per ton.

STRATFORD, June 28.—Quotations:—Old: Magnums, 80s. to 100s. per ton. New:—Jersey, 7s. to 8s.; Cherbourg, 6s. to 7s. 6d.; St. Malo, 6s. to 7s. 6d.; Canary, 7s. 6d. to 8s. 6d. per cwt.

FARRINGTON, June 30.—Quotations:—New:—Jersey Flukes, 8s. to 8s. 6d.; Kidneys, 7s. to 8s.; Rounds, 7s. per cwt. Old:—Scotch Magnums, 100s. to 125s.; Bedfords, 90s. to 100s.; Lincoln, 90s. to 100s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending June 25, and for the corresponding period last year:—1892: Wheat, 29s. 6d.; Barley, 23s. 4d.; Oats, 21s. 10d. 1891: Wheat, 39s.; Barley, 28s. 3d.; Oats, 21s.

NOTICES TO CORRESPONDENTS.

**** PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.**—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilize them for the benefit of our readers.

A TEMPORARY HOME: A Gardener's Daughter. The Servants' Home, 1, Sydney Street, Fulham Road, London, S.W.

ACER CAMPESTRE: A. The leaves are attacked by a mite, *Volvulifex aceria*.

BEGONIA BAUMANNII: C. Erichsen. We cannot say where the plant may be purchased. We do not observe that it is quoted in any of our best lists.

BRUCCOLI, METHVEN'S JUNE: T. M. & Sons. Solid well protected white curd; flavour mild; valuable for late use. Should be sown in the beginning of the month of May so as to be sure of coming in late. It would then overlap the Cauliflower season.

CELOGYNE CRISTATA: G. B. D. Your plants should have been repotted last March, soon after the flowers had disappeared, and we should now be

inclined to leave them until that time next year, as by this date the growths are in full activity, and little or no benefit would be derived from a shift during this season. You could, however, water them occasionally with much diluted liquid manure, taking great care not to allow any to touch the foliage. Baskets, or pans, are most suitable for this plant, and they should be well drained. The soil should be composed of peat and sphagnum moss, equal parts, to which add a little silver sand. Keep the plants an inch or so above the rim of the pan, and press the soil firmly about them. The temperature during the growing season should be about 60° to 65°, but after this is completed, they may be kept slightly cooler. Give plenty of water during the growing season, but be very careful that none is allowed to lodge in the centre of the young growths. After growth is matured, all the water necessary is to keep the pseudobulbs from shrivelling.

ELMS DYING OFF: T. R. B. It will sometimes happen that trees get planted over some unsuspected foundations of old buildings, and in consequence of the thinness of the soil, they become starved to death, a process accelerated by the absence of manuring, even the fallen leaves being either blown away or swept up. An examination of the soil under the roots should be made, and if it then be found that our surmise is the correct one, the trees' lives might be prolonged by the addition of rich soil and mulchings of manure, annually applied.

EUCHARIS SEEDLING: G. C. The flowers differ in certain features from all those hitherto figured.

FIG LEAVES WITH BROWN SPOTS: E. Smith. Neither fungus nor insects. They are probably due to a moist unduly heated atmosphere.

GARDEN LABOUR: A Perplexed Gardener. There are many other items of information concerning the garden which you have not mentioned, which would assist us in forming a just opinion of the number of workpeople required; but even with the kind of information you furnish before us, you seem to be under-manned. Twelve men and two boys would be nearer the mark than ten men and two boys.

LILIO-CATTLEYA × PÆDÆ (C. Mossiae ♀ Lilia cinnabarina ♂), Gardeners' Chronicle, June 18, p. 790. By an error in the note accompanying the illustration of this pretty Orchid, *L. purpurata* was named as one of the parents, instead of *L. cinnabarina*.

NAMES OF PLANTS: Messrs. Stewart & Co. *Hordeum jubatum*.—*A. R. Z. 1* (next week); *2, Funkia cordifolia*; *3, Tradescantia virginica*; *4, Geranium pratense*; *5, Lyimachia vulgaris*; *6, Hippophae rhamnoides*.—*C. M. P. Helianthemum vulgare*.—*Dickson's, Belfast, Papaver nudicaule var. pyrenaica*.—*Clibran, Thalictrum tuberosum*.—*A. C. Cattleya Warszewiczii*, commonly called *C. gigas*.—*W. D. Cattleya Mossiae*, a fairly good variety.—*S. Kintore, 1, Selaginella caulecens*; *2, S. caesia*; *3, Melittis melisophyllum*; *4, Anthericum liliastrum major*.—*P. S. 1, Jasminum revolutum*; *2, Rheum palmatum, var. tanghutum*; *3, Agatheae coelestis*; *4, Gaultheria Shallon*; *5, Thunbergia Harriet*; *6, Diplacna glutinosa*; *7, Lantana variety*.—*F. Clarke, Rosa arvensis*.—*T. C. Send better specimens*.—*C. H. Baptisia exaltata*.—*H. G. Peristeria aspersa*.—*A. P. Poa pratensis*.—*W. F. B. Salvia carduacea*.—*J. Tunnington, Aristolochia elegans*, a warmhouse species, see *Gardeners' Chronicle* for figure, p. 301, vol. xxiv., 1885.—*Correspondent, 1, Meospidium sanguineum*; *2, Brassia verrucosa*; *3, Sequoia sempervirens, Redwood*; *4 and 5, dwarf forms of the common Spruce, Picea excelsa*.—*W. C. Your plant is the Pyrenean variety of P. nudicaule*.

NEW STRAWBERRY: R. G. Fine in size, and of good colour, but in flavour it is not so good as some others.

PERFORATED LEAVES: H. H. D. The leaves have the appearance of having suffered from hail. We know of no caterpillar or insect which would make such neat round holes in a leaf.

PLANTAGO LANCEOLATA: A. Branching of the inflorescence.

in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for
giving publicity to announcements of this class. It is the
leading Agricultural Paper in the County, and Circulates
most extensively among Agriculturists in and around
Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let
would do well to advertise in the "WORCESTER HERALD,"
the Leading County Paper. Specially adapted for bringing
such notices before Tenant Farmers. Large circulation.
Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is
recognised as a specially good medium. Cheap Rates.

MAN. Wages, 17s. per week, with bothy and vegeta-
bles. Applying, stating age and experience, to HODGSON,
Kirklees Park Gardens, Brighouse, Yorks.

WANTED, a MAN, thoroughly experienced
in the Growing and Forcing of Grapes (chiefly
Muscats); also Roses (cut blooms) for Market. Good salary
and encouragement given.—Write full details to D. C. H.,
Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, a good INDOOR MAN.—State
wages required and full particulars.—H. ENGLISH,
Clapton Nursery, near Clevedon.

WANTED, a young MAN, for a Market
Nursery, where Tomatoes and Cucumbers, Chrysanthem-
ums and Redding Stuff are chiefly grown; must be well up
in Cucumber and Tomato Growing. Also, a strong YOUTH,
about 18, accustomed to Watering, Potting, and Tying, to
assist above. Good wages; permanent situation.—JAMES
HODGES, Springfield Nursery, King's Heath, Birmingham.

ORCHIDS: JOURNEYMAN.—WANTED,
a young MAN, having a good knowledge of Orchids, for
the Orchid-houses.—Apply, with particulars, to Mr. WARD,
Longford Castle, Salisbury.

WANTED, a respectable MAN, to keep
Lawns, &c., in order. Wages 16s. per week. One
room unfurnished.—Mrs. KEMBALL COOK, Stanmore Park,
Stanmore.

WANTED, TWO young MEN, for Kitchen
Garden and usual Outside Work. Wages, 15s. per
week, with bothy.—Apply, HEAD GARDENER, Marden Park,
Caterham Valley, Surrey.

WANTED, for a Nursery Office, a JUNIOR
CLERK. Must write a good hand, have a competent
knowledge of Book-keeping, and must be well recommended.
One who knows the names of plants preferred. Small salary
to begin with.—Particulars to JOHN STANDISH AND CO.,
Royal Nurseries, Ascot, Berks.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the
year is so great, we are compelled to state
that advertisements received after 6 P.M. on
Wednesday will, in all probability, be held
over to the next week.

Advertisers are cautioned against having letters
addressed to initials at Post-offices, as all
letters so addressed are opened by the
authorities and returned to the sender.

Head Gardeners.

JOHN LAING AND SONS can at present
recommend with every confidence several energetic
and practical Men of tested ability and first-rate character.

and HEAD GARDENERS for first-rate Establishments or
Single-handed Situations, can be suited and have full par-
ticulars by applying at Stanstead Park Nurseries, Forest Hill,
London, S.E.

SANDERS, St. Albans, can thoroughly
RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are
always in a position to RECOMMEND MEN of the
highest respectability, and thoroughly practical at their busi-
ness. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO.

beg to announce that they are constantly receiving
applications from Gardeners seeking situations, and that
they will be able to supply any Lady or Gentleman with
particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.—I have at present
several very superior MEN on my Register, whose char-
acter and ability will bear the strictest investigation.—
JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh.

£10 BONUS will be paid by Advertiser to
anyone giving him information of Gardening
changes that will lead to his appointment as HEAD
GARDENER where not less than eight or ten men are kept.
Highest references.—T. L. T., *Gardeners' Chronicle* Office,
41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—MR. CLARKE, Head
Gardener to the Earl of Lonsdale, Lowther Castle,
Penrith, can with every confidence recommend his Foreman to
any Lady or Gentleman requiring the services of a thorough
practical man, experienced in all branches.

GARDENER (HEAD), where one or more are
kept, or FOREMAN in the Houses.—Age 27; experi-
enced in all branches. Good character.—H., 34, Croham
Road, Croydon.

GARDENER (HEAD).—Age 38; married; a thorough practical knowledge of all branches. Seven years in present situation. Leaving through death and break-up. The highest references for character, &c.—C. W., 15, Furze-field Road, Blackheath, S.E.

GARDENER (HEAD WORKING).—Scotchman; age 36, married; thorough practical all-round man; eighteen years' experience; eight years in present situation; leaving through no fault; highly recommended.—**HEAD GARDENER**, Spring Grove, Bewdley.

GARDENER (HEAD WORKING).—Age 30, married; fifteen years' good experience of Grapes, Peaches, Melons, Stove and Greenhouse Plants, Flowers, and Vegetables. Is an abstainer.—**W. GRANTHAM**, Dummer, Basingstoke.

GARDENER (HEAD WORKING).—Age 44, married. Over twenty years' practical experience; thoroughly understands Grapes, Peaches, Flower and Kitchen Garden. Seven years' good character; abstainer.—**B. L.**, 43, Albany Road, Ealing Dean.

GARDENER (HEAD WORKING).—A LADY wishes to recommend a thoroughly practical all-round Gardener who lived fifteen years in the family; only left owing to establishment being broken up through a death.—**W. BROWN**, 1, Stockwell Street, Cambridge.

GARDENER (HEAD WORKING), age 46, married, no family, abstainer, requires re-engagement where others are kept.—Life practical experience in Growing and Forcing all kinds of Fruits, Stove and Greenhouse Plants, Vegetables, and Mushrooms; also Kitchen and Flower Gardens, and Pleasure Grounds. Eight years' excellent character from last employer, and good references.—**J. D.**, Myrtle Cottage, Wick Road, Hampton Wick, Middlesex.

GARDENER (HEAD WORKING).—Age 38. Thoroughly experienced in all branches; wife and landress. Can be highly recommended by present employer, **SIR ALEX. WILSON**. Two in family.—**GARDENER**, Eastwood, Sydenham.

GARDENER (HEAD WORKING).—Age 25; ten years' good practical experience in the Cultivation of Grapes, Peaches, Melons, &c.; Stove and Greenhouse Plants, Flowers and Vegetables. First-class references. Total abstainer.—**A. COLE**, Hextable, Swanley, Kent.

GARDENER (HEAD WORKING).—Age 30, married; thoroughly understands Grapes, Peaches, Melons, Cucumbers, and Flower and Kitchen Garden; good character and references.—**P. FIELD**, 4, Upton Villas, Bexley Heath, Kent.

GARDENER (HEAD WORKING), experienced and reliable.—A GENTLEMAN wishes to recommend the above, who has been nine years with a relative, now living abroad. He left solely on account of the place being sold.—**APSEY SMITH**, Esq., Fairlawn, Reading.

GARDENER (HEAD WORKING), where two are kept; age 27.—**J. ANDERSON**, Gardener, Charman Dean, Worthing, wishes to recommend his Foreman, **J. SKINNER**, to any Lady or Gentleman requiring a good practical man. Twelve years' experience.

GARDENER (HEAD WORKING), or FOREMAN, where several are kept.—Age 31, married; a thorough Plant and Fruit Orower, including Pines, Peaches, Vines, Melons, Orchids, Stove and Greenhouse Plants.—**T. A.**, West Park Lodge, Mortlake, Surrey.

GARDENER (HEAD WORKING).—Age 32, married, no family; eighteen years' good practical experience in all branches. Good testimonials. Two South Kensington certificates.—**H. LAURENCE**, Albert Terrace, High Street, Saldown.

GARDENER (HEAD, OF GOOD SINGLE-HANDED).—Age 35, married.—A GENTLEMAN wishes to recommend his Gardener as above; thoroughly competent, honest, sober, industrious, and trustworthy. Nine years' character.—**TOM BROWN**, Esq., Summerhill, Balford, Kent.

GARDENER (HEAD, OF GOOD SINGLE-HANDED).—Vines, Melons, Cucumbers, Tomatoes, &c. Stove and Greenhouse Plants, Flower and Kitchen Garden. Good character.—**A. BOOKER**, 143, Steel Road, Acton Lane, Willesden.

GARDENER (SINGLE-HANDED OR SECOND).—Age 26; experienced in all branches. Good reference.—**E. L.**, 3, Beechfield Cottages, Promley, Kent.

GARDENER (SINGLE-HANDED, OR OTHERWISE).—Age 20, married, two children, youngest, age 6. Would not object to cows. Two and a-half years' good character.—**A. GROOMBRIDGE**, Limpfield, Oxted, Surrey.

GARDENER (SINGLE-HANDED).—Age 29, married; thoroughly experienced in all branches. Eleven years' good character. Disengaged now.—**W. FLEET**, 2, Sherwood Road, Harrow.

GARDENER (SINGLE-HANDED), OR WHERE help is given.—Age 25, single; well experienced in Fruit and Flowers. Good reference.—**J. E.**, 41, Wellington Street, London, W.C.

GARDENER good SINGLE-HANDED, OR HEAD WORKING, where two are kept.—Middle-aged, married; life experience in all branches.—**M. G.**, Mr. Raes, Market Place, East Finchley.

GARDENER (SINGLE-HANDED, OR HEAD where two are kept).—Age 30, married one child. Good character. Used to Vines, Flowers, and Kitchen Garden.—**T. A.**, The Lodge, Kendall Hall, El-tree, Herts.

GARDENER (SINGLE-HANDED).—Age 25, single; understands Greenhouse, Flower and Kitchen Garden. Two years in last place.—**BLUNDELL**, Archbishop's Lodge, Addington Park, Croydon, Surrey.

GARDENER (SINGLE-HANDED).—Age 28, single; understands Greenhouses, and Flower and Kitchen Gardens; six years in present place; character will bear strictest investigation; Churchman.—Apply, stating wages, &c., to **J. THOMPSON**, Woore, near Newcastle, Staffs.

GARDENER (SINGLE-HANDED), OR WHERE help is given.—Advertiser can recommend a young man (age 25) as above. Married, no family; strictly honest and sober.—**R. SMAILL**, Gardener, Hansdon Bury, Ware, Herts.

GARDENER (SINGLE-HANDED).—Age 32, married. Practical experience in all branches. Willing to make himself useful. Excellent references.—**M.**, Mr. Fox, Hinton Graze, Suffron Walden.

GARDENER.—Age 38, married.—A gentleman wishes to recommend his Gardener, thoroughly experienced.—**BUCKLAND**, The Haven, Crowley Down, Sussex.

GARDENER, good.—Age 46, married, three children. Seven years' in present situation.—**A. E.**, 1, Holcombe Villas, Trevelyan Road, Lower Tooting, S.W.

GARDENER (age 20), Outdoor or Second in Greenhouse.—**SIR JOHN JENNINGS** desires to recommend an Under Gardener, steady, industrious, capable. Seven years' character.—**W. NORMAN**, 2, Mulera Vale, Stafford Road, Bourne-mouth.

GARDENER.—Age 23, single; been used to Inside and Out; good character from last place.—**T. R.**, Mr. Davis, Bridge House, near Norbury Station, South Streatham.

GARDENER (SECOND).—A young man (age 22) seeks situation as above; can be recommended by **HEAD GARDENER**, Walberton House, Arundel, Sussex, with whom he has been for two years and three months.

GARDENER (SECOND).—Age 27, single; experience Inside and Out. Good references. Six years' in present situation.—**GEO. BORN**, Thorncombe, Chard.

GARDENER (SECOND, OR SINGLE-HANDED) in a Gentleman's Garden.—A young man (age 22) seeks a situation as above. Several years' experience in all branches. Good reference.—**E. B.**, 26, Martin Road, Bromley, Kent.

GARDENER (SECOND), where five or more are kept.—Age 22; eight years' experience; three and two years' good references.—**T. QUINNELL**, The Oaks, Emsworth, Hants.

GARDENER (SECOND), in the Houses.—Age 23. Nine years' experience in all branches; good characters. Both preferred.—**S. FUNNELL**, The Gardens, Little Gaddensden House, Birkhamstead, Herts.

GARDENER (SECOND, OR GOOD UNDER).—Age 27, single; Inside and Out. First-class testimonials and excellent character from present good establishment.—**F. J. K.**, 21, Farm Avenue, Streatham, Surrey, S.W.

GARDENER (SECOND).—Age 24; ten years' practical experience in well-kept private places, both Inside and Out. Can be well recommended. Both preferred.—**FOREMAN**, 20, King Street, Chelsea, S.W.

GARDENER (SECOND, OR UNDER), Inside and Out. Age 27. Good references.—**J. SARGENT**, The Gardens, West Lodge, Hatley Wood, Barnet, Herts.

GARDENER (UNDER).—A youth requires re-engagement as above. Good references.—**M. PHILLIPS**, 3, Brooke Cottages, Lower Tottenham.

GARDENER (UNDER), Inside, or Inside and Out.—Age 19; can be well recommended; two years in present situation.—**F. J. SMITH**, Queen's Road, Newick, Lewes.

To Gardeners.

GARDENER (UNDER), in a good Establishment.—A young man (age 21) desires re-engagement as above. Good references.—**CHARLES STONEHOUSE**, H. Ackerley, Esq., Burtholme, Wigou.

GARDENER (UNDER).—Age 21; three years' experience. Two and a-half years' references. Willing and obliging. Gentleman's establishment preferred.—**G. W.**, 15, Mauden Street, West Kensington, W.

GARDENER (UNDER), age 21, requires a situation Inside and Out. Can have good character from last situation. Both preferred. Near London.—**R. BARTON**, The Rise, Sunningdale, Berks.

TO FLORISTS.—Advertiser has successfully managed a large Florist business in a Northern town for the last twelve years; is of good address, with a thorough knowledge of the Wreath, Bouquet, and Decorative Trade. Will be disengaged in August.—**J. J.**, 8, Park Road, Wimbledon, S.W.

FOREMAN, in the Houses.—Age 25; good references.—**E. ANFORD**, The Gardens, Longford Castle, Salisbury.

FLORIST.—A young Lady who has been apprenticed for two years to the Florist and Nursery Business seeks an engagement as IMPROVER; good reference.—**A.**, Westra Cottage, Egham.

HOLLOWAY'S OINTMENT and PILLS.—For the cure of burns, scalds, wounds, and ulcers, this justly celebrated Ointment stands unrivalled. Its balsamic virtues, immediately on application, lull the pain and smarting, protect the exposed nerves from the air, give to the vessels the vigour necessary to heal the sore, and confer on the blood a purity which permits it only to lay down healthy flesh in place of that destroyed. Holloway's Pills, simultaneously taken, must assist the Ointment's purifying and soothing power. Together these medicines act like a charm; no invalid, after a fair trial, has found them fail to relieve his pain, or completely cure his disease. The combined action of the Ointment and Pills, in all disorders, is too irresistible to be withstood.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S PATENT HYDRAULIC RAMS & RAM-PUMPS, Self-acting, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

KEITH'S BOILERS are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

SALES BY AUCTION.

Thursday Next. SPECIAL SALE OF ORCHIDS IN FLOWER AND BUD, TREE FERNS, &c.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 14, at half-past 12 o'clock precisely, a very fine COLLECTION OF ORCHIDS in FLOWER and BUD, comprising 5 grand specimens of Arides Schroderii, choice Dendrobiums, Odontoglossums, Masdevallias, well-grown Oncidiums, Ansellia species in flower from East Africa, Angrecum species, &c., &c. Also a quantity of TREE FERNS from New Zealand, COOL ORCHIDS, 30 barrels of CRINUMS, received direct, &c., &c. On view morning of Sale, and Catalogues had.

Friday Next.—Without Reserve. About 300 lots of well-grown ESTABLISHED ORCHIDS, some of them Specimen Plants which have been so successfully exhibited at Metropolitan and Provincial Shows during recent years, by order of Mr. H. JAMES, who is giving up exhibiting, and having sold a portion of the Freehold Nursery, is compelled to pull down eight of his greenhouses and clear the ground at once.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 15, at half-past 12 o'clock, absolutely without reserve, about 350 lots of extremely well-grown ESTABLISHED ORCHIDS, all in splendid health.

Amongst the specimens, the following may be mentioned:—Cymbidium Lowianum, several fine varieties. Cypripedium insigne (Lord Londesborough's variety). Harpophyllum giganteum. Oncidium suavis (Veitch's variety). Brassia verrucosa. Vanda Lowii, a grand specimen (Baron Schiller's celebrated plant). Dendrobium nobile nobilium (good plants). Ainsworthii. Also several plants of Anthurium Schertzerianum (hybrids), a fine plant of Gloriosa grandiflora in flower (very rare), Sarraacenia, Nepenthes, &c.

On view morning of Sale, and Catalogues had. N.B.—The whole of the well-known EXHIBITION STOVE and GREENHOUSE PLANTS will be SOLD, on the Premises, the Castle Nursery, Lower Norwood, on THURSDAY, July 21, 1892. See separate Advertisement.

Lower Norwood. IMPORTANT UNRESERVED SALE of the well-known and valuable collection of EXHIBITION STOVE and GREENHOUSE PLANTS, which have been so successfully shown for many years at the leading London and provincial shows by order of Mr. HENRY JAMES, who is giving up exhibiting.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, The Castle Nursery, Lower Norwood, on THURSDAY, July 21, at 12 o'clock, the valuable collection of EXHIBITION STOVE and GREENHOUSE PLANTS, comprising well-grown specimen Kentias and other Palms, Stephanotis, a fine lot of Agapanthus albus, coming into flower; splendid specimen Heaths, 6 to 8 feet through; Allamandas Hendersonii, Cathartica, grandiflora, and nobilis; Ixoras, Ferns, 50 magnificent specimen Azaleas, probably the best collection in the country; fine examples of Crotons, Anthuriums (a speciality at this nursery), Chrysanthemums, and other plants.

May be viewed three days prior to the Sale. Catalogues may be had of Mr. H. JAMES on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Stamford Hill. Preliminary Notice. ABSOLUTE CLEARANCE SALE. Proprietor going abroad. By order of Mr. W. OWEN.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, 105, Stamford Hill, N., the LAST WEEK in JULY, the ERECTIONS of 6 GREENHOUSES, about 3,000 feet of 4-inch HOT-WATER PIPING, thousands of PALMS, including several Specimens; and other Stock.

Further particulars will appear next week.

To the Trade and Others.—Dissolution of Partnership. Extensive SALE of NURSERY STOCK, at New Goldenacre Nurseries, Edinburgh, on JULY 14, 1892, at 11 o'clock Forenoon.

MR. DAVID MITCHELL, HORTICULTURAL AUCTIONEER, has been instructed by Mr. D. W. Thomson (owing to Dissolution of Partnership, and Alterations of New Greenhouses at New Goldenacre Nurseries) to DISPOSE of, by PUBLIC AUCTION, on the above date, the WHOLE of the MAGNIFICENT STOCK of PLANTS, consisting of Thousands of Palms of all sorts and sizes, comprising choice Kentias, Latacias, Scaforthias, Coccos, and Geonomas; beautifully coloured Dracaenas, and Crotons in variety, Anthuriums, Pandanus, fine lot of Eucharis and Azaleas (including large number of Deutsche Perie), Gardenias, Ferns, Orchids, Pitcher Plants, Stove and Greenhouse Climbers, Liliiums, and Miscellaneous Plants in quantity.

Catalogues, in preparation, may be had from Mr. D. W. Thomson, New Goldenacre Nurseries, Edinburgh; or of the Auctioneer, 6, Comely Bank. Cable Cars from Hanover Street to Goldenacre Toll every few minutes. Plants now on view.—Edinburgh, June 25.

WANTED to RENT, a PIECE of GROUND with some GLASS, for Market Purposes. Apply, MATTHEWS, The Lodge, Aberdeen Park, N.

WANTED to RENT, on Lease, about 2 Acres of LAND, near good train service, within 20 miles of Covent Garden.—J. SHAMBROOK, Hamel's, Buntingford, Herts.

To Florists, Gardeners, &c. TO BE LET, a most conveniently situated PLOT of LAND, containing about 23,000 superficial feet, close to Kennington Park, with frontage to two roads; suitable for a Florist's or Gardener's Business. As a whole, or in plots, either on Lease for 7, 14, or 21 years, or Agreement for shorter term.—Apply to—Messrs. BRIANT AND SON, 200, Kennington Park Road, S.E.

FOR SALE, a FREEHOLD MARKET GARDEN PROPERTY, with Greenhouses and Dwelling-house. Private treaty; going concern. Well situated for business; adjoining thriving town. Small capital. Apply to—WILLIAMS and NICHOLSON, Salop House, Oswestry.

TO BE SOLD, a long established GENERAL NURSERY.—A rare opportunity for a man with moderate capital.—Address, B. C. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, the Business of a FLORIST'S SHOP and COMPACT NURSERY, all Glass, near Covent Garden; or a PARTNER may be ACCEPTED. This is a chance seldom met with.—W. P., 6, Eastcote Street, Stockwell.

To Nurserymen and others. FOR SALE, by Private Treaty, the very productive FREEHOLD NURSERY GROUNDS situate and fronting to the Village Green, Car Colston, Notts, three miles from Bingham Station, on the Great Northern railway; together with the extensive ranges of Glasshouses, in excellent condition. Residence and cottage, stable, &c. Total area, 3 acres.

For cards to view and farther particulars, apply to Mr. THOS. NEALE, Estate Agent and Auctioneer, Wheeler Gate, Nottingham.

To Fruit Growers, Nurserymen and Others. GOOD ARABLE and MEADOW LAND to be LET or SOLD. Close to the main road at Ponder's End (9 miles from London). Long leases granted. Rent, £12 per acre per annum, with option to purchase the Freehold any time during the first nine years. Several large Market Nurseries are established on the Estate. Full particulars of A. and G. GUIVER, Land Agents, Ponder's End.

LEYTON (Essex).—TO BE SOLD, FIVE GREENHOUSES, well-heated, and in good repair, standing on 1/2 acre of ground, viz., Span-roof, 47 by 18. 47 by 11, 45 by 13; Lean-to, 89 by 12, and 21 by 7. Lease will be given of ground and six-roomed dwelling-house, and if needed more ground can be had near. Man with small capital could do well; good opening for jobbing.—Apply, SMALL AND CO., 23, Lime Street, London, E.C.

PICTURESQUE ROCK SCENERY.—Forming Waterfalls, Lakes, and Streams, Ferneries, Winter Gardens, Alpineries, &c., as in hundreds of places about the kingdom, including at Aldenham House, Elstree, so faithfully illustrated in this journal of November 21, executed by PULHAM AND SON, 50, Finsbury Square, London, E.C., and Broxbourne, Herts. Photo Illustrated Book sent for inspection on receipt of twelve stamps.

WORDSLEY, STOURBRIDGE.

STRAWBERRIES

Laxton's "Sensation."

NEW VARIETY for 1892-93

An enormous second early variety, of good flavour, and probably the largest Strawberry ever introduced. Fruit of the "President" type, but quite double the size; foliage and stems very strong, and the large fruits produced in wonderful clusters; altogether, a remarkable and distinct Strawberry, and appearances indicate that it will make a good forcing sort.

Open Ground Runners £3 per 100; 12s. per doz.
(Runners, in small pots, half-price extra).

LAXTON'S "SCARLET QUEEN."

Certificated at R.H.S. Fruit Conference, 1891.

The best first early Strawberry—very early—fine colour and shape, and the richest flavour.

Mr. DIVERS, writing in the *Gardeners' Chronicle*, June 11, says, "he was surprised to find a ripe fruit in the open on June 3, whilst 'King of the Earlies,' usually the first, showed no signs of colouring, the flavour of 'Scarlet Queen' being very good, and a variety likely to prove valuable as a first early."

Mr. G. MONRO, Saleman, Covent Garden Market, also writes:—"Far in advance of 'Noble'; fine flavour, and likely to make a marketable fruit."

Mr. G. O. BUNYARD, the well-known pomologist and nurseryman of Maidstone, says:—"I am pleased with your new Strawberries ('Cardinal,' 'White Knight,' and 'Scarlet Queen'). 'Competitor' is good this year, and stood the winter better than any." Price, £2 per 100; 8s. per doz. (in small pots, half extra).

LAXTON'S "COMPETITOR."

An excellent and very large and prolific Strawberry, following closely on the heels of "Noble" with a distinct Apricot-like flavour, and a wonderful bearer. Plant, very hardy and vigorous. Price, £1 per 100; 4s. per doz. (in small pots, half extra).

LAXTON'S "WHITE KNIGHT."

Certificated at Fruit Conference, 1891.

One of the richest-flavoured and most distinct Strawberries ever sent out—a mid-season variety—scarlet on the upper and ivory white on the under sides. Possesses the "Hautbois" flavour. Prices, same as for "Competitor."

LAXTON'S "CARDINAL."

Very large, second early; fruit sweet, plant hardy; quite a distinct variety. Prices, same as for "Competitor."

LAXTON'S "LATEST OF ALL."

The best late Strawberry, and the largest and best late variety. A seedling from "British Queen," but much later; very distinct.

Price, 12s. per 100; 22s. 6d. per 100, in small pots.

LAXTON'S "COMMANDER."

One of the best varieties I have raised—from a cross between "British Queen" and "President." I can confidently recommend this Strawberry, both for forcing and the open ground.

Price, 8s. per 100; in small pots, 20s. per 100.

LAXTON'S "NOBLE."

Every season adds to the popularity of this wonderfully large and early fruit; immense breadths of it are now grown by all the principal market growers.

Price, 6s. per 100; in small pots, 16s. per 100.

"JOHN RUSKIN."

This variety is becoming very popular, on account of its earliness, hardiness, and fertility.

Price, 8s. per 100; in small pots, 20s. per 100.

THE Gardeners' Chronicle.

SATURDAY, JULY 9, 1892.

THE BOTANICAL GARDEN, DUBLIN.

JUST now, when the tercentenary celebrations of the University of Dublin, founded by Elizabeth in 1591, are taking place, we may specially allude to the botanical gardens belonging to that time-honoured institution.

The present Botanical Garden of Trinity College appears to be the third of its kind as attached to the University. On June 14, 1710, a site was assigned by the Board of that date for the erection of a medical school, and we learn on the best* of authority, that the laboratory and anatomical theatre were erected at the south-east corner of the "Physic Garden," which at that time appears to have occupied the site of the present library, or, according to some traditions, that portion of the present Fellows' garden lying between the library and the Nassau Street boundary. About the year 1790, there was a pressing want of a botanic garden in Dublin, and a Committee of the Irish House of Commons strongly reported in favour of one that should be common to the University, the College of Physicians, and the Dublin Society, and Provost Hutchinson zealously endeavoured to have this plan carried out by Parliament. On June 6, 1791, at a board meeting, a letter was read from the Dublin Society, asking the College to agree to the project of a joint botanic garden, and the reply of the Provost and Senior Fellows expressed a doubt as to whether the scheme could be entertained. Another attempt to form a garden between the College of Physicians and the Provost and Fellows of Trinity College likewise failed.

In the meantime, Dr. Hill, the Professor of Botany, had rented some ground at Harold's Cross, for the purpose of a botanic garden, and he was assisted to some extent by the College. It was not until April, 1801, that a Curator was appointed, and his salary was fixed in March, 1805, at £130 yearly, out of which he was to employ two labourers all the year round, and two in addition from March to December. It is clear that the plants and the houses in the Harold's Cross garden were to a very large extent, if not altogether, the private property of Dr. Hill, for we find in the College accounts of 1803 the following entry:—"Dr. Hill, allowed him by the award of the arbitrators, to whom the cause between the College and him concerning the botany garden was referred, £618 10s. 5d." "From a statement of Provost Hutchinson, which remains, we gather that he was the means of securing for the Dublin Garden, through Sir Joseph Banks, many of the plants and seeds, brought to England from the South Seas by the

* Dr. J. W. Stubbs, *The History of the University of Dublin*, from 1591 to 1800, p. 182.

DESCRIPTIVE LISTS ON APPLICATION TO

THOMAS LAXTON, Seed Grower, BEDFORD.

members of the exploring expeditions at the time."

In July, 1806, the site of the present botanical garden at Ball's Bridge, was leased by the College for 175 years, at a rent of 15 guineas per acre. The present garden was commenced in the autumn of 1807, and consisted of about 3 acres of ground as represented to-day by the botanical portion proper, viz., that situated within the old walls, and the oldest and largest of the trees in this enclosure were mostly planted in the spring of 1808. So that the fine and graceful American Elm, the tallest tree in the garden, the Copper Beech, the characteristic Cedar of Lebanon, and the Italian Stone Pine, the Manna, or flowering Ash, the weeping Elm beside the pond, and other less notable trees, have all grown to their present dimensions in a little over 80 years.

In 1832 an addition of about 2 acres was made adjoining the Blackrock Road, now Pembroke Road, so that the finest of the specimen Hollies, the weeping Beech, Pinus, Platanus, Oak, Arbutus, and Garrya here to be seen are only about 60 years old at the most, and show what has proved possible in a town garden in so short a time.

The latest addition to the garden was made in 1848 by the further enclosure of about 3 acres, or less, which now adjoins the Lansdowne Road, this having been taken in "with a view to admit of a screen being planted parallel to the older north-west wall, and thus afford sufficient protection against smoke, buildings, &c." The last extract from a report prepared by the first curator and designer of the garden, the late James Townsend Mackay, LL.D., illustrates his ability and far-seeing knowledge as a landscape gardener, for on these two additions, and the exquisite fitness of their fringe of Ilex or evergreen Oaks and Hollies depends whatever is verdant and beautiful, and sheltered in the garden at the present time.

From its commencement, the College Garden became an attraction under Dr. Mackay, to the most enterprising and studious of gardeners, and amongst others who graduated within its walls, we may mention Fraser, the celebrated landscape-gardener and author of a road-map of Ireland; the late Dr. David Moore, afterwards Director of Glasnevin Botanic Gardens, and his brother, Dr. Charles Moore, now Director of Sydney Botanical Gardens, New South Wales, were also employed here in Mackay's best days, as also at a later date were the late Mr. Ambrose Balfe, afterwards secretary for many years to the Royal Horticultural Society of Ireland; Mr. Michael Dowd, and many others.

Mr. John Bain, A.L.S., who was Assistant-Curator in Mackay's time, afterwards succeeded him as Curator, and the gardens were much improved under his care. Altogether, Mr. Bain was over forty years employed in the garden. His keenness as a botanist, especially his critical knowledge of native plants, and his remarkable skill as a cultivator, were recognised by the most noted botanists of the time, such as Professor Allman, Dr. William Harvey, Sir W. Hooker, the late Mr. Jas. Veitch, Rev. Wm. Ellis, and Archbishop Whately, who for many years was a constant visitor to the gardens. At this time many then rare plants were grown here with a success perhaps never surpassed. Of such were *Vanda cœrulea*, the true old *Cattleya labiata* and *C. violacea Harrisoni*, *Renanthera coccinea*, *Zygopetalum Mackayi*, *Mackaya bella* (a shrubby Cape Acanthad, founded by Harvey in compliment to Mackay) (since called *Asystasia* by Hooker and Bentham in

Gen. Plan.), *Erica Mackayana*, *Saxifraga elegans*, &c., were also introduced to public notice by Mackay. Here also Mr. W. Ellis and Sir W. Hooker alike saw *Ouvirandra fenestralis*, *Dionaea Muscipula*, *Cephalotus follicularis*, and the North American *Sarracenia*, in luxuriant health and beauty; and the Cape *Disa grandiflora*, bore flowers as large, and as fine in colour, as Harvey had seen them on Table Mountain only a year or two before. Mr. F. W. Moore, now of Glasnevin, also had charge of the gardens, and by his zeal and well-directed industry contributed to their present prosperous condition.

Without undue boasting, it may fairly claim to be, in proportion to its size and general conveniences, a garden as rich in vegetation of all kinds as exists elsewhere in Europe. The main drawback is its proximity to dusty roads, and to the smoke of the town. Its best features are excellent shelter—for reasons before expressed, a remarkably deep alluvial soil overlying a gravelly subsoil resting on chalk limestone, abundant moisture, and a climate much to be envied by those of more northern latitudes, or farther from the sea.

Many plants only half-hardy elsewhere, even in the same latitude, here exist perfectly in the open air. Especially noticeable in the garden are the walls which, while giving shelter from the prevailing winds, also serve in the conservation of the rarer of half-hardy shrubs, such as the Loquat, Carob Bean, *Mutisia decurrens*, and the Chilean *Colletias*; Australian Blue Gums, or *Eucalypti*; the Japanese Wine-berry (*Rubus phœnicoliasus*), "Winter's Bark" (*Drimys Winteri*) from Magellan, and *Wistaria* from Japan; *Clematis alpina*, a sort of shrubby *Anemone*, from Austria; *Veronica Hulkeana* from New Zealand, and *Berberidopsis corollina* from high up on the Chilean Andes. *Choisya ternata*, *Smilax latifolia*, *Zizyphus (Paliurus) spina-Christi*; *Solanum crispum*, and *Mahonia nepalensis*, also do well here. Here and there also various interesting rock-plants from the limestone or chalk, the granite from basal Cambrian, or old red sandstone, are here grown in extemporised niches or "pockets" especially prepared for them. You may see the Pyrenean *Ramondias* so grown, also *Edelweiss* from the Swiss Alps, and *Androsaces* such as *A. lanuginosa* from the Himalayas. The last-named plant was first flowered in this garden by Dr. Mackay in 1842. *Dianthus*, *Linarias*, *Erinus* and *Iris* of many kinds are at home on these wall tops, and quite recently a special hollow plant wall has been erected for these and other denizens of the rocky places of the temperate world. A small pond fed by the Dodder River, is rich in *Aponogeton* and *Nymphæas*, several of M. Latour Marliac's hybrid kinds having passed through the last winter unscathed. The great *Gunnera manicata*, with leaves 5 to 7 feet across, is here quite at home, as also are the red and green-veined forms of *G. scabra*.

The plant-houses, eight in number, have been erected at different times, and although scarcely up to modern requirements, they are rich in plants for botanical and decorative purposes. *Doryanthes excelsa* has just flowered on a gigantic scape 10 feet in height. *Barnardesia rosea*, *Solandra viridiflora*, *Ruscus androgynus*, *Trochetia Blackburniana*, *Theophrasta Jussieui*, and *Dracœna Draco* also flower here every year. There is a small but representative collection of Orchids, including some rare species. On damp walls *Pothos celatocaulis* olings as tightly as if pasted, and there are collections of insectivorous plants and fine masses of the Killarney Fern (*Trichomanes radicans*). Two of the rarest of plants in the garden are *Xanthorrhœa hastata*,

which has flowered here, and the still more rare *X. quadrangulata*, both healthy specimens. There is also a large and venerable specimen of the giant Cycad of the Cape, viz., *Macrozamia Altensteinii*.

The strong points of the garden are its large herbaceous borders, now gay with many summer flowers. It is also pre-eminently a garden of hardy bulbous flowers of all sorts, Snowdrops, Crocus, Narcissus, Tulips, Iris, Lilies of many kinds; and to see the Crocus or the Narcissi at their best here, late in March or early in April, is a sight not readily to be forgotten.

Our illustrations show at fig. 6 (p. 35) a view of a pond overshadowed by a Weeping Elm with *Aciphyllas* and *Yuccas* in the foreground, yellow-berried Holly beyond, and *Arbutus Andrachne* to the right. At fig. 8 (p. 43) is shown a view of an old wall covered alluded to in the text. The photographs were executed by Mr. Greenwood Pim.

NEW OR NOTEWORTHY PLANTS.

ONCIDIUM ROLFEANUM, Sander.*

At the recent show of the Royal Horticultural Society, held in the Inner Temple Gardens on May 25 and 26, an *Oncidium* was exhibited by Messrs. F. Sander & Co., of St. Albans, under the above name, and to which a Botanical Certificate was awarded (see *Gardeners' Chronicle*, 1892, pt. 1, pp. 698, 700). Flowers have now been received of it, and it will, therefore, be advisable to place its characters upon record. It belongs to the *Microchila* section of the genus, and is allied to *O. Kienastianum*, Rehb. f., and *O. trilingue*, Lindl. To the former, known to me by description only, it must stand very close, yet there are characters which, if correctly given, prove that the present one is specifically distinct. The native country, too, may be different, as the present species is said to hail from Columbia, while *O. Kienastianum* was described as a Rœzlian importation, "one might guess from Northern Peru." The sepals are brown, the upper one rather darker and irregularly margined with yellow; the petals yellow, spotted, and somewhat barred with brown; and the lip yellow, marbled with brown, and some dull purple on the basal auricles. The technical characters of this remarkable species are pointed out in the annexed description. It may be added, that several distinct species of this section of the genus have not yet been introduced to cultivation. *R. A. Rolfe, Kew.*

HIEBENSTREITIA COMOSA SERRATIFOLIA.

Under this name Mr. Gumbleton forwards us a spike of a curious and pretty greenhouse plant. It has nearly glabrous, sessile, lanceolate, deeply and remotely toothed leaves. The flowers are very numerous, and densely arranged on erect, cylindrical spikes, 6 to 7 inches long. The individual flowers are small (less than half an inch in length), with a peculiar structure, the calyx being represented by two boat-shaped, somewhat leafy segments, united at one side at the base, and of which one is larger and acuminate, the other, simply pointed. The corolla has a slender tube as long as the calyx, and expanding at the top into a relatively broad 4-lobed limb, from each side of which are given off two stamens, one above another, each with a one-celled anther, and whose central disc is occupied

* *Oncidium Rolfeanum*, Sander.—Raceme long, slightly branched. Bracts concave, ovate-oblong, subacute, 6 to 8 lin. long. Sepals unguiculate, auricled at base; dorsal one with broadly ovate acute undulate limb, 8 lines long; by 5 lines broad, brown, irregularly margined with yellow; the lateral ones 10 lines long, paler, and without yellow margin, but otherwise similar. Petals obssessile with broad base, ovate, acute, and with somewhat obliquely-reflexed margin, crispo-undulate, 7 lines long, yellow, spotted and somewhat barred with brown. Lip 7 lines long, three-lobed; front lobe elliptical-oblong, obtuse or subacute, very undulate, yellow, marbled with cinnamon-brown; side lobes rounded and upturned in the middle, forming a cavity on either side of the crest, yellow, margined with deep brown, constricted above the truncate-bastate dull purple base; crest complex, yellow, with a few dull sepia blotches on basal half; in front are situated three oblong yellow appendages, the side ones concave and obtuse, the middle one bidentate, and prolonged behind as a sharp keel to near the base of the much-swollen crest; at the summit is a pair of rounded calli, one on either side, and below these several irregular lateral teeth opposite the cavity formed by the upturned rim of the side lobes. Column 3 lines long, with minute linear fleshy wings. Native of Columbia.

by a broad orange-coloured blotch, contrasting with the creamy colour of the rest of the flower. The ovary is concealed within the base of the corolla-tube, oblong, green, with a little green honey-gland at one side at the base, and surmounted by a long linear atrap-shaped style, projecting beyond the corolla-tube, and as long as its lobes, or nearly so. A single ovule hangs from the inner angle of each of the two cavities of the ovary. These details are not interesting, save to the professed botanist. Horticulturists, however, will admire the elegant flower-spikes, with their densely-packed mass of orange-blotched corollas, which produce an effect similar to that of the more highly-coloured Mignonette, though produced by other means. The orange blotch acts

of *O. Rossii*, *O. Cervantesii*, &c., though it possesses one or two anomalous characters. All things considered, I think it must stand next the Guatemalan *O. stellatum*, Lindl., which agrees in the absence of column wings, though that has much smaller solitary flowers with narrower segments. The white sepals and petals with the purple stain at the base recall in some respects a small edition of *Miltonia Roezlii*, yet the stalked lip and crest and other characters are unquestionably those of the first-named group. The large membranaceous rounded front lobe of the lip is white, covered with numerous light violet spots. The side lobes are reduced to an erect narrow margin on either side of the fleshy unguis, and terminate in an acute angle at the base

CULTURE VERSUS NATURE.*

"All knowledge is of use if applied aright; no knowledge is of use if applied awry."—Prof. M. Foster.

(Continued from p. 216, vol. 21.)

We have all heard the story of the gardener who inquired of the philosopher "why the weeds grew more rampantly in his garden than the flowers." "You see," said the wise man, "Nature is mother to the weeds, but she is only stepmother to the flowers." Even this view is not ever and always right, because we know (as Dean Herbert told us long ago) that certain species of plants are not always happiest, i.e., most luxuriant and re-productive in their native habitats. For example, we can take the Scotch Thistle or the English Sweet Briar, both

FIG. 6.—VIEW IN THE BOTANIC GARDEN, TRINITY COLLEGE, DUBLIN. (SEE P. 33)

probably as a sign-board to indicate the whereabouts of nectar. Thus directed in its course to the store, it must needs come in contact with the anthers, and remove some of the pollen to be conveyed to the strap-like stigmas of some other flower. The genus, which was dedicated to Hebenstreit, a professor at Leipsig, who died in 1757, belongs to Selaginaceæ, a family which fits in somewhere in the neighbourhood of Verbenaceæ, Scrophulariaceæ, and Myoporaceæ.

ONOTOGLOSSUM PLATYCHEILUM.

This very distinct and charming little *Odontoglossum* was exhibited by R. J. Measures, Esq., of Cambridge Lodge, Flodden Road, Camberwell, (gr., Mr. H. Simpkins), at a meeting of the Royal Horticultural Society on March 22 last, and was described and figured by Mr. Weathers, on p. 587 of the last volume. Nothing has been stated as to its origin, though I suspect it to be Central American, as its affinity is with the group

of the pair of acute tooth-like crests. It is a very interesting addition to the group. I append a full description of the plant.* R. A. Rolfe.

* *Odontoglossum platycheilum*.—Pseudobulbs ovoid, 1½ to 1¾ inch long. Leaves narrowly lanceolate-linear, acute, carinate, 7 to 9 inches long; scape not half as long as the leaves, at present two-flowered. Flowers large. Bracts ovate-lanceolate, acuminate, 5 lines long. Pedicelled ovary sharply triquetrous, 1½ inch long. Sepals subconnivent, lanceolate-linear, shortly acuminate, strongly carinate, 1 inch long, bluish-white, with a dull light purple blotch at extreme base. Petals similar, except in the absence of the keel. Lip obscurely three-lobed; front lobe large flat and membranaceous, broadly ovate-orbicular, emarginate and obscurely crenulate, over 14 lines broad, by nearly as many long, white, with numerous light violet spots over its entire surface; side lobes reduced to an erect narrow margin on either side of the fleshy unguis, and terminating in an acute angle at the base of the keels, pale yellowish-white, with a pair of yellow spots on either side; keels consisting of a pair of acute teeth, pale yellowish-white in colour; unguis six lines long. Column clavate, eight lines long, pale yellowish-white; stigma suffused with pale dull violet, wings reduced to a narrow fleshy margin. R. A. Rolfe.

great nuisances to the Australian settlers; or the south European Cardoon, which has completely overrun some of the great Pampas or plains of South America, to the exclusion of their native vegetation.

Observation proves to us that some plants have a very wide range of climatic adaptability, such as the examples to which we have just alluded; while on the other hand we have plants that rarely do well except in their native places, such as the Durian (*Durio zibethinus*) and the Mangosteen (*Garcinia Maogostana*). Again we have the Chinese Orchid (*Phaius grandifolius*) that is naturalised as it wild in Jamaica, and the matted and luxuriant Reed Orchid of Singapore (*Bromheadia palustris*), or the lovely *Lycopodium cernuum* that practically defies cultivation.

Gardening is essentially an art of trying experiments, and this is so in part because our physical

* A paper prepared by F. W. Burbidge, M.A., Curator, Botanic Garden, Trinity College, Dublin, and read, in his absence, at the meeting of the Horticultural Club, Tuesday, June 7.

knowledge of plants is so imperfect. In a word, we have not yet learned that the laws of a plant's physical structure, formed as they are by climate, &c., must necessarily govern, to a great extent, its cultural requirements. Broadly speaking, gardeners know that a thickened epidermis (as in Cacti and succulent plants generally), means that they thrive in a dry atmosphere, and in sunshine rather than in shade. The same is true of plants with thick woolly, or hairy or powdered foliage. On the other hand, Ferns of a thin translucent texture, or delicate-leaved plants with a thin epiderm full of stomata, require a moisture-laden atmosphere, and more or less shade; but there are thousands of cases where we can *à priori* know nothing of a plant's powers of resisting heat or cold, sun or shade, moisture or drought, except by actual experiment. You may collect two plants from a mountain-side, 10,000 feet or so in altitude, near the equator, and one will be perfectly hardy in northern Europe, and the other will die at the first touch of frost. Why this is we do not fully know; but we may at least keep the question in our minds, and hope some day to solve the problem.

I have said, that *à priori* we can never be perfectly certain of the temperatures or soils most suitable for any one plant unless we are carefully told how it exists in a state of Nature. Even when this information is given, it by no means follows that our imitation of native conditions will prove to be best suited to the plant. As we have said, native conditions are not invariably those best for some plants, inasmuch, as they have thriven and increased better when introduced elsewhere. A good gardener is in an analogous position to a good physician, and will prescribe for a plant quite as reasonably as does the physician for a patient totally unknown to him.

It was until quite recently thought that unless a substance was in a soluble state, i.e., soluble in water in the soil, it could not be utilised by the plant. This view is now modified, since it has been found that roots themselves, and especially their growing points, secrete and exude an acid ferment that renders soluble or permeable many substances not actually soluble or dissolvable in water alone. In this way I have seen the underground stolons of "Couch-grass" (*Triticum repens*), bore straight through Potatos and other fleshy tubers or stems; and only the other day I saw a shoot of *Tropaeolum polyphyllum* that had come up through a brick that had happened to be in its way. In a word, the old story that roots follow the line of least resistance is not always, even if often, true.

I am far from feeling that I have exhausted this great subject, rather do I feel that I have merely touched the hem or fringe of the question in a tentative kind of way. "Culture *versus* Nature" is really a question to be solved by each one of us in our own gardens, and I sincerely hope that these observations may be a help rather than a hindrance to our so doing.

SUMMARY.

In conclusion it may be well to formulate a few of the observations in this paper, so as to facilitate discussion—that very life-essence of the reading of papers.

1. Cultivation is the most convenient method to enable us to obtain crops in any particular condition, or place, and at the time when most desired.

2. From the human point of view culture improves Nature, even at her best; but from the purely natural point of view, this is not always the case.

3. Culture is often best, easiest, and most profitable in climates similar to, even if not actually the same, as those where the plants are naturally found. In any case, suitability of soil and climate (other things, such as cost of land, skilled labour, and manures being equal) are the most essential points in profitable cultivation.

4. Prejudice in plant-culture is not to be tolerated. The golden rule is to try experiments in planting under different conditions, and be guided by the evidence of the plants themselves.

5. Human desires are mainly for succulent vegetative growths; large pulpy or sugary fruits or seeds in varying stages, as used for food, and flowers for use or ornament. But Nature's great aim and object, on the other hand, is a crop of fertile seeds, to perpetuate and strengthen the race.

6. Seeing that in nearly every garden there exist different conditions of soil, climate, shelter, aspect, &c., it naturally follows that we cannot dogmatise on cultural methods. Even in the same garden, methods of culture must necessarily vary, just as do the seasons themselves.

7. Successful cultivation is at its best a matter of accurate observation and careful experiment, followed by logical reasoning powers.

8. Gardening, then, is not altogether an empirical art, although best learned or taught by practice in good gardens, in addition to good reading or lectures and demonstrations i.e., practice and well-directed study are better than is either alone.

9. Wild plants are improved, humanly speaking, by culture; so, on the other hand, cultivated plants, as a rule, either die out or revert to their type species if neglected or relegated to a wild state.

10. Note the nitrogen-fixing or accumulating power of leguminous plants.

11. Chemical analysis is not a certain guide to the vital action inside the living plant.

12. Plants may often be economically regarded as mere producing machines, and selection as an improving factor depends on some seedlings being better able to use up nitrogenous matter quickly than are others from the same parent.

13. Some plants have proved more luxuriant and prolific in other countries than their own, showing that plants in their native habitat are not always, even if often, at their best.

14. *A priori* we may have no evidence of a plant's elasticity, either under climatic variations or cultivation, but reasoning from analogy, and the instincts possessed by the gardener are generally enough to solve the problem.

15. Physical structure and the general appearance of plants alike suggest to experts a course of treatment, just as the signs of disease in a sick person would do to a physician who had to treat a patient to whom he could not say a word.

16. Roots are now known to have the power of dissolving substances by their acid secretions and exudations that are not soluble in water.

17. The main point is, for the cultivator to ascertain the dominant desires, so to speak, of the plants to be grown. Lime-loving plants are often peat-haters, and *vice versa*. A good analysis of soil will be a broad guide as to the dominant manures or other additions requisite for particular crops. Farm-yard manure, strengthened with chemical manures, is generally better than either alone, as we here secure the maximum of mechanical or physical, as well as of chemical stimulus. *F. W. Burbidge.*

ORCHID NOTES AND GLEANINGS.

EULOPHELLEA ELISABETHÆ.

"QUEEN ELIZABETH of Roumania's Eulophiella." How does this sound in Roumanian? In botany it is attached to a very curious and interesting plant, which Mr. Rolfe is unable to make fit into any known genus of Orchids. It has the habit of a *Catasetum* or *Eulophia*, with lanceolate plicated leaves, 2 feet long. The scape arises from the base of the young pseudobulb, is a foot long, and of a deep purple colour, as also are the boat-shaped bracts. The flowers are nearly circular in outline, sepals fleshy, stained at the back with rosy red, the tips white, in front like the petals—white; lip broad, three-lobed, articulated to the column, white; the anterior lobe bright yellow, with some bristle-like processes directed forwards. Near the base of the lip is a rather large fleshy semicircular callus, of a deep orange colour, and from which extend a pair of slightly diverging white keels, each terminating in a free tooth, tipped with orange. There is no trace of

either spur or sac. From these and other characters, for which we must refer to the original description. Mr. Rolfe places the plant in the subtribe *Cyrtopodiæ*, near to *Govenia*. The genus is, however, not very closely allied to any other. A figure is given in the May number of the *Lindenia*, t. 325.

ODONTOGLOSSUM PESCATOREI VAR. LINDENIÆ.

A variety characterised by having either a single violet blotch about the centre of each segment, or two or three smaller ones close together in the same position. *Lindenia*, t. 329.

SACCOLABIUM BELLINUM.

A Burmese species discovered and introduced by Boxall. Sepals and petals greenish-yellow, with numerous large reddish-brown spots, lip bag-like, white, with some purple spots on the interior, limb flattish, yellow spotted, edged with white. *Lindenia*, t. 330.

STANHOPEA MOLIANA.

A new Peruvian species described by Mr. Rolfe in the *Lindenia*, t. 331. The sepals are pale yellowish-white, spotted with light reddish-purple; petals white with ring-like spots; lip white, purple spotted; column winged, yellowish-white. The species is dedicated to M. Jules Van Mol.

TRICHOPIA DREVIS.

A new Peruvian species described by Mr. Rolfe in the *Lindenia*, t. 332. It is a very attractive little plant, its greenish-yellow sepals and petals, with a few large chocolate blotches contrasting effectively with the broad white lip. The lamellæ of the disc are yellow, and there is a faint stain of the same colour on the base of the front lobe of the lip.

CATTELEYA MOSSLE WAGNERI.

A grand example of this fine white *Cattleya*, and which showed some deviations from even the best forms of the ordinary one, comes from G. R. Le Doux, Esq., Langton House, East Moulsey. Its petals are very broad, the sepals flat and not reflexed, and the large labellum has an elongation and fringing of the front lobe similar to that seen in *C. Mendeli*. The plant was procured from the Tauz collection, and its beauty has previously called forth remark.

CATTELEYA WARSCEWICZII (GIGAS).

An example of a noble variety of this—one of the best examples of any *Cattleya* that we have observed, comes from the gardens of Gerard Orby Sloper, Esq., Westrop House, Highworth, Wilts. The spike bears six grand flowers, fine in form, of extraordinary size, and rich in colour.

CATTELEYA MENDELI EMPRESS OF INDIA.

A flower of this surpassingly beautiful variety is sent by R. Brooman White, Esq., Ardarrloch, Garelochhead. The sepals, which are broad and flat, are white tinged with lilac; the broad petals are similar in colour to the sepals, but bear up the middle of the extreme half a rich crimson band or feather, after the manner of *C. Trianae* Backhousiana, and therein and in the glowing purplish crimson of its fringed labellum consists the distinguishing features. It is very distinct, and not likely to be confused with any other variety of *C. Mendeli*.

DISA TRIPETALOIDES.

This pretty species, and the fine crimson *D. racemosa*, are now quite at home in our gardens, and are found to be even more free in growth and flowering than *D. grandiflora*. Two dissimilar examples of *D. tripetaloides* have been in great beauty for some time in the gardens of Mrs. Brighton, The Grove, Stanmore (gr., Mr. J. W. Odell). One variety has bluish-white flowers, profusely dotted with dark rose, and the other is pure white, and the plant has seventeen fully expanded flowers, and nine buds on one spike. This spike, with just the addition of two or three fronds of Maidenhair, would make a choice spray for a lady's wear, its form for such a purpose being perfect.

ODONTOGLOSSUM LEROYANUM X.

In our last issue we quoted from the *Reichenbachia* what we now learn was an inaccurate statement.

The plant in question was obtained by M. Jacob, the head gardener at Armainvilliers, who effected the cross, raised the seedling, and finally had the pleasure of flowering the plant.

A WHITE MASDEVALLIA.

Messrs. Sander send us a photograph of a pure white form of *Maedevallia Harryana* grown in the garden of Henry Graves, Esq., of Orange, New Jersey, U.S.A.; Mr. Rolfe has also received a flower. We hope shortly to publish an illustration and description of this valuable novelty.

NURSERY NOTES.

BEGONIAS AT FOREST HILL.

Messrs. JOHN LAING & SON have thousands of these wonderfully decorative plants in full bloom at the present date, and when a few days ago we were at Forest Hill taking the following notes, we were not at all surprised to hear Mr. Laing say that they were just looking their very best. It is almost needless to talk of the improvement that Messrs. Laing and other well-known raisers have effected in this genus, as any one who takes the slightest interest in horticulture has been surprised again and again at the wonderful "novelties" that this firm and that firm have introduced. The progress has been just as great in the double as in the single-flowered section, and *vice versa*. Success after success following efforts directed toward improving the flower in form, in substance, and in colour, it at last became imperative to turn the attention to the stem and general habit of the plant. Until now, no grower can be found who does not make the "habit" of his strain the first consideration. The following varieties are some that especially attracted our attention amongst an unlimited number almost equally meritorious.

Doubles.—Although the single section create a greater blaze of colour, and are perhaps rather more decorative, the double varieties are the most pleasing when studied on the individual plant, and one of the prettiest varieties in this section is the new "Picotee," which has large erect flowers of a creamy white, and the margin of the petals or florets are bright pink, giving it quite a Picotee appearance.

Lady Theodora Guest, is another new one, with large Camellia-like blooms of an Apricot salmon colour.

A very pretty variety is Lady Gertrude, with flowers of salmon pink, and possessing a white centre. Sir Trevor Lawrence is an extra fine brilliant crimson; it has large flowers, and has erect habit. This is by far the best of the double crimsons. A very floriferous variety is the new Duke of Fife, the blossoms are rosy crimson, large and erect. Lady Dorrington has all the delicacy of a blush-pink, but the flowers are very large, and belong to the Camellia-formed section. Another Camellia-like bloom is that of Mrs. Hudson, a variety named only this year, with deep magenta-rose-coloured blossoms. Lady Wantage is also new; it is rosy-pink, and is very persistent. Baron Schroder is a scarlet one, of three years only; it is a fine variety, erect and free. Laing's Triumph is the largest double yet produced; the flowers are a bright coral colour. Laing's Rosebud is the perfection as yet reached of another kind of bloom, viz., the rose section; it opens almost exactly like a Rose, and is a delicate blush-pink. The last double that we can mention is that which was named last week, in honour of an old and successful Begonia-grower and raiser, Mr. W. Clifford: it is very large, belongs to the Camellia type, and the colour a deep rose.

Singles.—The first of the singles we were obliged to notice was Mrs. J. Chamberlain, introduced last year; it is large and good, and colour a delicate blush. Avalanche has very pure white flowers, and are exceptionally large. Constance, another white, is wonderfully floriferous, and presented quite a picture of beauty. Lady Foley is a suffused salmon variety, with dark centre very distinct. Delicatis-

sima (improved), exceedingly delicate blush, edged with pink or rose, and flowers large. Duchess of Westminster, of last year, is a very fine variety; the centre is nearly white, with a good band of rose. Leah (improved); this a golden-yellow variety, much larger and a deeper colour than that of the same name raised two years ago. Sir Thos. Payne is a good deep glowing crimson, of exceptionally good habit. A fine golden-bronze variety is that of Miss E. F. Backlaws, the foliage of which is also prettily marked.

Leviathan, brought out three years ago, is the largest of any of the single-flowered kinds. Its flowers are rose-coloured, and its habit very strong. Lady Whitehead, introduced last year, had large spikes, carrying five or six flowers of a charming rose colour, with blush centre; it is a very strong grower. Lady Pigott is a new and a first-rate free-flowering variety; flowers are a beautiful shade of salmon. Duchess of Leinster is also a new variety, and very strong growing; its flowers are a beautiful orange colour, and the plant is exceedingly striking. Mr. E. G. Hill, a salmon-rose of last year, is a dwarf grower of remarkably good habit. Darkest Africa, as its name would suggest, is the darkest-coloured flower yet obtained. Mrs. Blundell Maple is a fine bronze-orange, of exceptional merit and beauty.

There are, of course, a great number of seedlings that have not yet received any name by which they can be known, but which are quite deserving of such, and are only awaiting the firm's opportunity of dealing with them. One of the prettiest was a strong-growing variety of a charming blush-pink or flesh-colour. Another was a rosy-pink flower of enormous size and good habit, and a third had large primrose-yellow coloured flowers, likewise of good habit.

There are also some double varieties that from their pendulous habit, are especially suitable for baskets, the best perhaps of which are Alice Manning, primrose-yellow; Richardson's Favourite, crimson-scarlet; and Alba Rosea, a rosy-pink variety with white centre.

Messrs. Laing have almost finished planting for their summer and autumn display outside, where upwards of 300,000 plants are used, and where one of the finest sights to be seen, may be witnessed during August and September, when anyone who may go to see them will feel amply repaid.

ROSES AT CROYDON.

"MULTUM in parvo!" might well be inscribed upon the entrance to Mr. C. J. Grahame's beautiful Surrey garden, the owner of which fought so successfully the battle of the small men with the National Rose Society. It is not, as might be imagined, a garden of Roses alone, for, like all true gardeners, Mr. Grahame is not a "one plant" worshipper, but is catholic in his horticultural tastes. Although the place is of small extent, a great deal of pleasure is obtained from it at almost all seasons. Beginning with Snowdrops, Chionodoxas, Scillas, and Daffodils, and going on to May-flowering Tulips and Irises, then Roses, followed by Lilies (and what vigorous clumps of these he has!), Delphiniums, Anemone japonica, Harpaliums, and a multiplicity of other plants, and all of which are well attended to.

On June 25, some of Mr. Grahame's Roses were in splendid condition, especially the varieties A. K. Williams and Edith Gifford, and fit for exhibition were the following:—Gustave Piganeau, Margaret Dickson, La France, Dupuy Jamain, Prince Camille de Rohan, Grace Darling, Marie Baumann, Charles Lefebvre, Mrs. George Dickson, Victor Hugo, Duke of Wellington, Gabrielle Luizet, Heinrich Schultzeiss, Marie van Houtte, Anna Olivier, and Madame Hoste; so that it will be perceived Mr. Grahame could have put up an eighteen box on June 25, although it is called a late season in most places.

I noticed in his front garden a very fine bush of Rose Blairii No. 2, literally laden with its blush-pink very large and double flowers, some 200 of which were on view, to arrest the warm admiration of

passers by. I gleaned one or two little interesting facts from Mr. Grahame anent this old favourite that may be worthy of putting on record. For growing of this Rose, the information may not be thrown away by stating the fact that it will not stand anything but light-pruning, otherwise it will not bloom.

A singular fact I noticed (as exemplified in this particular tree) is, that the Briar grows equally with the rose, both developing unusual size. Because so little pruning is necessary with this variety, it makes a fine pillar or climbing Rose. *J. B.*

NEW EXHIBITS IN THE KEW MUSEUMS.

AMONG the most important of recent additions to the Museum of the Royal Gardens, Kew, is a very fine collection, illustrating the very varied uses of Bamboos in Japan. This interesting collection, which has been presented by Mr. Charles Holme, F.L.S., who got it together during a residence in Japan, has been arranged in special cases in Museum No. 3, where it will no doubt prove a source of great attraction during the summer. Comparing the uses of Bamboo in Japan with those of other countries—as, for instance, India, Burma, and China—Mr. Holmes says these uses are in divers respects more limited in Japan than in some other countries. Unlike the people of India and Burma, the Japanese do not build houses of Bamboo, neither do they make bridges, nor boats with sails complete, as do the people of Formosa; nor chairs, nor couches, and paper, as the Chinese do. This is explained by reason of the abundance of excellent timber in Japan, which is admirably adapted for constructive work; besides which, the industrial arts have attained in Japan a much higher degree of perfection than in many other places where the Bamboo is largely used. "Taken together, these facts will account for the absence in Japan of many applications of this material that are found elsewhere; at the same time also they account for many clever adaptations of the material which an intelligent people only could have devised. When used by them, although in some instances its cheapness is its main recommendation, it is generally because the material is the very best that could be secured for the purpose."

As might be expected, in the collection now at Kew, baskets in their very numerous forms are specially apparent, and in this connection Mr. Holme says there is probably no finer basket-work made in the world than the Bamboo-work of Japan, and he suggests that English basket-makers might study with advantage some of the ancient examples of Japanese-work. Among baskets represented in the collection may be mentioned a fish-seller's basket with a hollowed lid, upon which the fish is dressed. A basket used by shopkeepers for holding copper coins, a basket for carrying dirty pots to the kitchen, market baskets, charcoal basket, which answers the purpose of a coal-scuttle; baskets in which gifts of flowers, fish, and other articles of food, are sent.

Amongst the most interesting of other objects may be mentioned a bundle of tally-sticks, which are used in the following manner:—When a number of packages of goods are being delivered at a warehouse, a man stands at the door, and gives a stick to the coolies for every package they carry in. The coolies hand these sticks to another man in the warehouse. This man has a box before him having ten compartments, each of which holds ten of the tally-sticks. When the box is full of sticks, he knows that 100 packages have been delivered.

An ingenious contrivance is a scarecrow, which consists of a piece of flat wood, about 8 inches long, and 6 inches wide, upon which pieces of hollow bamboo are loosely strung. A post is placed firmly in the ground, and a cord is tied to the top of it; the cord is fastened at intervals to other posts, which are not fixed in the ground but only stand upon it. Upon the cord between the posts the scarecrow is hung; the other end of the cord is held by a boy who pulls it at intervals, which sets the cord swaying to and fro, and the Bamboos rattling against the boards effectually alarm the birds.

Besides these more practical applications, are many illustrations of a more artistic nature, including a beautiful piece of workmanship in the shape of a small medicine-box, veneered with a very thin coating of bamboo, and finished off with remarkable accuracy of detail. These are but a few items of a very varied and interesting collection.

Another collection of a different character, but withal of an instructive nature, consists of a set of implements, &c., such as are used at Singapore in the preparation of Gambier or *Terra japonica* from the twigs of *Uncaria Gambir*. The implements are those that are in actual use, such as a knife for cutting the Gambier plant in the field, a chopper for chopping up twigs and leaves of the plant before putting them into the boiler, a basket for carrying the freshly-cut Gambier leaves to the factory, a rubbish basket for taking away the spent leaves to the pepper plantations or Gambier fields for manure. One of the most remarkable instruments in the collection is a long wooden five-pronged fork, the prongs being arranged in a cylindrical fashion, and not laterally as in an ordinary fork. This unwieldy instrument is cut out of a solid piece of the hard wood of *Hoteia sideroxylin*. During the process of boiling, the Gambier leaves are incessantly prodded and stirred with this heavy instrument, the wielding of which is said to be the heaviest work in connection with Gambier manufacture. Another interesting implement, is a long thin-pronged curved fork, made of the same hard wood, and used to remove the spent leaves from the boiling Gambier, when it becomes thick or syrupy, when it is poured into a tub and stirred or rather churned with a piece of wood of the Mahang (*Macaranga hypoleuca*). In this tub (one of which is in the collection at Kew) the Gambier sets, after which it is cut into cubes or squares, and carefully dried, when it is ready for exportation.

A model of a Gambier factory completes the set in the Kew Museum, which fully illustrates the crude manner of the manufacture of this important tanning substance. *John R. Jackson, Kew.*

A MORPHOPHALLUS CAMPANULATUS.

SOME plants of this singular East Indian Aroid are now in flower at the Edgbaston Botanic Gardens, Birmingham, and are objects of much curiosity with their quaint spathe of an inverted bell shape, with the clapper-like spadix rising from the centre, and rising about 6 inches high from the roots. The flowers, only one upon each plant, is about 6 inches in diameter, and of a deep chocolate colour, and giving out at times an unpleasant odour which is apparent throughout the house. Another striking Aroid, *Godwinia gigas*, is growing in the tank-house, with a strong thick stem fully 6 feet in height, and beautifully marked, and is just now forming new foliage at the top.

In the same house a not often seen stove climber, *Stigmaphyllon ciliatum*, with its bright yellow flowers is now in bloom. A large specimen of *Anthurium Brownii*, a tall-growing kind with long footstalks and large bold foliage, is now in bloom, but the flowers are very uninteresting.

Some fine specimens of the night-blooming Cactus trained to the roof of an intermediate house, have also been objects of interest whilst blooming, from the peculiarity of the blooms opening in the evening. Two kinds have flowered, viz.:—*Cereus grandiflorus*, and *C. M'Donaldæ*. In one of the conservatories, several plants of the very pretty double *Azalea rosiflora* are in full bloom, yet how seldom it is seen. Probably this arises from the fact of its being a small-growing kind, and does not soon make good plants from cuttings, but as seen at the Edgbaston Gardens it is a charming decorative plant, abundantly laden with light salmon-red flowers; and blooms so late, after all the other kinds are out of flower.

Out-of-doors, in what is the herbaceous nursery, two large beds of *Mimulus cupreus* are masses of bright brownish-scarlet flowers, and very lovely

they are, having stood out all the winter, and the position is rather a low one in the gardens, and not far from a large pool. *W. D.*

COLONIAL NOTES.

THE BOTANIC GARDENS, HONG KONG.

THE following letter was addressed by the writer to an old colleague in the Royal Gardens, Kew, and obligingly handed to us for publication:—

"Having been more than three months in Hong Kong, I am sending you my first impressions, and some few particulars about the place. Although the island is within the tropics, the vegetation is anything but luxuriant. This is to be accounted for by the poorness and shallowness of the soil, which in many places is not more than 1 foot or so thick, resting on solid granite. Tree planting has been carried on very extensively, and considering the conditions under which they have to grow, the trees have done remarkably well. The island must at one time have had a very barren appearance. Of course there are no trees here now which can compare with the Oaks and Beeches at home, a tree 50 feet high is considered to be a big one. *Ficus retusa* is principally grown for planting along roadsides, and *Pinus sinensis* [the original *P. Massoniana*, Ed.] for planting on the hills. When rambling over the hills in February, I came across *Spathoglottis Fortunei* and *Phaius grandifolius*. The former was without leaves but in flower, and was growing where it would be saturated with water in the summer time. The latter was growing beside a stream, and was throwing up some immense spikes of flowers, although the leaves were in a most ragged condition.

"*Drosera Loureiri* is very common in bogs, and it is a very pretty plant, much resembling *spatulata*. *Gleichenia dichotoma* is found all over the island, sometimes in the full sun, and at other times growing where nothing else will grow in dense shade. Those plants that get partial shade do by far the best. *Gleichenia excelsa*, much less common than the preceding species, has a most imposing appearance when seen clothing some steep hillside with its long pendulous fronds.

I ought to say a word or two about some of the plants in the Botanic Gardens. *Renanthera coccinea*, that stubborn thing to flower at home, flowers here with the greatest freedom. We have a lot in pots, and every piece that is 2 feet long is sending out a strong, healthy panicle of flowers. They are grown in the full sun, and during the winter get no water whatever, except an occasional shower or two. *Phalaenopsis grandiflora* does remarkably well on the aerial roots of a large *Ficus retusa*. There are several plants in flower now, but unlike those at Kew in flower at the same time, they will be unaffected with the fog. *Vanda concolor*, with blossoms of a dirty brown colour, grows and flowers freely with us, on various trees in the gardens. I remember there was a small plant at Kew, but I never saw it in flower there. The collection of Orchids is not large, the principal genera being *Dendrobium*, *Vanda*, and *Eria*. There are only six South American species in the garden, and five of those I brought out from Kew. *Aristolochia Westlandii* is now flowering, but although it produced hundreds of buds, it has only brought six to maturity, notwithstanding that the plant is in robust health. English vegetables are grown from October to March; after the latter month it is too warm for them. It is very amusing at first to see the Chinese coolies digging with bare feet. Of course, the skin of the sole is quite leathery, as they never wear foot-gear of any kind. The climate is not at all bad so far—very much like that of an English summer, but without the rain. There are numbers of people who have been out here for ten and twelve years, and are as well as ever. From what I have heard, whiskey will do more harm in one year than the climate will do in ten. The place is well drained, and we have the electric light in the principal streets, so that it does not look altogether

uncivilised, and, judged by my experience during the last three months, Hong Kong is a very decent place to live in." *W. J. Tutchter.*

NEW ZEALAND.—IPOMOPSIS ELEGANS PICTA.

This is a gem I had from Benary, of Erfurt, and although marked as a biennial it flowered with me the first year from seed. Its deeply-cut, Fennel-like foliage is very striking, with its pink *Bouvardia*-like flowers. But why the specific name *picata* is added, I could not tell, until I examined it with a somewhat powerful glass; then, like all flowers, its additional charms came out. Indeed, all true lovers of flowers should avail themselves of one of these instruments. I have also succeeded, after many attempts from English seed, which proved futile, in getting seed to germinate from the same firm, of that spring gem, *Adonis vernalis*. A dwarf variety of this *Ipomopsis* would be a great acquisition. Will any of your correspondents kindly inform me where I could get a little seed of *Primula imperialis* and *Ramondia pyrenaica*? *T. Smith, Seedsman, &c., Timaru, N.Z.*

SINGAPORE.—PARA RUBBER.

Mr. Ridley remarks in the annual report of the Sincapor Botanic Garden, 1891, that no fewer than 8 acres of this tree, *Hevea brasiliensis*, have been planted at Sumbawang, that the trees are thriving, and the produce so good in quality as to render it desirable to plant it very extensively. More seed is, therefore, urgently required. Fast as the tree grows, it will be ten years before it is at best stage for tapping.

JAMAICA.

The last number of the *Bulletin* of the Botanical Department contains articles on diseases in Bananas caused by fungi, eel-worms, &c. A disease in Coconuts has been stayed by the simple expedient of burning the foliage.

CEYLON.

Dr. Trimen reports in his last report on the Botanic Gardens of that island, an increase in the export of tea for the year 1891, amounting to no less than 2½ million of pounds! Coffee cultivation has, Dr. Trimen thinks, been too hastily abandoned. The export of *Cinchona* fell to the extent of over three million pounds. "The history of *Cinchona* culture in Ceylon—a most interesting and instructive one—is drawing to its close; the future of the industry belongs to Java, which has followed wiser counsels and knows how to wait." The export of Cacao is increasing. Progress is being made with the propagation and distribution of the various Indian rubber trees. Dr. Trimen's report is unusually interesting, and bears striking testimony to the utility of botanical establishments in our several colonies.

THE ROYAL SCOTTISH ARBORICULTURAL SOCIETY.

THIS Society represents an art and industry of great significance, viz., the proper planting and management of timber trees, and ornamental plants and shrubs.

I need not state that the judicious and scientific knowledge of such industry embraces important details. This Society has been in active operation for twenty years, and continues to be supported with much energy and talent. No effort is spared to visit annually some of the largest tracts of forest plantations in Scotland, in addition to the most famed collections of rare and ornamental *Coniferæ* and shrubs. These inspections are great object lessons, and conduce to improve and enlarge our thoughts as to the character of our more recently-introduced varieties, and to form conclusions as to the class of plants best adapted for profit and adornment.

But while our foresters are thereby acquiring a higher culture, are they finding a corresponding outlet for their improved knowledge and abilities? Are our proprietors engaged in planting to such an extent as to occupy them fully, and give scope for their acquirements in actual practice? Forestry is not only a theoretical study, but more particularly a practical pursuit.

It is to be lamented that, while arboriculture is diligently studied, there is a growing indifference year by year to extend our woods. In every county there are thousands of acres unfit for cultivation, and miles of naked hills and mountains so prevalent in Scotland, and which might be converted into purposes of utility. In this county more than one-half is unsuited for crops and pasture, viz., 150,000 acres, and yet there are only about 5000 acres of woods, including coppice. It is a well-ascertained fact that the extent of young plantations is yearly falling off. During a period of sixty years there was a falling off of 179,000 acres in Scotland, while the total forest area is 730,000 acres.

It is essential to have an abundant supply of home-grown timber. Our demands are largely increasing, with the reflection that the area being planted is yearly getting less. We have serious prospects to encounter—the increased demand for native timber, with the diminution in its supply. Let me do the justice of stating that such falling off is not because our proprietors are unwilling to engage in forest-planting. The ordinary drawbacks arise prominently to the mind of every proprietor when contemplating the undertaking of extensive plantations. Fences are expensive, conveyance of men and trees are difficult; the heavy outlays become an investment of years, with the remote prospect [of the planter] ever receiving any returns. However public-spirited, wealthy, and desirous many of our proprietors may be to embark upon extensive schemes of afforesting, yet the serious difficulties of the first outlays block the way. It is apparent if the obstacle of the original expenditure could be overcome, a much greater breadth of land would be planted. The maintenance of an abundant supply of home-grown timber is not of personal but national importance. This is not simply a proprietor's question, but is surrounded with considerations of weighty and national moment, and must demand immediate and special legislation. The legislation of the present day has outgrown the stereotyped limits of statutes and enactments, and whenever a condition of circumstances arise in any district or among a large section of the community which was unforeseen and unavoidable, and which private efforts or outlays cannot overtake, the Government is ready to combat these public emergencies. For instance, the Highland crofters are offered harbours, railways, roads, boats, &c., to meet their present requirements, and during six months from 8,000 to 14,000 hands had constant employment in Ireland on the recent Irish Relief Works, and the Construction of Railway Works at Government Cost and Inspection. In the case of the distress of 1880, a loan of two millions at 1 per cent. was granted to Ireland. These means of assistance, while tiding over present emergencies, conferred general and lasting benefits to all classes. Recently £2000 was granted to the three counties, Dumfries, Kircudbright, and Wigtonshire, to instruct their farmers as to the best modes of making their cheese and butter.

The financial position of the imperial exchequer has become so good, they can scarcely determine how to allocate the huge surpluses that yearly accumulate, from which surplus a free education is granted to every family in England and Scotland, and with large balances remaining, it is proposed to pay one-half of all the parochial and other local rates in Scotland, so that what were strictly private duties have been recognised as national burdens and responsibilities.

I maintain that the ambition and function of our Scottish Arboricultural Society is not strictly to acquire a sound knowledge of the art of forestry, but more particularly to hasten on and develop the raising up of greater quantities of home timber. This I consider can only be accomplished upon the now universally recognised principle that it will satisfy public requirements by granting Government advances to all landed proprietors to improve their waste lands, and cover our bare hills and unproductive land with trees for use and ornament, and which if neglected will result in national misfortune. I

think an influential movement in this direction should be originated by the Royal Arboricultural Society. *Garlies Mitchell, Stranraer, Wigtonshire.*

SCOTLAND.

EDINBURGH CITY GARDENS.

It is generally admitted that no city in Britain has finer gardens than Edinburgh (of course this does not mean parks, which are generally large suburban gardens), and we think they are never so beautiful as during the "leafy month of June." Princes Street and Queen Street Gardens are just clothed in their richest verdure. The trees of various shades have not as yet become disfigured with soot, and the spacious lawns are at their best; and though the late showery weather has created extra labour in keeping the grass sward, yet such is in favour of appearances? The flowering season, although so short for ordinary bedding plants, is giving complete satisfaction, still I should be much

REV. H. H. D'OMBRAIN.
Hon. Secretary, National Rose Society.

better pleased, were I a citizen of Edinburgh, to see the beds in the low grounds dispensed with, only turf taking their places, which has a beauty of its own which no bedding can out-rival. We have been always accustomed to admire the grass when not interrupted by patches of mould, or shrubs and trees placed about on it like sentinels; and it must be admitted that the gardens indicated are vastly superior in this respect (by the surface disfigurements being absent) to most other city gardens; and no one has a keener sense of this than the talented and popular superintendent, Mr. McLeod. It is often stated that this tree and the other should be introduced; but of course those who would improve matters in this direction have a very remote idea of the difference of trees in the fresh country air and those struggling in smoke and dust. So it is that the city planters have a limited choice of trees and shrubs. In London we have had the making of and superintendence of numerous squares (or rather the gardens enclosed in them), and know no town so difficult to deal with. Yet the Planes and a few other species have developed remarkably, and the everlast-

ing Privet struggles on under the use of the shears for a long time. Those who have charge of such places under these untoward circumstances, learn by experience what to plant and how to treat them afterwards. We have seen in Chelsea some of the finest Apples ever grown in this country, and young trees remain always vigorous and healthy. On the south side of a large house off St. Paul's Churchyard, we have seen the best outdoor Vines, which grew with vigour. It is proved that trees with smooth glistening bark and foliage of bright glossy-like surface stand the smoke and dust best. There is one shrub which seems to thrive everywhere, and grown very extensively in the Princes Street gardens (the Golden Elder), and does good service with its fine golden foliage when well interspersed with dark foliaged shrubs or trees. This shrub grows to great size in one season when soil is deep and rich; but then, under these conditions, its colour is very imperfect. It can be cut down annually, and kept always about the same size, and may be kept dwarf by lifting, cutting off strong roots, and replanting in poor but firm soil in the full sun; on soil sharp, but not rich, it becomes as yellow a golden feather, like the most useful and hardy *Aucuba maculata* (old *A. japonica* of gardens). The Golden Elder may be over-planted (and I sometimes think we have erred more than once in this way), but a town gardener is glad to get plants of this class; and no doubt the useful and free-growing Elder has come in as a useful adjunct to help the Shrubberies in Princes Street Gardens. The long bank of Ivy in the west end division of these gardens, is a beautiful feature, growing where one would have much difficulty in keeping grass alive. At this season the great breadth of Ivy is a picture of itself, the delicate young foliage contrasting beautifully with the trees dotted in it. Perhaps, if there were fewer trees in the line at top of Ivy border, the beauty of the space beyond would be greatly enhanced. I have had much to do with Ivies, but mostly on old walls or ruins; and I have always managed to keep it close by an annual clipping. Ivy does not only fall from walls when let alone, but when not clipped it forms a complete harbour for rats, birds, and other vermin. *M. T.*

GOLDEN ACRES NURSERIES, EDINBURGH.

These nurseries have justly been famed for some years, and it would appear that Mr. Thomson, the proprietor of them, seems to leave nothing undone to maintain their good name by moving with the times, and growing in great abundance such plants as are in great request, and making selections of the best, and increasing their numbers as rapidly as possible, so that there may be no shortcoming. Mere collections having had their day, plants of hardy constitution, with good general appearance, meet the wishes of those who purchase them. For example, long beds of *Dracæna terminalis amabilis*, and *D. terminalis alba*, or others raised from these hardy and beautiful species, may be seen in the best of health, and as near to perfection in colour as I ever saw *Dracænas*. Many others are very fine in appearance, viz., *Miss Glendenning*, which is a variety that is conspicuous for fine colour, and all are in great variety. *Crotons*, too, are of extra fine colour, and grown by the houseful. *Crotona Prince of Wales*, *Countess Aigburthensis*, and *Warrenii*, seemed to be the varieties most distinct in colour, among large numbers of the best-known sorts. *Aspidistras* are grown by the thousand. This is the plant above all others which is highly valued for rooms; it is difficult to kill it, and is sometimes used in large numbers to decorate coasting and passenger steam-vessels, and I am assured that no plant stands the salt spray like it. The foliage is thinned out in quantity for mixing with cut flowers.

Eucharis in boxes, pans, and pots, on shelves, under stages, and in every nook where they could be stored, give indication of the immense demand for these popular plants. *Caladiums* were a very attractive group, and the new forms, which we admired greatly, were conspicuous for their beautiful bronzy foliage, which is very luxuriant. *La Lorraine* seemed to receive special favour, so did Mrs.

Harry Veitch, a bronze crimson; Madame Mitjana, bronze; Princess Teck, Duchess de Montema, Gerard Dods, Léon Say, Madame Imbert Kaddine, Ibis rose, Madame Alfred Maure, all mostly of a bronze and golden hue, and very striking; these were set apart as some of the cream of the stock. Raymond Lemonnier, not yet very plentiful, is a very choice variety. Begonia Arthur Malet was one of the finest in the foliage class. Myriads of Ferns and Palms are grown—whole housefuls may be seen; panfuls of young Ferns in every available space were ready to be potted, which shows no decrease in the demand for these valuable classes of plants. Azaleas of the early forcing class were to be seen in housefuls. There are now many fine double whites of this class, but Duchesse de Perle still holds its own; many varieties of rose and crimson-coloured sorts are now grown in immense numbers for winter use, and are most valuable between the months of November and April. India-rubbers, green and variegated, are as popular as ever—indeed, the immense demand for the variegated form renders it yet somewhat scarce. We have used it for room decoration for some years, and look upon it as one of the best plants for this purpose which has been introduced of late years; they are also receiving much attention at Golden Acres. These are a few of the specialties at this nursery, and we never saw the plants there cleaner and in better health. One other item in this plant emporium is the excellent collection of Vines in pots, strong fruiters, fully developed, short-jointed wood, very strong, and immense healthy foliage, constitutes a well-grown Vine, either for fruiting in pots, or for planting out. The canes referred to are already stopped to the length they are to be kept at, thus plumping up the buds from top to bottom. The long rest these Vines will have, and the abundance of time they have to ripen and retain their fine foliage, is the perfection of Vine-growing. *M. T.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

LAYERING STRAWBERRIES.—If intended for fruiting next year, the runners should be layered as early as possible this season, and when they are sufficiently rooted to take care of themselves, sever them from the old plants, transplant them firmly in the open, and cut off all runners. Under this treatment the plants will make good strong crowns, that will bear fine crops of large fruit next year. I always layer a given number for early fruits, fruiting the plants once, then destroying them. Noble is good for this work, but the flavour is wanting. [Grow something better. *Ed.*] Layer the runners in 3-inch pots, three-parts filled with good soil; stand the pots level around the plants, and peg from each from six to nine, according to strength, and water when necessary; and in about a month the runners will be in a good condition for transferring to their allotted quarters. If planted at 18 inches apart on a south border, and treated in the above manner, a first-rate supply of early fruits will be obtained, which will be ripe a few days before those on older plants. The ground for this early crop does not need the same amount of preparation as permanent beds, which should always be trenched and heavily manured some good time before planting, so that the soil may settle, the plants delighting in a deep firm soil in a good heart.

EARLY-RIPENING PEACHES AND NECTARINES.—The fruits of these should receive their final thinning and the sublateral and useless shoot-wood be cut out, and the foliage cleaned with the syringe or engine. The varieties Waterloo, Alexander, and Amsden will be the first to ripen, being followed by Hale's Early, Early York, and Early Louise. If fine fruit is looked for, the trees must not be heavily cropped, or the roots lack water. It will be found advisable to afford them two good soakings of manure-water. All leaves which overhang any of the fruits must be put aside, and if the trees are robust some of these may be shortened or cut off so as to expose the fruit. These early varieties should always be gathered a

few days before they are ripe, taking care not to bruise them, and place them in an airy fruit-room, and resting on a layer of cotton wool over which a piece of tissue-paper should be laid. If the fruits of the above-mentioned Peaches are left on the trees till they are ripe, it is not an uncommon occurrence for fruits to crack open at the apex, making the pulp dry and of poor flavour. All the later ripening varieties will require to have their shoots regulated, and the sublaterals stopped, the foliage being kept quite clean by washings with the garden-engine. Should mildew put in appearance, dust the shoots and leaves when damp with flowers-of-sulphur, and mark the trees so attacked, and at the proper time lift the roots, and in the case of old trees, grub them out and plant others.

APRICOTS.—In the case of trees which have not been summer pruned, all the foreright and side shoots may now be shortened back to within four eyes of the base; and if this operation was previously performed, the still soft secondary shoots should be pinched back, the shoots laid in thinly. Keep a sharp outlook for shelled snails, or much of the fruit may get spoiled. After the trees have been put in order, clean them thoroughly with the engine. Keep the borders moist and on light dry soils; do not be chary with the use of manure water. The main branches of the Apricot should be somewhat shaded from the sun by means of young leaves and shoots over them, or if these are not numerous enough, some artificial means must be found for covering them.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

CLERODENDRON BALFOURIANUM.—Specimens which have ceased flowering should have their shoots cut well in, afterwards placing those which are in pots in a structure where a genial humid atmosphere is maintained, and where there is sufficient head-room, so that the young growths may be trained to their full length. After the plants have made shoots about 2 inches in length, turn them out of their pots, removing a portion of the old soil, and any straggling or long roots. Having done this, re-pot them in a compost consisting of three parts fibrous loam, taken from a rich pasture, and one of rotted stable manure, with sharp sand in quantity to keep the compost open. The pots should be clean, and contain a depth of 4 inches of drainage materials. Make the soil moderately firm around the old ball, and leave sufficient depth below the rim for efficient watering of the plants. After potting, the plants should be placed in such a position that strings can be placed above them and under the roof, to train the new shoots to. The length of these strings may be from 15 to 20 feet, as in the case of strong specimens, they will make growth of quite that length. When roof-space is limited, and space does not exist to train each shoot separately, two or three may be twined round the same string. From the period of cutting back the plants, the syringe should be in regular use to encourage growth, and keep insect enemies in check.

SHRUBBY VARIETIES OF CLERODENDRON.—Clerodendrons fallax and Kämpferi may be induced to flower a second or third time by removing the corymb as soon as it is past its best, the eyes just below the point of severance commencing to push into growth at once. These cutbacks, if well supplied with manure-water, will flower at the end of August and during September; whereas plants hard cut back after blooming, seldom have sufficient time to make flowering growths ere the season is too far advanced for fine heads of bloom to develop.

ERANTHEMUM PULCHELLUM.—Plants struck from cuttings this year, and grown on quickly with due attention paid to stopping the shoots, should be stout and bushy, occupying 5 or 6-inch pots, and when the pots are fairly well filled with roots, they should be shifted into pots two or three sizes larger. Cut back plants which did good service last year, if in vigorous health, may be afforded 12-inch pots. I find that these are the plants which are most suitable for early flowering. A compost consisting of three parts of rich fibrous loam, and one each of decayed manure and leaf-soil, with sand in proportion, will be found suitable for them. The plants should be grown in a low house, and where the temperature is not allowed to fall below 60° at night, with a corresponding rise by day.

STEPHANOTIS FLORIBUNDA.—Young plants which have become well rooted in their pots should now be moved into others two or three sizes larger, as, should they be allowed to get pot-bound whilst young, the growth of the plants would be greatly retarded. Large specimens which have done blooming should have the necessary pruning and thioning carried out as soon as possible, keeping them rather dry at the roots for a time. Those in beds, or tubs, or large pots, naturally grow more robust than those that are more limited for root-space, and will, in consequence, require to be cut harder back. If the drainage of the pots and tubs is good, the Stephanotis will thrive without needing to be disturbed for a number of years, and I find that when the pots are once filled with roots, and some weak stimulus is afforded them during the growing season, the plants flower with great profusion. Should mealy-bug infest the plants, examine the latter frequently, and use every effort to rid the plants of the insects.

CALLICARPA PURPUREA.—To have these plants in a forward state by the autumn, the young stock raised from cuttings or seed in the spring should be pushed on as soon as they are ready, stopping the leading shoots two or three times, so as to get them to throw out a number of side-shoots, as in general the plant is naturally thin in habit, and if it be allowed to grow on without stopping the leaders and laterals, it has a straggling appearance. Pots 7 or 8 inches in diameter, will be large enough for the final shift, affording the plants a compost consisting of two parts loam and one each of leaf-soil and decayed manure, with sufficient sharp sand. Grow the plants near the glass in the intermediate-house, throwing a light shade over them when the sun is bright. Old plants which have been cut back and made new growth, if vigorous, may be repotted in pots of two sizes larger, pinching back any shoots that may be taking an undue lead. Syringe the plants overhead every afternoon, and assist them with weak manure-water when the roots have filled the pots.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

SUMMER BEDDERS: CARPET BEDS.—Owing to the late tropical weather, which compelled us to water the beds copiously, the plants, notwithstanding the generally backward character of the season, promise to be as well-furnished at the end of the present month as in previous years. The work on the beds will consist of pegging-down the shoots, pinching and training into shape the various carpeting plants employed. The flowers of Sedums, Echeverias, golden Chickweed, Stellaria graminea aurea, Saxifrages, and plants of like habit of growth, should be picked off, and the centres of these species of plants pressed into the soil with the hand. Cut off with shears all growths that spoil the regularity of dividing lines of plants, as well as from the plants with which divisions are planted. *Ileriaria glabra*, *Antennaria tomentosa*, *Stellaria*, and *Cerastium tomentosum* and *arvense* are the plants most quickly trimmed into shape. Carpet-beds from this date to the middle or end of September should, however, be put into good order at least twice in about three weeks; and when they are well kept, these mosaic patterns, formed exclusively of dwarf foliage plants of bright, soft, and pleasing colours, contrast very effectively where the other beds consist of masses of scarlet, pink, white, yellow, and blue flowers.

THE LAWN.—The present is a good season for the destruction of large-leaved weeds on the turf, the grass growing quickly, and obliterating all trace of the bare spots where they grew. No better implement exists than Wilke's Dock and Daisy Eradicator; and although a calendar is scarcely the place for a recommendation of any implement, the usefulness of this one must be my excuse. It was described in these pages at p. 532, on April 23 last. Where verges of turf were not trimmed with the edging-iron at an earlier date, it is not too late to see to this matter at the present season, if it does not involve any laying of turf.

THE ORCHID HOUSES.

By H. A. BURBERRY, Orchid Grower, Highbury, Birmingham.

DENDROBES.—*Dendrobium Cambridgeanum* is rather an unsatisfactory *Dendrobe* to flower, and it should now be resting, which is best done by suspending it in the Mexican-house, affording it but little moisture at the roots. It flowers from the young pseudobulbs as soon as these are formed, in

early spring, but to get it to flower well, it appears to be necessary to starve the plant, even whilst it is growing, that is after the flowering is past. However, water should be freely supplied until the pseudo-bulbs are quite mature. Other Dendrobies are growing at this season, and should be afforded sufficient heat, light, and moisture, drought at the roots, or a dry atmosphere, being undesirable, and continue to make use of weak liquid manures, as recommended in former calendars. *Comporettia macroplectron* is an Orchid which should be grown in a small pan or basket, hung up in the Cattleya-house. *Masdevallias* may now be repotted; at least, all such as have finished flowering. The kind of peat employed for these plants need not be very fibrous, but it should be broken up into small pieces, and well mixed with chopped sphagnum moss, and some sharp sand and a small quantity of half-decayed leaf soil that has been rubbed through a fine sieve.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

LATE VINES.—Where the thinning was not sufficiently severe, some few more berries may be removed, as well as all superfluous growths, the latter by pinching with the finger and thumb. Feed the Vines according to their needs and the weight of the crop, but being more liberal with the use of manure in any form to those Vines that are planted in light airy houses having a command of artificial heat. When the Vines are weak or bearing a heavy crop, a humid atmosphere should be aimed at during sunny weather, frequently sprinkling the borders with diluted manure. A minimum temperature of 60° to 65° should be adhered to.

MELONS.—The latest succession of Melon plants may be planted about this time, after having cleaned Melon-houses or pits inside and out, not forgetting to limewash the inner walls. For late cropping, only the best-keeping varieties of Melons, and those which are not liable to split, should be planted. When the new plantation is intended to replace another in the same house, the old soil must be thrown out. The fresh soil will be the better for the plants in proportion to the amount of superphosphate it contains, as the production of flowers is thereby fostered. In planting and watering, previous instructions should be followed. Melons now in flower should be kept, as regards the soil, rather on the dry side till a sufficient number of fruits have set, and then liquid manure should be afforded the plants, and additional rich compost put on the borders and mounds. Do not water with cold water, but always with that which has been well-warmed. Ripening Melons may be afforded a dryer atmosphere than those in a less forward stage, and a small amount of air admitted by the top ventilators day and night, which will improve the flavour of the fruit, and prevent it cracking, to a certain extent. The soil around the roots of the plants should not be allowed to get into a dry state, or the fruits will lack juiciness and tenderness. Thrips often make their appearance in Melon-houses during the summer months, and, if left unchecked, they make havoc with the foliage. No better means for its extermination has come under my notice than that of fumigating with medicated tobacco-paper. Red-spider can be kept in check by syringing the plants for several consecutive nights with tepid water containing a small portion of soft-soap, and ventilating early the following mornings; in fact, if the weather is favourable, air may be left on the whole night.

STRAWBERRIES.—Runners for pot-work ought now to be pegged down in pots or on ridges of prepared soil. In this way, well-rooted plants will be obtained by the end of the present month. The runners must not want for water in dry weather; and they should be potted up as soon as ready.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

CELERY.—The planting of the main-crop plants should not be delayed any longer. For the earliest and main crops of Celery more manure may be used, whilst late crops should not be afforded much manure, or the plants will suffer greatly from frost; indeed, I question if an excess of manures is not the cause of Celery running and decaying generally. It would appear that it is safest to assist growth with farmyard liquid, fish manure, and common salt, if the soil be light. Plenty of water is necessary during the summer for the plants in all stages. In lifting the plants for planting them out, get a ball of earth,

with all the roots that belong to the plant; trim off the lowest leaves and offsets, and make the holes sufficiently large to take the ball without crushing it. Make the soil firm about it, and afford a thorough watering at the finish. For late and main crops, the seed should be sown thinly in cold frames, and the plants transplanted to the trenches direct, thereby in great measure averting bolting.

CABBAGES.—For securing heads next April and May the present is a suitable time, for late or cold districts, to sow for the earliest cuttings; but it is not advisable to fix one date for all parts of the country. If seed be sown from July 15 to 20, on a border not exposed to the sun the whole day, and sown thinly, it will be sufficiently early. Seeds may be sown again ten days or a fortnight later, so that, if doubt exists as to the first lot becoming too large to stand the rigours of winter without loss, this second lot will be of the right stamp. Pricked-out Cabbages, if there is time for this kind of work, bring good results, the plants growing sturdy and short-legged, and, in consequence, suffering less from frost, and do not bolt much. One of the best Cabbages for early spring consumption is Ellam's Dwarf Spring, a small-growing variety that may be planted at 18 inches from row to row, and half that distance in the row. To follow this, our Nonpareil is a capital Cabbage, very hardy, and a compact grower. A small quantity of seed of the Red Dutch should be sown, if pickling Cabbages are required.

BRUSSELS SPROUTS.—A later lot of this useful vegetable should be planted out from the open seed beds, and these will form a succession to the earlier planting, affording a supply of small hard Sprouts, and standing severe weather better than the earlier and better-developed plants.

BROCCOLI.—A sowing of Walcheren Broccoli, made at the same time as the Cabbage, will be found serviceable in the spring, these plants often standing a severe winter uninjured, and affording nice heads after the earlier-planted Broccoli is over; indeed, I prefer this variety to the Cauliflower for winter sowing.

GARLICS AND SHALLOTS, ETC.—The bulbs of these two plants should be taken up and dried, and stored in a cool shed. Pot herbs may now be cut and dried. The beds of spring-sown Onions should be gone over, and the necks of thick-growing ones bent over, and Tripolis taken up and stored in a cool place for present use.

FORESTRY.

By J. B. WEBSTER, Fairview, Stangmore, Dungeness.

CLEANING YOUNG WOODLAND.—The recent and present genial weather has been and is favourable for tree and shrub growth, and weeds and surface scrub are not one whit behind those; consequently recently-planted young trees are becoming smothered with first-named and grasses. When such is the state of the ground, the vegetation must be cut down, to afford the plants breathing space, or fine growth can scarcely be expected. A careful man with a squad of boys may perform this task in a satisfactory manner at a cheap rate of pay. Young ornamental trees, planted sparingly in the young wood, should not only be kept free of weeds, but the hardened surface occasionally broken up with the hoe and the rake, an operation which is very beneficial to them in assisting healthy development. Examine the ties of all trees which are secured to stakes, and such as are getting tight should be loosened a little to save the bark from injury, and the flow of sap from being checked. All branches and twigs that may have been used to shade and shelter young ornamental stuff may be removed, there being no danger to be apprehended from frost at this season. Young ornamental plantations should be kept free of weeds by means of the hoe and rake; and young hedges of all kinds in particular kept clear of weeds, on no account letting weeds shed their seeds; and as some species of plants are capable of maturing and perfecting seed after being pulled up and left to lay on the surface, they should be gathered up and consigned to the rot-heap forthwith. As sheep and cattle are now at large in parks and fields, fences and tree-guards of all kinds should have particular attention at this season, to prevent them from entering and browsing on the branches and twigs. During dry weather, fences, tree-guards, and gates should be painted, also wooden sheds should be repaired where necessary, and the roofs and sides coated with tar. Barrows, wooden and other kinds of carts should be put into thorough repair.

This is the best season for repairing hill-roads, bridle-paths, bridges, and embankments that have been undermined and damaged by the winter floods, making them safe for pedestrians by the time they will be traversed by shooting parties in the month of August. For the binding of loose sand and similar material along the banks of mountain streams and roads, &c., sow the seed of some of the hardy grasses with creeping roots, such as soft grass, *Holcus mollis*, *H. lanatus*, Lyme-grass or Sand-grass, *Elymus arenarius*, Sea-reed or Mat-grass, *Ammophila arundinacea*, Couch-grass, *Triticum repens*, all of which are perennial and well furnished with deep creeping roots, and highly suitable for the purposes named. In parts of the country where tough sods can be had, these may be used here and there, for similar purposes, and to bind the loose material and prevent it from being washed away by rain until such time as the sown grasses become established. Fragments of wood that cannot be utilised to better account should be cut up for fire-wood, and the making of charcoal; the former should be cut into suitable lengths as may be required and built into stacks in an open airy place so that it may be thoroughly seasoned by winter. The stuff for making charcoal may be cut into lengths of about 2 feet long, and about 4 inches square, but branches of a much smaller size are also suitable.

THE APIARY.

By EXPERT.

REARING QUEENS.—About the middle of the month of July is the best time at which queens for the next year's work may be reared. There are usually one or two stocks in every apiary which get ahead of the others, although the conditions at the commencement of the season seemed about equal. These are the workers, which ought to be perpetuated, and much might be done by careful selection in improving our bees, so as to get a strain that could be depended on as being good honey-gatherers, non-swarmers, and quiet in disposition. The drones exercise a great influence on the progeny, and must be taken into account; but, although we cannot control mating, the continual weeding out of the worst queens advances our object, and, in time, exercises a good effect by creating a preponderance of the drones required. The most irascible bees are generally hybrids, Ligurian or Carniolan, and these are therefore to be avoided. Now that the tide has turned in favour of the once-despised "blacks," drones of foreign races are getting to be more uncommon than was formerly the case, thus lessening or removing a serious obstacle. The stock intended for queen raising should be deprived of its queen, eggs, and larvae, and a frame, containing the latter from the selected hives, inserted. On the twelfth day the queen cells will be ready to cut out, and they must then be put in a queen nursery, or separately in match boxes, and kept in a warm place until the inmates bite their way out, when they should be immediately introduced to the desired stocks.

TECHNICAL INSTRUCTION.—Quite a new and novel method of imparting instruction in bee-keeping is being carried out in Herefordshire, a grant of £50 having been made by the County Council. A one-horse travelling sleeping van has been built to go round to the villages, and is fitted up so that the back can be let down to form a platform for the lecturer who accompanies it. A magic lantern, with suitable slides, is also carried, for use after dark. The screen is fitted on a roller at the end of the van, and when drawn down forms a back to the platform, the lantern, placed in the front, throwing a five-foot picture on to it. It is hoped that by this means people would be reached whom it would be next to impossible to get at otherwise, and it is not too much to expect that an improvement in keeping and managing bees will result, with benefit to those concerned.

SUPER CLEARERS.—Beekeepers who used the "Flood" pattern super clearers last season seem very well satisfied with the working of them, as they certainly have achieved the results claimed. The principal difficulty at present seems to be that as section crates vary in size so must the clearer, thus necessitating a number, whereas otherwise one would suffice for a good-sized apiary. It is not very easy to get bees out of sections by the old methods before they have pierced the cell coverings, and a super clearer with all section crates of the same dimensions will no doubt be looked upon in the future as a necessity in every well-managed apiary.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, JULY 12 { Royal Horticultural Society; all committees. Paper by Rev. E. Handley on "Orchids for a Cool Greenhouse."

WEDNESDAY, JULY 13—Royal Botanic Musical Promenade.

SHOWS.

TUESDAY, JULY 12 { Wolverhampton Horticultural (3 days), in conjunction with the National Pink, Midland Section. Hereford Horticultural and Rose Show.

{ Royal Horticultural Society, Drill Hall, Westminster: Show of Hardy Herbaceous Perennials.

{ Ealing Horticultural.

WEDNESDAY, JULY 13 { Bedford and Bedfordshire Horticultural. Tunbridge Wells Rose Show. Royal Caledonian Horticultural Society (2 days).

THURSDAY, JULY 14 { Helensburgh Horticultural and Rose Show. Harlestone Rose.

SATURDAY, JULY 16 { National Rose Society's Show at Chester.

SALE

FRIDAY, JULY 15 { Unreserved Sale of well-established Orchids from Mr. H. James, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°·3.

EVERYTHING wears a rosy complexion this week, except, perhaps, to disappointed electioneers; but true rosarians will attach little significance to such ephemeral and thoroughly unscientific and illogical matters as a contested election. The Rose exhibitions have been very good, and full of interest, as our reports will show. It is to be regretted that at Earl's Court some attempts were not made to break away from a system of exhibiting which, however necessary for purposes of critical comparison, goes as far to make the Rose ugly and generally uninteresting as it is possible to do. It is a pity that so fine an opportunity should have been lost. We must refer to our reports for an account of the Exhibitions, but in this place we avail ourselves of the opportunity of publishing a portrait of the Rev. H. H. D'OMBRAIN, to whose energy and loyalty rosarians owe so much (see p. 39). The National Rose Society and the Horticultural Club are striking object lessons, showing what a country parson can do in the way of advancing horticulture, and not even those successful institutions can make us forgetful of similar labours in the case of the Gladiolus and other florists' flowers. Natural history and botany secured a large share of his attention long ago at Trinity College,

Dublin; and, if we mistake not, Mr. D'OMBRAIN was one of the founders, and remains one of the few survivors, among the originators of the Natural History Society in that city. Among the tercentenary festivities, this fact seems worthy of record. Mr. D'OMBRAIN has also been a constant contributor to the horticultural press for many years, and we, too, have and do profit by his valued co-operation.

Inexorable limitations force us to hard-prune our rosy inclinations, but we may as well mention among the events of the week the publication of yet another book on the literature of the Rose, *La Rose dans l'antiquité et au moyen âge, histoire legendes et symbolisme*, par CHARLES JORET. Paris, EMILE BOUILLON. There seems to be no end to the demand for this sort of literature. The book before us travels over well-beaten tracks, but for all that it will be read with interest by scholars, dilettanti and connoisseurs as well as by the general reader.

UNIVERSITY TRICENTENARY CELEBRATIONS AT DUBLIN.—Trinity College, Dublin, was founded by a charter from the "Lion Queen" in 1591, and has just now been celebrating its existence and gathering strength during the past three centuries. On the opening day the Provost's daughter, Miss F. M. SALMON, planted a Mulberry tree as a memorial in the Fellows' garden, and turned the last sod with a silver spade, presented by the Senior Proctor, Dr. S. HAUGHTON, F.R.S. The Mulberry tree was especially selected for its well-known longevity as a town-garden tree, and also to keep up the time-honoured traditions of the place, since there still exists in the Provost's garden a Mulberry believed to have been planted very soon after its introduction about the year 1548. There were in attendance delegates and guests from the principal British, European, American and Oriental universities, and our readers will be glad to hear that Professor MICHAEL FOSTER, of Cambridge, was not only a specially invited guest, but that he received a Doctor of Science degree, and there was an enthusiastic reception as he stood forward to receive the honour. Amongst the guests especially invited was Mr. DYER, the Director of Kew, who unfortunately was unable to be present. The great Examination Hall of Trinity College was *en fite*, and the enthusiasm of visitors, guests, and graduates, rose to its height when ALMA TADEMA, HENRY IRVING, and Sir F. LEIGHTON stepped to the dais to accept the degree of Doctor of Letters. Altogether about seventy-two Honorary Degrees were conferred on men of world-wide reputation; the popular favourite of the students being Dr. IRVING, who was carried to the steps of the dining-hall, where he made a speech amid the wildest enthusiasm. Trinity College, Dublin, emulates the English universities in the keeping up of a well-stocked botanical garden (see p. 33), the curator of which stands tenth on its roll of Honorary M.A. degrees. Many years ago the Royal Society of England elected a gardener, the celebrated PHILLIP MILLER, of the old Chelsea Physic Garden, into its ranks, but so far as we know, Dublin is the only university in Europe that has conferred its honours on a member of our gentle craft.

CHICAGO EXHIBITION.—From California is to be exhibited at the World's Fair one of the famed huge redwood trees, or Sequoia sempervirens. The one selected is 300 feet high, and more than 30 feet in diameter at the base. A specially constructed train will be necessary to carry the monster across the continent. It is the intention to hallow the base into booths in which will be sold Californian wines, fruits, and curiosities made of polished redwood.

THE HORTICULTURAL COLLEGE, SWANLEY.—The diplomas and prizes gained by the scholars of the Swanley Horticultural College during the past session were distributed on Saturday. Mr. J. C.

JOHNSON presided. The ceremony of presenting the awards was performed by Mr. G. M. ARNOLD, C.A., the Mayor of Rochester, and chairman of the Kent County Council Technical Education Committee, who remarked that the Kent County Council had a special interest in the College, as they had made arrangements whereby twenty students, having gained scholarships in local examinations, should be instructed there.

TWO NEW NATURAL ORDERS.—Herr NIEDENZU, of Berlin, proposes in the *Natürlichen Pflanzenfamilien* of ENGLER and PRANTH the establishment of two new orders called respectively Blatticeæ and Panicactæ, the latter to include the Pomegranate, the former comprising Blattia, which is remotely allied to Napoleona and Crypteronia.

"ILLUSTRATIONES FLORÆ HISPANIÆ."—Among the plants figured and described by Dr. WILKOMM in the last number of his very accurate and trustworthy publication, are Euphorbia imbricaria, with deflexed overlapping leaves; Erysimum linifolium, with rose-coloured flowers; Centaurea cephalariifolia, with rosy-lilac flower-heads, showy enough for the herbaceous border; as also is the dwarf yellow-flowered Centaurea Toletiana.

THE DICTIONARY OF GARDENING.—A French translation, effected by M. MOTTET with the aid of specialists in various departments, of NICHOLSON'S *Dictionary*, is in course of publication (Paris, Librairie Agricole, Rue Jacob 26). The preparation of this French edition will allow of the expansion of the original, and the remedying of certain omissions. The work is so useful that we could wish the publisher would see his way to the issue of an annual supplement, and eventually of a new edition.

BARON TODARO.—We learn that this gentleman, the Professor of Botany and Director of the Botanic Garden, Palermo, died on April 18, and has been succeeded by Dr. HERMANN RAST. Baron TODARO was not only a botanist, but a lawyer, and a politician. He was known among botanists for his publications on the species of Cotton, species of Agave, Aloe, and other interesting plants from the Palermo garden, and was an occasional correspondent of this journal.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the committee of the above took place at Anderton's Hotel, Fleet Street, on Thursday, the 30th ult., Mr. R. BALLANTINE in the chair, and a large attendance of members and delegates from various affiliated societies. A letter was read from Sir EDWIN SAUNDERS accepting the office of president of the society, and the secretary reported that Sir EDWIN had contributed the sum of five guineas to the Holmes Memorial Challenge Cups Fund. The arrangements for the conference on the proposed increase in the size of show-boards for Japanese blooms was then considered, and eventually a small committee was appointed to arrange the details of the conference, consisting of Messrs. W. E. BOYCE, NORMAN DAVIS, GEORGE GORDON, H. J. JONES, and B. WYNNE, with the officers of the society *ex officio*. It being desirable that a supplement to the society's centenary edition of the Chrysanthemum catalogue should be prepared, the committee instructed the Catalogue Revision Committee to prepare the same, and, if possible, have it ready by the month of October. A communication was read from the Wellington Horticultural Society, New Zealand, referring for adjudication to this committee two matters which had arisen in connection with their recent Chrysanthemum show, and upon which they desired an authoritative declaration. The subjects were fully discussed, and the secretary instructed to reply in the terms agreed upon. A communication of more than ordinary interest was read from Mr. JOHN EARLAND, Wellington, New Zealand, informing the committee he had raised some seedling Chrysanthemums, the blooms of which he was desirous of sending to England for the opinion of that body;

and that he had made arrangements to have the blooms frozen in blocks of ice at the meat-freezing works in Wellington, and would forward the same to London by steamer carrying the frozen meat. On the arrival of the ship in London, the block of ice containing the flowers would be placed in the storage chamber until

country, and their arrival in London may shortly be looked for. A sub-committee was appointed to select designs for and purchase the Holmes' Memorial Challenge Cups offered, which are to be awarded at the large exhibition in November next. The Secretary announced that arrangements had been made for the annual outing of the members to

Eight new members were elected, and the Highbury Vale Chrysanthemum Society was admitted to affiliation. The proceedings closed with the usual vote of thanks to the Chairman.

MR. BERNARD DYER.—The new list of Doctors of Science of the University of London includes the name of Mr. BERNARD DYER, on whom the degree has been conferred for contributions to the chemistry of agriculture. The other names on the list are, in the department of chemistry; those of Mr. S. F. DUTTON and Mr. W. P. WYNNE; and, in the department of zoology, that of Mr. T. JEFFREY PARKER.

LAPAGERIAS.—M. SCHNEIDER is cited in the *Journal de la Société Nationale d'Horticulture de France* as saying that the fertilisation of the white variety of *Lapageria rosea* in Messrs. VERTCH'S nursery, by its own pollen, has always resulted in the production of seedlings which in due time bore rose-coloured flowers.

MANCHESTER ROSE SHOW.—The date of this Exhibition is fixed for Friday and Saturday, July 22 and 23.

STEVIA SERRATA VAR. ALBO-MARGINATIS.—A pretty novelty, with lanceolate white and green foliage, that will be, according to MÖLLER'S *Deutsche Gärtner Zeitung*, as indispensable in time as *Pyrethrum aureum* in bedding. Cultivation is extremely simple, and propagation is rapid and certain. From the figures given in the above journal, which show standard and dwarf forms of the plant, it would make an admirable plant for carpet beds, and edgings to other beds.

WATER SUPPLY TO MANSIONS.—We commend to the notice of country gentlemen and others an illustrated pamphlet by Messrs. MERRYWEATHER of Long Acre, showing the various methods of procuring and distributing a supply of this essential fluid. Save to professed engineers, these matters are often sheer mysteries, but the pamphlet in question conveys in a simple style information which every proprietor, and every steward, and gardener, or bailiff, would find it advantageous to possess.

E. D. SHUTTLEWORTH & CO. LIMITED.—We notice in a trade list recently sent to us, that Messrs. SHUTTLEWORTH, of the Nurseries, Peckham Rye, have taken land at Fleet, Hants, and are engaged in the cultivation of Conifers, deciduous trees and shrubs, Roses, Clematis, &c.

MESSRS. SUTTONS' GLOXINIAS.—A few days ago we had the opportunity of seeing at Reading Messrs. SUTTONS' magnificent strain of Gloxinia. For substance and brilliancy of colour of the flowers, this strain is very remarkable, as is also the peculiar manner in which the leaves curl over to hide the pot. The netted varieties, in which the patches of colour are separated by a network of white or lighter ground colour, are very beautiful; but perhaps the gem of the whole collection was a superb pure white flower, named Her Majesty. We saw Her Majesty just as she was about to proceed to Richmond, and had no hesitation in predicting the success which, we learn, awaited her arrival at that exhibition.

ROSEMARY.—Mr. CROUCHER writes from Ochtertyre that he has lately removed an old Rosemary planted over 60 years, the stem of which girthed over 12 inches.

WEATHER FLUCTUATIONS.—Among the weather reports we have received lately was one we ought to have mentioned before, as it refers to the temperature of some days in the last month. At Ochtertyre, near Crieff, Mr. CROUCHER writes, the maximum shade temperature on June 9 was 82°. The next day it was no more than 49°. On the 14th there were 2° of frost, and the hills on the 11th and 12th were covered with snow.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, July 12, a meeting of the various Committees will take place in the Drill Hall, James Street,

FIG. 8.—VIEW OF OLD WALL IN THE TRINITY COLLEGE GARDEN, DUBLIN. (SEE P. 33.)

arrangements could be made for placing them before the committee. The committee regarding this as an extremely interesting experiment, it was resolved that as soon as it is known the blocks of ice are received in London, a meeting of the General and Floral Committee should be called to examine the flowers and report upon them. A subsequent communication received from New Zealand informs the committee that the flowers are on their way to this

take place on Friday, July 22nd, when a visit would be made to Penshurst Place, Kent, by the kind permission of Lord De LISLE; and permission had also been given by F. E. HILLS, Esq., for a visit to be made to Redleaf on the way from the station. One feature in the day's proceedings will be a cricket-match between an eleven selected from the members of the National Chrysanthemum Society, and one from the Sevenoaks Gardeners' Society.

Westminster, and prizes will be awarded to amateurs for hardy herbaceous perennials. The Rev. E. HANDELY will read a paper at 3 P.M. on "Orchids for a Cool Greenhouse;" and the Mantell Silver Challenge Cup (value 25 guineas), will be offered in an open competition for twenty-four Roses, distinct, three blooms of each.

BEGONIAS.—Messrs. SUTTON have been working at a strain of fibrous-rooted Begonias of the semperflorens type. Of course these look well at Reading, but it is satisfactory to find that they give excellent promise as bedding plants at Chiswick.

THE DRY SEASON.—Numerous reports from various parts of the country have reached us, which, however, we cannot insert in detail. Mr. Lowe writes from Shirenewton as follows:—"The present drought, and the extremely dry air of the past fortnight, have been far more destructive to vegetable life than the winter frosts. A difference between the wet and dry bulb thermometer of more than 19° at a shade temperature under 70°, is an almost unknown amount. Added to this, there has scarcely been any cloud. Variegated Sage, all the St. John's Worts, *Olearia stellulata*, Thyme, every *Cistus*, *Carpenteria californica*, *Heuchera sanguinea*, *Rosa camellifolia*, *Macartney Rose*, Pansies, common Laurel, Lavender, Iberis, *Ferula giganta*, *Choisya ternata*, &c. (if not all dead) have suffered most severely. There has been a deficiency of rain in each month this year. The average, up to April 15, is 10 inches, whilst the actual amount reached 49 inches, leaving a deficiency of 530 tons of water per acre. There seems no doubt this is the drought of 1890 repeating itself. At 7 P.M. on the 31st, and at the same time on April 1, there was 15.9° of terrestrial radiation; and at 8.45 P.M. on the 2nd, 15°.

FUNGUS ON WEYMOUTH PINE AND ON CURRANTS.—A short time since we received from a correspondent a shoot of the Weymouth Pine, *Pinus Strobus*, affected with a fungus which we took to be *Peridermium pini*, which is not very rare on Pines. On subsequently submitting the specimen, at his request, to Dr. KLEBANN, of Bremen, that botanist at once declared it to be his *Peridermium Strobi*, a fungus which he states passes part of its existence under a very different appearance on leaves of various species of *Ribes*, and which is then known as *Cronartium ribicola*. This latter form, however, was not known to be a native of this country. A few days after Dr. FLOWRIGHT sent us the following letter, accompanied by a specimen of the *Cronartium* identical with what had been sent from Bremen. We shall shortly publish Dr. KLEBANN'S letter and illustrations, and in the meantime can only recommend planters to take care that Currant bushes are removed from the neighbourhood of *Pinus Strobus*, *P. Lambertiana*, and *P. Cembra*. The fungus in question attacks the bark (not the leaves) of the Pine in the form of *Peridermium strobi*, and the leaves of various species of *Ribes* in the shape of *Cronartium ribicola*:—

"*Cronartium ribicola*, Dietr.—Although this parasitic Uredine is very common on the continent of Europe, it has not yet to my knowledge been observed in this country. For some years past I have been on the look out for it, and was rewarded on Saturday last by finding it near King's Lynn. It occurred in black and white Currant bushes in the garden of Mr. G. C. BOYES, Oakwood House. The specimen showed both uredo and teleutospores. The former germinated very readily in water, emitting very slender germ-tubes. It is a heterocious species, as has been shown by Dr. H. KLEBANN, of Bremen, having its ascidio-pores in *Pinus Strobus* (= *Peridermium strobi*, Kleb.)—CHARLES B. FLOWRIGHT, M.D."

GARDENERS AND SURVEYORS.—An old gardener writes us a letter, much too long for publication, in which he indignantly contrasts the social position, education, and acquirements of a gardener with those of a surveyor, much to the advantage of the former. If the gardener does his work well, and the surveyor confines himself to his own department, we do not see the necessity for instituting comparisons. We do, however, think from the following statement that the gardener is underpaid, considering the forethought, experience, and skill demanded of him. In the present crowded

state of the labour market, such complaints as our correspondent makes are futile. An improved social position may, however, gradually be obtained by improved education, combined with hard work and high character. Artificial restrictions, such as the limitation of the number of apprentices, can have no permanent effect. "Will you allow me space to call the attention of my brother gardeners to the following indignity to gardeners. A few days ago I saw an advertisement asking experienced gardeners to offer themselves for appointment as gardener to a vestry committee, wages, 24s. per week, with uniform. As the advertisement made a strong point of wanting a thoroughly experienced gardener, and the wages low, I thought the duties would be almost nominal. Just the place for a man in the decline of life. In answer to my letter, judge my surprise to receive the following list of duties, not a word being said about the size of the garden:—To be in attendance daily during the hours the gardens are open to the public, and also on two Sundays in each month. To lay out all flower-beds, sow the seeds and put in the plants at the proper seasons; keep the grass well mown, trim and prune all the trees and shrubs, spread and dig in manure, do all necessary watering, dig up and weed the beds, thoroughly preserve the appearance of the gardens and paths, roll the grass and the paths, and keep them free from weeds, paper, and other refuse; keep the seats clean, and carry out all other duties which may be required by the surveyor; to preserve order in the garden, and see that the seats, flowers, trees, shrubs, &c., are not damaged. The following table shows the time of opening and closing the gardens:—

Month.	Time of Opening.		All Days Closing.
	Weekday.	Sunday.	
January, February ...	8 A.M.	9 A.M.	5 P.M.
November, December ...	8 A.M.	9 A.M.	5 P.M.
April and September ...	7 ..	9 ..	7 ..
March and October ...	7 ..	9 ..	6 ..
May and August ...	6 ..	7 ..	8 ..
June and July ...	6 ..	8 ..	9 ..

The gardener will not be allowed to leave the gardens for his breakfast, but a shelter will be provided with an oil-stove and apparatus for boiling water. He will be allowed to go away one hour for his dinner; and the following holidays will be allowed without any deduction from wages:—Christmas Day, Good Friday, all Bank holidays, and one week during summer. A pair of hoots and uniform, consisting of hat, coat, vest, and trousers, every year, and an overcoat every two years. Note.—Candidates must have had experience in the management of a garden, and no person except those possessing a thorough knowledge of gardening need apply."

EMIGRATION.—We have received the following from the Emigrants' Information Office, 31, Broadway, Westminster, S.W., taking as much of it as applies to country folk:—The July Circulars of the Emigrants' Information Office, and the annual editions of the penny and other Handbooks, with maps, show the present prospects of emigration. A new handbook is also issued, dealing with the Argentine Republic. Among the various Consular reports, all of which can be bought from this office, a most valuable report on the earnings of labour and cost of living in the consular district of Chicago, U.S., including the States of Illinois, Missouri, Iowa, Wisconsin, Minnesota, Nebraska, Kansas, and Colorado, has just been published, price 3d. In Canada there is likely to be a good demand during this quarter for farm labourers, general labourers, navvies, and for mechanics in the building trades. The Canadian Government is offering bonuses of 5 to 10 dols. a head to those who take up land in the North-west or British Columbia. In New South Wales mechanics are not wanted, but in some country districts there is a demand for experienced farm and general labourers. A large number of persons have applied for work at the Government Labour Bureau at Sydney. The depression in Vic-

toria still continues, especially in the building and kindred trades. In South Australia there are good openings for ploughmen and for married couples on stations, but the supply of labour has been quite equal to the demand. The Queensland Government withdrew their free passages last February, so that now all except nominated and indented emigrants have to pay full fares. There is no demand whatever for mechanics in Queensland at present. Western Australia still offers free and reduced passages to certain classes of emigrants; and there is a demand for a limited number of farm labourers, men in the building trades, miners, and labourers on railways and public works. In various districts of New Zealand, there is a demand for farm and station hands, and for miners; and prospects generally are good. The new Government Labour Bureau at Wellington is proving very useful, and new arrivals should apply there or at one of its 200 country branches. Cape Colony and Natal offer reduced passages to mechanics, female servants and others, for whom there is a limited demand. In all the above-mentioned colonies there is a demand for small capitalists, farmers, fruit growers, and female servants. As it is announced that a commission has been appointed by the Brazilian Government to encourage the introduction of European agricultural labourers into some of the northern provinces of Brazil, it becomes necessary to repeat again most strongly the warnings which have been frequently issued from this office against British emigration to that country. However great may be its natural resources, it has been abundantly shown that the conditions of life are wholly unsuited to the ordinary British workman, and intending emigrants are therefore most earnestly cautioned not to be induced by any offer of free or assisted passage or grant of land to go out to Brazil.

PROVISIONAL NAMES.—Reforms are not always carried out because their value is obvious and their nature simple. Take the case of provisional names. An exhibitor shows what he deems rightly or wrongly to be a new plant. The Society (we are speaking of the Royal Horticultural Society), declines to give an award to such a plant unless it is named. Accordingly the exhibitor, or some one for him, gives it a name. If, as is usually the case, there has been no opportunity of ascertaining what the plant really is—a provisional name is given, and when the Floral or the Orchid Committees are very virtuous they award a Certificate to the plant (provided they deem it worthy of it), subject to the confirmation of the name. So far good, but in nine cases out of ten the provisional name is cast in the same mould as an authorised name would be, and it generally sticks to the plant for ever and aye, even if a legitimate name be subsequently discovered or applied. We would therefore suggest, as we have often done before, that provisional names should be in the English language, and thus avoid all confusion with the technical name which must as, heretofore, be in cosmopolitan Latin. Names of garden varieties, and of slight variations from well known species, should also be in English.

SALICYLIC ACID AS A PRESERVATIVE FOR PLANTS.—The use of spirits of wine, glycerine, or other substances, for the preservation of botanical specimens for museum purposes, or for the purpose of anatomical investigations, is, as every one knows who has tried them, more or less unsatisfactory. M. POISSON has therefore been led to try a solution of salicylic acid, of which he reports favourably in the Bulletin of the Botanical Society of France. The most serviceable proportions are 2 grammes of the acid to a litre of soft water, well stirring the mixture to ensure solution (a gramme equals 15.4 grains; a litre equals one pint and three-quarters; half a drachm of the acid to a quart will therefore be an approximate amount). M. POISSON recommends the solution on the ground that it acts as a perfect preservative, that it retains the colour of the object for a long period, that it is relatively cheap, that it can be used by travellers who might find a difficulty in procuring or carrying with them sufficient alcohol.

Our fruit preservers we believe avail themselves on a large scale of the preservative properties of salicylic acid.

MR. BULL'S ORCHIDS.—The rare *Bulbophyllum reticulatum* is now flowering among other choice things in Mr. WILLIAM BULL'S Orchid Exhibition. This species is one of the most attractive in this curious and remarkable genus.

HORTICULTURAL LITERATURE.—Mr. W. M. PAUL, of Waltham Cross, is about to publish a selection of articles written for gardening periodicals and papers read before various societies between the years 1843 and 1892. It will form an 8vo volume of about 600 pages, and will appear early in the autumn of the present year. The matured experience of such a practitioner as Mr. PAUL will be of very great value.

HORTICULTURAL SHOWS.—Among other reports which have reached us are those of the Croydon Horticultural, at which Roses, greenhouse and stove plants formed a principal feature. The Ancient Society of York Florists, in which cut flowers of various kinds, and herbaceous plants, shown by Messrs. BACKHOUSE were prominent. The Scottish Horticultural Association had Begonias, and other collections. To some of these we may refer later on, if space permit.

"PHENOLOGICAL OBSERVATIONS FOR 1891."—Mr. MAWLEY has issued an off-print from the Quarterly Journal of the Royal Meteorological Society, summarising the results of the observations made in various parts of the country on the vegetation as connected with season, &c. The methods of observation have been simplified, so as to secure uniformity, but with every care to secure uniform observations, it is evident that much variation must inevitably accrue. The only ways to "correct" this error, are to insist on the highest attainable accuracy, and to largely increase the number of observers and the area of observations. Much requires to be done in the latter direction, for whilst England furnishes nearly a hundred observers, Scotland has but seven, and Ireland six. The east of Scotland is entirely unrepresented, and many more observers are desired in north England as well as in all Scotch and Irish districts. The winter of 1890—91 was very severe in the south of England, but much less so in Scotland. It was also one of the driest winters on record, and the land was left in good condition for tillage. The spring of 1891 was also cold and dry, and vegetation very backward. Spring frosts destroyed much of the fruit blossom. Summer was deficient in bright sunshine; and July and August in the south, cold, wet, and sunless. This state of things improved in September, but speedily relapsed into cold and wet, so that harvest was late, and the autumn sowing of wheat delayed, and in some cases rendered impracticable. Reports of this character continued over a long series of years will be of the highest value, and we trust Mr. MAWLEY'S may receive every encouragement to persevere in this useful work.

BOTANICAL NOMENCLATURE.—An important manifesto, which derives additional interest from the circumstance that it was dictated by Dr. SERENO WATSON, in his last illness, has just been published in the *Botanical Gazette*. We are told that it was at his express wish that this should be made public. It is a protest, on the ground that botany is the science of plants, and not the science of names, against a too rigid adherence to the law of priority. Dr. WATSON advocates adherence to the practice of the Kew botanists, of Dr. ASA GRAY, and others, who, while generally adhering to the rule of priority, consider that convenience, or as Dr. WATSON puts it, "expediency," demands that the interests of science should in particular cases, override any merely technical claims of priority.

BRANCHING STRAWBERRIES.—Several inquiries have reached us as to the peculiar lobing of the fruit which seems to be common this year. The matter

admits of very simple explanation. The so-called fruit of the Strawberry is merely the extreme end of the stalk that gives off from its sides in succession the several parts of the flower, and ultimately the true fruits or seed-vessels (the pips), commonly but erroneously called the seeds. Now a stalk is nothing more than a portion of the stem, and it is the business of the stem to produce branches, and of the branches to form branchlets and so on according to the necessities of the case and the conditions under which the plant is growing. The lobed Strawberry is simply a branched Strawberry. In the Cockscomb varieties the branches begin to form, but they do not manage to free themselves, but remain in union, forming a flattish lobulated mass.

CAMBRIDGE.—In the annual report of the Botanic Garden Syndicate, dated June 9, 1892, it is noted:—The new range of plant houses, commenced in 1888, has been completed during the past year, with the exception of the Filmy Fern-house. The plants have been safely removed from the old houses to their new quarters, and promise to do well. Special efforts have been made to improve their condition by cleansing, potting, and pruning. The succulent plants in particular present an improved appearance. The labelling of plants continues to receive attention. An improvement has been made at the end of the bog-garden, where moisture-loving plants of various kinds are grown, by the substitution of stone for tree-stumps. These were objectionable on account of the fungi growing upon them, and are now removed to a more suitable position for the purpose of yielding supplies of fungi. The bed of peat in which the Ericaceæ are grown has been enlarged, and in its altered condition has proved to be satisfactory. The material necessary for this extension has been obtained by several years' accumulation, but the area under cultivation is still too small for the needs of the garden. About 1168 plants and 1336 packets of seeds have been received. As showing the progress of the garden, it may be mentioned that in summer, when annuals were in growth, no fewer than a fourth of the genera of the vegetable kingdom, according to the standard of the *Genera Plantarum*, were represented. Many specimens have been added to the Botanical Museum from the garden.

THE COLOUR OF CARROTS.—Where does the red colour come from? The roots of the wild Carrot are, so far as we know, not red, and we have lately examined several roots of the maritime variety, *Daucus maritima*, and they are not red. Still, there is a tendency in the plant to produce a red colour, as occasionally the central flower of the umbel is of a deep purple colour, whilst all around are whitish—why? The Carrot has been known from the earliest times, and its origin from either of the two forms above mentioned is only a matter of assumption. There are other species from which it might have descended.

ABACACHI PINES.—M. ANDRÉ describes, in a recent number of the *Revue Horticole*, a Pine-apple similar to those which we have frequently figured in our columns, in which the central or terminal leaf-tuft is relatively small, but where, by compensatory development, a whole crop of side buds is produced at the base, these side-buds developing into fruit in the usual way. The Abacaxi or Abacachi Pine seems to be a fixed race in Brazil, and to be greatly esteemed by the inhabitants of that country for its fine flavour.

HYBRID RHODODENDRONS.—In the *Illustration Horticole*, M. RODIGAS describes, under the general name of Azaleodendron, a series of forms raised by M. GUSTAV VANDER MEULEN between some hardy Rhododendrons and *Azalea mollis*, the former being the pollen-parent. The styles in all the hybrids are so long that they project beyond the unopened bud. The inverse cross, where the pollen of *Azalea* was used on the stigma of the Rhododendron, produced flowers in which the styles were, on the contrary, very short. The plants are rather tender, but if placed in a cool-house on the approach of frost, they will flower freely in four or five weeks, which renders them valuable for early-flowering. They bear hard-

pruning, the young shoots subsequently produced flowering freely. M. VANDER MEULEN finds they do best grafted on *Rhododendron ponticum*.

UNION HORTICOLE FRANÇAISE ET ÉTRANGÈRE.—We are glad to receive the annual report of this young Society, which has its seat in Paris, Avenue Victoria 16, and whose object it is to bring about good relations between the young French gardeners and their colleagues of other nationalities, to furnish useful information on all matters scientific, practical, and social, connected with horticulture. Fortnightly meetings are held, at which papers are read and other business transacted. M. MAX CORNU is the honorary President, and M. ERNEST BERGMANN, honorary Secretary, the acting President being M. H. MARTINET, with M. TIXIER as Secretary.

CROSS-BREEDING AND HYBRIDISING.—Professor BAILEY has published in convenient and inexpensive form his lecture on this subject. [New York: Rural Publishing Company.] Professor BAILEY gives a summary of what is known on the matter, narrates some of the results of his own personal experiments, and sums up thus:—"Encourage in every way crosses within the limits of the variety and in connection with change of stock, expecting increase in vigour and productiveness; hybridise if you wish to experiment, but do it carefully, honestly, and thoroughly, and do not expect too much! Extend DARWIN'S famous remark to read—Nature abhors both perpetual self-fertilisation and hybridisation." The bibliography, in which Professor BAILEY gives a list of publications, memoirs, &c., devoted to cross-breeding and hybridising, though obviously incomplete, will be very useful, and is not the least service Professor BAILEY has rendered to progressive horticulture.

EXHIBITION OF NATIVE AND GARDEN FLOWERS AT DUNDEE.—An exhibition of native and garden flowers, the second of its kind held in Dundee, was opened on Friday, July 1, in the City Assembly Rooms, in presence of a large company of ladies and gentlemen. Compared with that of last year, the display was superior both in point of numbers and quality; and in variety, richness of bloom, and brilliance of colour, little was left to be desired.

ROYAL BOTANIC SOCIETY.—The evening *fête* of the Society was held on Wednesday evening last, when, although the weather remained fine, and Messrs. L. D. BERRY & SONS had carried out the illuminations of the grounds as prettily as usual, the general effect was marred by the strong winds which continually blew out the lights. The attendance, too, was rather below the average, doubtless on account of the weather, and perhaps partly by reason of the General Election. Notwithstanding these things, however, a very enjoyable evening was spent.

THE DELEGATE CONFERENCE OF GARDENERS' ASSOCIATIONS, called by the members of the Tunbridge Wells Gardeners' Association, and to which notice has already been directed, was held on Wednesday last. About fifty persons interested in gardening were present, among them being Mr. BOND, of Swanley College; several of the secretaries of various local societies; Mr. BARRON, of the *Gardeners' Chronicle*; Mr. R. DEAN, who contributed a paper on Gardeners' Societies; Mr. FROST, of Maidstone, and others. At the dinner in the evening the MAYOR presided. Mr. Cornwall said that the existence of so many Gardeners' Associations throughout the country showed plainly that the members desired to co-operate in some direction for mutual benefit. At present, each body acted in an independent way; there was an absence of organisation and centralisation. Mr. Cornwall then spoke of the many advantages that would accrue by co-operation among gardeners, who would then be able as a body, and should endeavour, to get themselves represented by a State department, which it deserved as much as did agriculture. He advocated the scheme on general grounds, not for the personal benefit of individuals. He had visited the fruit show

held at the Guildhall, and been struck with the possible developments of fruit growing, but he felt that the promoters of that exhibition were not in touch with those whose interests were to be considered. He did not suggest a trade union, and had no desire to come between employer and employed, but he urged that gardeners should be an organised body, and until they were so, they would be in the background. There could be a system of examinations, and certificates might be granted, and the profession thus protected. Mr. Bond, of the Horticultural College, Swanley, spoke very forcibly on the strength of union, but asked for a more definite scheme. They had no foundation to work upon. Was the Association to look to the science and art of horticulture? If so, he would point out that there already existed a body doing its utmost to promote those interests, viz., the Royal Horticultural Society; he could not advise them to enter into competition with it, and they should not endeavour to supplant it until they knew that they had something considerably better. Perhaps a trades union could do much service to the gardener, but such unions were often defective, because of the governing body not fully understanding the local colour of a particular matter on which they were at work. He agreed with the principle of profit-sharing. Mr. Cornwall said the influence of the Royal Horticultural Society on local associations was practically nil. They wanted that body to come to them—not for them to go up to its meetings in London. The majority of members spoke very strongly against any approach to trade unionism. A delegate (from Cranbrook) pointed out that the question of certificates for gardeners was not new, as it had been taken in hand years ago by the Royal Horticultural Society, when he obtained one. Mr. Balchin (Brighton) wanted to know how the local societies were to benefit. After considerable discussion, it was decided to form an Association of Delegates, and a provisional committee was appointed to draw up a scheme, but at the present time no one can say the lines on which the new Association is to be built.

EARL'S COURT HORTICULTURAL EXHIBITION.

—Very complete arrangements have been made to protect the buildings from fire. Large high-pressure mains run through the principal galleries, theatre, concert-hall, &c., to which are connected twenty-five stations with stand-post hydrants, hose, hand-pumps, and buckets. Small fire-engines are also distributed through the buildings. These arrangements, as in previous exhibitions, have been made by Messrs. SHAND, MASON & Co., who also exhibit steam and manual fire-engines and other appliances. Superintendent DUCK is in charge of an efficient brigade, composed of men who have been through the Metropolitan Fire Brigade.

AUTOMATIC DAMPER.—A means of regulating the draught of garden furnaces has for a long time been a desideratum with those whose occupations interfere with a regular attendance to the fire during the day, and with all who must have the heating apparatus in action at night. The inventor claims for the damper the following advantages: The damper being worked by the temperature of the water in the pipes of greenhouses, will maintain it about the same temperature as long as the fire gives out heat. The damper being closed, or nearly so, when the maximum temperature of water is attained, the fire then only consumes sufficient fuel to keep up that temperature, and there is no fear of the temperature getting so hot as to force water out of the boiler. The necessity of constant attention is done away with as the damper closes as the heat increases, and at a certain point, to which it can be adjusted, it will remain almost without variation whilst the fire remains with a body of fuel to burn, so that if the boiler is charged with fuel at night, it will continue burning until exhausted. The increase of the hulk in water allows the patentee to utilise a rise and fall of the float in the supply-cistern, varying from 2 to 8 inches,

according to the length of piping heated, and the size of the cistern. They can be applied to nearly all the boilers now used for heating purposes, with little trouble or expense. We have examined the invention, which seems to be an extremely simple one, and which, if the water in the supply cistern be regulated according to the amount of piping, and the expansion pipe, if any, be of small diameter, can scarcely fail to act efficiently.

BOOKS AND PUBLICATIONS RECEIVED.—*Bees for Pleasure and Profit*, by G. GORDON SAMSON. (CROSBY LOCKWOOD & SON, London.) *Fruit Culture*, by W. E. STRONG (New York Publishing Co.).

HOME CORRESPONDENCE.

TO PRUNE OR NOT TO PRUNE NEWLY-PLANTED FRUIT TREES.—That is the question raised by "Pomum" at pp. 730, 731 of the last volume of the *Gardeners' Chronicle*. Not a few of us had hoped that the senseless process of growing fruit trees for faggot wood had come to an end, through the reign of law and the light of common sense. But no, according to "Pomum," if you want growing vigour and fertile force you must lay the foundation of both by cutting back your already well formed fully-equipped fruit-bearing trees to the smallest dimensions. True the modern methods of hastening and heightening fertility have furnished us with a fruit-bearing baby tree ready to hand. But this finished material is to be cut away, and a fresh start made, not to improve or intensify the fertility of the top, but to the waking up the roots. According to Mr. Mer's theory, it seems the roots lag behind the tops a fortnight or more in their start for life and growth in the spring-tide. Granting for the nonce that this may be so to some extent, it is difficult to see how unharnessing the leaders—that is, slashing off any, or ever so much, of the tops—should pull the roots up abreast with them, either in regard to their time or measure of growth. The writers and practitioners who counsel the letting of their fruit trees severely alone after planting, are less solicitous about encouraging greater root-action than the preservation and extension of their fruit-bearing material. Through the development of skill and the investment of capital, baby trees are now fully equipped for their life-long business of fruit-bearing, and much stronger reasons than any advanced by "Pomum" will be needed to show cause why they should not be allowed to do so at once, instead of being cut to pieces with a view of balancing the growing forces between root and top growth, or laying the foundations of fertility or sterility

afresh. Now, why this waste of time and force; and of valuable fruit in embryo? Because, according to "Pomum," the greater root-action, "which was not the object aimed at, does not take place." What does take place, however, is something widely different from this writer's doleful picture of failure, which is all shadow. Here are a few of its deeper shadows. Roots strained, tops starved, opportunities of shaping being lost never to return, debility, indurated glossy olive-brown bark exchanged for a tawny mixture of hazel and saffron; hide or bark-bound. And yet when "Pomum" alights from this flight of strong adjectives, what does he find on the trees themselves? This, as duly written on p. 730, col. c., paragraph 3 from top of page, "Why, that almost the whole of the wood-buds, through the want of proper root nourishment, have been formed into flower-buds, and the advocates of the system neglect to tell us to which of these we are to cut to in the following autumn." This testimony of the complete transformation of wood-buds into fruit-buds through the simplest of all processes, that of leaving the trees severely alone, is invaluable as a fact of supreme importance attested by an unwilling witness. Why, this hastened fertility is the very object and aim of all who prune their young trees lightly, or not at all. Neither is the object of leaving the tops intact to stimulate root-growth, but rather to check it, and turn it into fertile channels. And, as to the form of trees, what are nurseries for, but to mould trees into shape from their infancy. Train up a tree in the way it should go, and when it is old, or transplanted into a new home, there will be no need nor desire to force it to depart from it, or begin living or shaping itself afresh at the point of the knife; and this applies to the habits, the character of the tree, as well as to its shape. Early fertility, properly and wisely managed and adjusted, reproduces itself, and is the keystone of continuous fruit-bearing. For that "like produces like" is as true of fertility as of other features of life and growth. "Pomum's" imaginary difficulty of finding wood-buds to cut back to, only proves the extreme success of the non- or little-pruner's theories and practice. His theories of root-growth and rest are equally unreal. The roots of fruit trees never rest from their labours unless they themselves, or the outlets from their products, are shrivelled with drought, or frozen hard through cold. And has "Pomum" ever tried to measure up the awakening quickening force of disturbance on the growth of roots? If not, let him hasten to master this problem by lifting fruit trees any time during winter, and replanting or laying them in by the heels, and noting their root-growth from time to time. If he has not already done this, the activity and prodigality of root growth quickened into abnormal activity through disturbance will astonish him, and enable him to bury quickly out of sight most of his theories about the roots lagging behind in a state of dormancy, while the tops forge their way upwards into the mellowing warmth of the atmosphere. If the roots may seem less active at first in the race of new life in the spring, does not this arise from the fact that they have been more active all the winter, and have stuffed every bud so full of good things that the next and first steps to active growth must be one of emptying or depletion. But what does this return to the ancient hashings and slashings of our fruit trees mean? These things among others, either that our nurserymen fail to properly train their trees for fruit bearing, or that horticultural skill, in this year 1892, is not equal to the task of removing fruit trees safely from the nursery to their fruiting homes without marring, destroying, or reducing their size through excessive pruning of the finished machine, that is, the fertile tree they expect to be furnished with. The time is near at hand, if it has not already come, when the horticulturist will no more dream of cutting his fruit trees to pieces after planting than the farmer would his new ploughs or reapers, to make them do their work properly. The extra strain on the roots, incident to the support of an entire or slightly reduced top, is probably more than met through the greatly-accelerated root growth arising through disturbance. The moment healthy roots are detached from the soil they manifest an almost feverish anxiety to develop new fibres, and get a fresh grip of the earth. No one who has not noted this abnormal activity of root growth on the heels of disturbance, can be qualified to pronounce, *ex cathedra*, on the precedence of growth as between roots and tops, or the effects of non- or little top-pruning on the permanent health and perpetual fertility of fruit trees. D. T. F.

THE RECENT JUNE FROSTS.—It is hoped that observant gardeners, most of whom have ample opportunity for obtaining exact information, have not failed to secure registers of the extent of frost which did such exceeding harm on the morning of June 15 last. Information as to harm done to tender vegetables and bedding plants, whilst roughly indicative of the severity of the frost for the time of year, yet affords no actual data, and if in place thereof or with it, there can be furnished exact record of the degrees of frost experienced on that cold morning, then will there be something of a meteorological character presented worthy of being handed down to posterity. Some twenty years hence it will not satisfy gardening youth, it is hoped, to give us mere detail information as to the mischief wrought in gardens by frost, so near as within nine days of Midsummer-day. The question will be asked, "How many degrees were recorded in those places where injury seems to have been the worst?" And if none be afforded, the observing faculties of the gardeners of this generation, and neglect to obtain facts of a scientific kind, will come in for severe criticism. So far as the year has gone, and we are now just half-way through it, I do not know of any weather aspect or feature which calls for such marked notice as do the keen harmful frosts and cold wave which came upon us in the middle of June. As to the effects of that wave of cold upon myriads of tender plants, evidence will be afforded, in many cases, all the summer, for from the injuries inflicted some things never can recover. It is true that we can do nothing to prevent these cold waves coming, but at least it is well to have their area and density exactly recorded. *A. D.*

SINGLE-FLOWERED DIANTHUS.—I enclose you samples of a single-flowered Dianthus, which I think you will agree with me in regarding as an acquisition to hardy border plants of much interest. It is supposed to be a hybrid between a Carnation and a Pink, presumably single ones, and the large size of the flower favours this theory, the dark zone being doubtless derived from the latter. The plants I possess appear to have an excellent constitution, and very prolific of flowers. They were raised two years since from seed received under the name of *D. plumarius hybridus*, and are probably synonymous with the variety offered by a Paris firm under the designation of *D. Cyclops*, a preferable one, from its brevity, but my seedlings of this are not yet in flower. The specimens sent include, as you will observe, several distinct shades, varying from nearly pure white to rosy-crimson, all but one being marked with a broad zone of deep purple. Perhaps you will kindly give your opinion of their value. *W. Thompson, Ipswich.* [Varieties of *D. caryophyllus*, as we suppose, but deficient in bright colour. *Ed.*]

THE TOO EARLY REMOVAL OF EXHIBITS AT THE ROYAL HORTICULTURAL SOCIETY MEETING.—At the last meeting at the Drill Hall, I was told there were some splendid cut blooms of different varieties of *Cattleya*, exhibited by Baron Schroder, my informant taking me to where he had seen them. I then learned that they had been removed by a well-known firm long before the usual time for clearing the plants, &c., away. I certainly think that all exhibits brought before the different committees should remain in the hall until the end of meeting. *J. Carrill.*

LARCH FUNGUS.—Mr. Webster says: "The cause of the Larch dying is that the roots of the trees have come in contact with the chalky subsoil, and that he has always warned planters against planting in such soils or on the limestone formation." In this I disagree with him. In the first instance, the roots of Larch are not penetrating ones to any considerable depth, and as Mr. Rogers says, "There are various depths of soil throughout the plantations," and the age at which these trees died precludes that theory, as the roots could not have come in contact with the chalk. I have had the opportunity of seeing large areas of splendid Larch plantations growing up in a healthy state, and producing timber of the very best quality, and know of trees containing 200 cubic feet of timber, sound and in a healthy growing state, growing on the limestone. Mr. Rogers says, "It is his opinion that it is not the soil alone that is accountable for such disastrous results, but a most virulent attack of some particular fungus, which has been assisted by the last two seasons' drought" (?). (The italics are mine). In this statement I likewise disagree, as only last week I had the opportunity of calling attention—in a large public nursery—to Sycamores, Maples, Elms, &c., dying precisely in the same manner as Mr.

Wilson's Larch, as described by Mr. Rogers. The trees made an average growth of from 3 to 4 feet last year, and this season they expanded their leaves, and made from 2 to 3 inches growth, and then died. On making some inquiries, I was told that "they go like that every year," and they grew on a loamy soil on the red sandstone. In this case it was an easy matter to see what was the cause of death—which was not fungus—and to give a remedy against such an occurrence in future. *R. C. McGregor, June 23, 1892.*

SOCIETIES.

NATIONAL ROSE.

JULY 2.—The annual gathering of the National Rose Society took place, as in several previous seasons, at the Crystal Palace, on Saturday, in extremely favourable weather. Some earlier observations had led us to expect a falling off in the size, but not in the quality of the blooms, and Saturday's exhibition confirmed these expectations; and also the fact, sometimes lost sight of by exhibitors and beholders alike, that lack of size does not always mean loss of beauty. This was especially noticeable in some blooms of Her Majesty, which were just of the right size. The day was warm and fine, and the palace was extensively patronised by the admirers of the national flower.

NURSEWOMEN'S CLASSES.

The Challenge Trophy and 1st prize in the leading class for seventy-two distinct varieties, was won by Mr. Frank Cant, of Colchester, who, previous to last year, when his uncle carried off this coveted prize, held it during two years in succession. Upon this occasion, the collection was much better than might have been anticipated, seeing the adverse conditions under which Rose growers have had to tend and cherish their favourites; and although, perhaps, there have been better collections exhibited than this one, it contained many excellent and well-grown specimens. Here, as in the exhibits generally, the Tea-scented varieties appeared in best form. The following were some of the best, Victor Hugo, Reynolds Hole, Caroline Kuster, Her Majesty, Madame de Watteville, Madame Gabrielle Luizet, The Bride, Star of Waltham, Chas. Lefebvre, Queen of Queens, Mrs. John Laing, Marie Verdier, Etienne Levet, Merveille de Lyon, Countess of Oxford, Pride of Waltham, La France, Souvenir d'Un Ami, Madame Eugénie Verdier, E. Y. Teas, Dupuy Jamain, Crown Prince, La France de '89, Marie Baumann, Annie Wood, the striped Pride of Reigate, Horace Vernet, Jeannie Dickson, Souvenir de la Malmaison, Emily Laxton, and Gustave Piganeau. Mr. B. R. Cant, of Colchester, occupied the 2nd position worthily, and staged amongst others excellent examples of Marie Finger, Her Majesty, Mrs. John Laing, Maréchal Niel, Crown Prince, Chas. Lefebvre, Madame Bravy, Mrs. Paul, Catherine Mermet, Duke of Teck, Magna Charta, Lady Mary Fitzwilliam, Marchioness of Dufferin, Lady Ellen Stewart, Cleopatra, Madame Lacharme, and Ulrich Brunner. 3rd, Messrs. Paul & Son, The Old Nurseries, Cheshunt, and here were many very good blooms, including Princess Beatrice, Captain Christy, Etienne Levet, Marguerite de St. Amand, A. K. Williams, Prince Camille de Rohan, and Comtesse de Blacas.

In the class for forty-eight distinct, single trusses, Messrs. G. Cooling & Sons, Bath, obtained the 1st prize. The varieties were as follows:—The Bride, Magna Charta, Madame S. Rodocanachi, Madame Gabrielle Luizet, A. Dumessnil, Honourable Edith Gifford, La France, Victor Verdier, Duke of Connaught, Mrs. Jno. Laing, Sénateur Vaisse, Marguerite de St. Amand, Dr. Andry, Madame Cusin, Maréchal Niel, Mons. Noman, Ernest Pritz, Dupuy Jamain, Prince Arthur, Mrs. Watson, Madame I. Pereire, Anna Olivier, Madame M. Verdier, Comte de Raimbaud, Duchess de Morny, Sénateur Vaisse, F. W. Girdlestone, Victor Hugo, Violette Bowyer, Le Havre, Merveille de Lyon, Victor Lemoine, Duchess de Vallombrosa, Horace Vernet, Marie Cointet, Baron Haussmann, Lady Mary Keith, Robert Marnock, Pride of Waltham, A. K. Williams, Etoile de Lyon, Comtesse d'Oxford, Princess Beatrice, Bartholemy Joubert, Baroness Rothschild, Heinrich Schultheiss, Madame C. Knster, and Ulrich Brunner. Messrs. G. & W. H. Burch, Peterborough, were 2nd; their collection contained good specimens of La France, Star of Waltham, John Stuart Mill, The Bride, Silver Queen, Alfred Colomb, Madame Joseph Desbois, Her Majesty, Louis Van Houtte, François

Michelon, and Ferdinand de Lesseps. The 3rd prize was obtained by the English Fruit and Rose Company, Limited, King's Acre, Hereford.

In the class for forty-eight varieties, distinct, three trusses each, Mr. Frank Cant was 1st; Mr. Benjamin R. Cant, 2nd; and Mr. Charles Turner, The Royal Nurseries, Slough, 3rd.

For twenty-four, distinct, single trusses, the highest honour was obtained by Mr. W. Taylor, Osborn Nursery, Hampton, Middlesex, who had a capital collection, consisting of the following:—Ulrich Brunner, Mrs. G. Dickson, Duke of Edinburgh, Catherine Mermet, Dupuy Jamain, John Laing, Victor Verdier, Madame Gabrielle Luizet, Prince Camille de Rohan, La France, E. Y. Teas, Countess of Pembroke, Louis Van Houtte, Hon. Edith Gifford, Star of Waltham, Her Majesty, Heinrich Schultheiss, Souvenir d'Un Ami, Cheshunt Hybrid, Gloire Lyonnaise, Le Havre, Marie Baumann, Marquise de Castellane, and Baroness Rothschild. Mr. J. Mattack, The Market, Oxford, was a good 2nd, and showed good Comtesse de Nadaillac, Souvenir d'Un Ami, Maréchal Niel, and Princess Mary of Cambridge, &c. The 3rd position was taken by Mr. G. W. Piper, Uckfield, Sussex, the best of his collection being Madame Gabrielle Luizet, Catherine Mermet, and Dupuy Jamain.

In the class for twenty-four distinct varieties, three trusses of each, Messrs. E. Prior & Sons, Myland Nurseries, Colchester, were 1st, who showed much the same varieties that have already been mentioned, but included the good old General Jacqueminot, Jean Ducher, Prince Arthur, Souvenir d'Elise Vardon, Viscountess Folkestone, and Fisher Holmes.

Messrs. G. and W. H. Burch were 2nd, with a nice clean collection; and Mr. George Mount, Exotic and Rose Nurseries, Canterbury, were 3rd, in which latter there were several very good blooms.

AMATEURS.

In the principal class for amateurs, for forty-eight distinct varieties, single trusses, Mr. E. B. Lindsell, the successful exhibitor of last year, again secured the 1st prize, and included excellent blooms of Duchess de Vallombrosa, Marie Van Houtte, Louis Van Houtte, Marie Rady, Maurice Bernardin, The Bride, Chas. Lefebvre, Mons. Noman, Captain Christy, Dupuy Jamain, Comtesse de Nadaillac, Chas. Lefebvre, Innocente Pirola, Gustave Piganeau, Lady Mary Fitzwilliam, Star of Waltham, Her Majesty, Madame G. Luizet, Princess of Wales, Francisia Kruger, S.-M. Rodocanachi, Reynolds Hole, &c.; 2nd, Mr. S. P. Budd; and 3rd, the Rev. J. H. Pemberton, Haveringe-atte-Bower, Essex.

Mr. Walter Drew, Uplands, Leabury, was 1st in the class for twenty-four distinct single trusses, his best were Marquise de Castellane, E. D. Brie, Earl of Dufferin, Niphotos, Dupuy Jamain, Ulrich Brunner, Madame G. Luizet, Her Majesty, Lord Bacon, Merveille de Lyon, François Michelon, and La France. A. Hill Gray, Esq., Beaulieu, Newbridge Hill, Bath, was 2nd, with good Maréchal Niel, La France, Duke of Wellington, Devonensis, The Bride, Lady M. Fitzwilliam, Madame G. Luizet, Catherine Mermet, &c. 3rd, Mr. J. Gurney Fowler, Gelbelands, Woodford, Essex.

For sixteen distinct varieties, three trusses of each, the 1st position was taken by Mr. E. B. Lindsell again, with Souvenir de Elise Vardon, Prince Arthur, La France, Caroline Kuster, Ulrich Brunner, Madame Cusin, Dupuy Jamain, Madame G. Luizet, Exposition de Brie, Chas. Lefebvre, Niphotos, Dr. Sewell, Mrs. Jno. Laing, E. Y. Teas, Innocente Pirola, and François Michelon; 2nd, Mr. S. P. Budd; 3rd, Mr. A. Slaughter, Jarvis Villa, Steyning.

Mr. Walter Drew, Uplands, Leabury, was 1st for twelve distinct, three trusses each, with Duke of Edinburgh, Comte Raimbaud, Jennie Dickson, Madame G. Luizet, Duke of Teck, Ulrich Brunner, La France, &c.; Mrs. Waterlow, Great Doods, Reigate (gr. James Brown), was 2nd; and the Rev. H. Berners, Harkstead Rectory, Ipswich, 3rd.

For twelve single trusses of any hybrid perpetual, Mrs. Waterlow was 1st with very full good blooms of Mrs. J. Laing; A. Hill Gray, Esq., was 2nd, with La France; and Mr. S. P. Budd, 3rd, with large blooms of Ulrich Brunner.

The following five classes were open only to amateurs who grow less than 2000 plants, including Teas and Noisettes:—

For twenty-four distinct single trusses, the Rev. W. J. Romaine, The Priory, Old Windsor, was 1st, the best of whose exhibit were Comtesse d'Oxford, Mrs. Jno. Laing, Madame Welche, Maréchal Niel, Her Majesty, Etienne Levet, Heinrich Schultheiss.

Earl of Dufferin, Viscount Folkestone, and Louis van Houtte; 2nd, Mr. J. C. Taker, Middleton Hall, Brentwood.

For eighteen distinct single trusses, Mr. E. M. Bethune, Denne Park, Horsham, was 1st, with very good blooms of La France, Chas. Darwin, Dupuy Jamain, Madame Gabrielle Luizet, Madame Isaac Pereire, Marie Finger, Mrs. Jno. Laing, A. K. Williams, Duchees of Bedford, &c.; 2nd, Mr. F. T. Baker, Holmfild, Reigate, in which was noticed good examples of Madame G. Luizet, Alfred Colomb, E. Y. Teas, Horace Vernet, General Jacqueminot, Etienne Levat, and Mrs. Jno. Laing; Mr. Ed. Mawley, Rosebank, Berkhamstead, was 3rd.

Mr. W. H. Fowler, Claremont, Taunton, was 1st in the competition for twelve distinct single trusses, showing best Ernest Metz, Innocente Pirola, Niphotos, Prince of Wales, and Souvenir de Elise Vardon; 2nd, Mr. Fred Warde, Aldon, Addington, West Malling; 3rd, Mr. E. Wilkins, Monksdene, Sutton.

For eight distinct triplets, Mr. E. Wilkins was 1st with Maurice Bernardin, La France, A. K. Williams, Earl of Dufferin, Ulrich Brunner, Madame Gabrielle Luizet, Charles Lefebvre, and Le Havre; 2nd, Mr. P. C. G. Burnard, Reigate; and 3rd, the Rev. W. J. Romaine.

Any H.P. Rose, nine blooms.—Madame Gabrielle Luizet, shown by Mr. E. M. Bethune, secured highest honour; and the same variety secured the 2nd place for Mr. E. Wilkins, Monksdene; and the 3rd position for the Rev. W. J. Romaine.

The following four classes, open only to growers of fewer than 1000 plants:—

The best twelve distinct single trusses came from Dr. Tucker, Swanley Junction, who had Her Majesty, Abel Carrière, Duke of Edinburgh, La France, Mrs. John Laing, Dr. Hogg, Captain Christy, Ulrich Brunner, Marquise de Castellane, A. K. Williams, and Charles Darwin; 2nd, Mr. E. J. Grahame, Coombe Road, Croydon; 3rd, Mr. R. L. Knight, Bobbing, Sittingbourne.

Nine distinct, single trusses.—In this class, the Rev. H. B. Biron, Hlythe, was 1st with Le Havre, Madame G. Luizet, Marie Finger, Etienne Levat, Ulrich Brunner, Duke of Wellington, Innocente Pirola, A. K. Williams, and Charles Lefebvre; 2nd, Rev. S. F. Taylor, Littleton Vicarage, Evesham; 3rd, Mr. C. E. Cuthell, Chapel Croft, Dorking.

Six distinct, single trusses.—1st, Dr. Tucker, Swanley Junction; 2nd, Mr. O. G. Orpen, West Bergholt, near Colchester; and 3rd, Mr. C. E. Cuthell.

Any H.P., nine blooms.—Dr. Tucker was again 1st, with large blooms of Her Majesty; Mr. James Parker, Old Headington, Oxon, 2nd, with Madame Gabrielle Luizet; and Mr. C. J. Grahame, 3rd, with Marie Baumann.

The following three classes, open only to growers of fewer than 500 plants:—

Nine distinct single trusses.—In this class Mr. Henry Foster, North Street, Ashford, Kent, was 1st, Mr. G. Moule 2nd, and Mr. E. Rutter, Halliford-on-Thames, Shepperton, 3rd.

Six single trusses.—1st, Mr. Edward Horne, Park House, Reigate, with Ulrich Brunner, Marquise de Castellane, Chas. Lefebvre, François Michelon, Madame Gabrielle Luizet, and Madame I. Pereire; 2nd, Mr. H. P. Landon, Shenfield, Brentwood, Essex; 3rd, Mr. Hugh White, Woodside Cottage, Hlhighgate, N.

In the class for six distinct single trusses, open only to amateurs who have not before won any prize at an exhibition of the National Rose Society, Mr. W. H. Fowler, Claremont, Taunton, was 1st; Mr. W. Hooper, Glens Mount, Sutton, Surrey, 2nd; and Mr. F. S. Francis, Crofton Hall, Orpington, Kent, 3rd.

Six distinct trusses, grown within 8 miles of Charing Cross.—1st, Mr. R. H. Langton, Raymead, Hendon; 2nd, Mr. Walter Northones, 22, Wolsey Road, Crouch End, N.; 3rd, Mr. Jno. Bateman, Rosevale, Archway Road, N.

Six new Roses, distinct.—The Rev. J. H. Pemberton was 1st.

TEAS AND NOISETTE ROSES (NURSEYMEN).

For twenty-four Roses to be shown in single trusses, 1st, Mr. G. Prince, Oxford, who showed (as he always does) a nice lot of fresh-looking blooms, the finest of which were, Comtesse de Nadaillac, Souvenir d'Elise Vardon, Madame de Watteville, Niphotos, La Boule d'Or, Amazon, a bright primrose; and Maréchal Niel, Mons. Furtado, very similar in colour to Amazon; and Madame Kuster. The yellow Roses were very good. In pink Roses, Souvenir d'un Ami, Adam and Ernest Metz, a light pink; and Madame Cusin, a purplish pink, a fairly full Rose. The whites included Edith Gifford, Rubens, Cornelius Koch, The Bride, and Innocente Pirola.

Mr. F. Cant took the 2nd place with blooms generally good, but lacking evenness; M. Niel, Souvenir d'Elise Vardon, Princess, Jean Ducher, and Madame Angèle Lacquier were amongst his finer blooms. Mr. B. R. Cant, who was 3rd, had some unapproachable blooms in his box.

For eighteen Roses, single trusses, distinct.—1st, Mr. J. Mattock, Oxford, with blooms, fresh and cut just at the right moment, Maréchal Niel, Amazon, Marie Van Houtte, Jean Ducher, among Roses of yellow shades; Miss Ethel Brownlow, Souvenir d'un Ami, and Madame de Watteville among pink varieties. 2nd, Messrs. D. Prior & Son, Colchester, Marie Van Houtte, Souvenir d'Elise Vardon, The Bride, and Madame Hoste were his best varieties; Messrs. Burrell & Co., Cambridge, who took the 3rd place, had some fair-sized blooms.

For twelve Roses, single trusses, Maréchal Niel excepted.—1st, Mr. F. Cant with beautiful blooms of Madame de Watteville, than which, none could be finer; 2nd, G. & W. H. Burch, Peterborough, with Niphotos, a perfect lot of this favourite variety; 3rd, Mr. B. R. Cant, with Madame de Watteville. There were eight entries in this class, and Caroline Kuster, Princess of Wales, Comtesse de Nadillac, were well shown by the Oxford men.

For eighteen varieties, three trusses of each, Mr. G. Prince showed blooms of the same varieties he had shown in a previous class, and was placed 1st for a particularly fine boxful; Mr. J. Mattock taking the 2nd place, and Mr. F. Cant the 3rd. Seven entries in all.

AMATEURS.

For eighteen Roses, single trusses, distinct.—1st, Mr. A. Hill Gray, Beaulieu, Bath, his stand gaining for him the National Rose Society's Champion Challenge Trophy; the varieties were Amazon, Niphotos, Marie Van Houtte, Cleopatra, Triomphe de Rennes, Souvenir de Paul Neyron, Maréchal Niel, Madame Bravy, Etoile de Lyon, Madame Cusin, &c. 3rd, Rev. H. Berners, Harkstead Rectory, Ipswich, who had some very excellent blooms. Seven entries in this class.

For twelve single trusses, distinct.—In this competition there were five entries, but the blooms of most of these were not very good. A 3rd prize was awarded to T. B. Haywood, Esq. (gr., Mr. C. J. Salter), Woodhatch, Reigate, for a stand of flowers that would have been fine ones had they not been a little too forward. Anna Olivier, The Bride, Alba Rosea, Jean Ducher were the best.

For twelve distinct varieties, three trusses of each, 1st, Mr. A. Hill Gray, who took with this stand the Townsend-Boscawen Memorial Cup. It was an excellent boxful, and consisted of, amongst others, C. Mermet, Jean Ducher, Edith Gifford, Souvenir de Thérèse Levat, Souvenir d'Elise Vardon, The Bride, and Princess of Wales; 2nd, Rev. F. R. Burnside, Birch Vicarage, Hereford, with Madame Bravy, Madame Cusin, Ernest Metz, and Catherine Mermet—very nice blooms; 3rd, Rev. H. Berners. The large number of ten entries were obtained in this class.

For nine single trusses, there was a strong competition, as many as twelve competitors entering for the contest. 1st, Rev. H. Berners, with blooms perfectly formed and of medium size, of Innocente Pirola; 2nd, E. M. Bethune, Esq., Denne Park, Horsham, with The Bride, rather small blooms; 3rd, Mr. E. B. Lindsell, Bearton, Hitchin, with Catherine Mermet.

Under Subdivision II. of the Tea and Noisette classes, there were four classes set apart for those who are growers of fewer than 500 plants of these varieties in the National Rose Society's catalogue. The first of these is for twelve single trusses, distinct, and here Mr. O. G. Orpe, West Bergholt, Colchester, obtained the Silver Medal of the *Gardeners' Magazine* with some nice blooms, the best of which were Francesca Kruger, Madame Cusin, Ethel Brownlow, and C. Mermet; 2nd, C. J. Grahame, Esq., Coombe Road, Croydon, with some good Roses for that light, gravelly district, viz., Marie Van Houtte, Souvenir d'Elise Vardon, and Madame Hoste; Rev. F. P. Roberts, Scole Rectory, coming 3rd. The competition was weak.

For nine distinct single trusses.—1st, Mr. E. Wilkins, Monksdene, Sutton, Surrey, small, regular, and fair blooms; 2nd, Mr. W. Drew, Uplands, Ledbury. Amongst his flowers there was to be observed the largest one of Niphotos exhibited that day; 3rd, Mr. W. G. Romaine, Priory, Old Windsor. The entries in this last class numbered eight, but the competition was feeble.

For six distinct varieties, three trusses each, 1st, P. G. C. Burnard, Esq., Reigate—a mediocre lot of

blooms; the winners of the 2nd and 3rd were respectively Rev. F. Page Roberts, and Mr. D. G. Orpen.

For six single trusses of any variety, Tea or Noisette, 1st, C. J. Grahame, Esq., with Madame Cusin; 2nd, A. Tate, Esq., Downside, Leatherhead, with Souvenir d'Elise Vardon; 3rd, Rev. J. H. Pemberton, Havering-atte-Bower, with C. Kuster. Competitors numbered eight.

Classes for Growers of fewer than 200 Teas and Noisettes.—For nine distinct, single trusses, 1st, Ed. Mawley, Esq., Rosebank, Berkhamstead, whose flowers were excellent, if small; The Bride, Waban, C. Kuster, Madame Cusin, and Madame Willarmoz were the finer. Dr. Tucker, Swanley Junction, was 2nd, and W. D. Freshfield 3rd.

For six distinct varieties, single trusses, the entries numbered ten, and the 1st prize went to Mrs. C. Cuthbert, Strickstanning Birch, Hereford, whose excellent lot contained fine blooms of The Bride, Marie Van Houtte, Princess of Wales, and Madame Cusin, a very large bloom; 2nd, Rev. F. S. Taylor, Littleton Vicarage, Evesham, with fine Maréchal Niel, Madame Cusin, and Souvenir A. Olivier; 3rd, C. E. Cuthell, Chapel Croft, Dorking.

OPEN CLASSES.

For twelve single trusses of any yellow Rose, 1st, Mr. G. Prince, Oxford, with perfect blooms of Comtesse de Nadaillac; Amazon, which is a bloom that looks well in the mass, obtained the 2nd place for Mr. J. Mattock, Oxford; Mr. F. Cant taking the 3rd with Caroline Kuster.

In the any white Rose class, the winner was Mr. F. Cant, with medium-sized blooms of the Bride; 2nd, Rev. R. F. Burnside with Innocente Pirola, whose blooms ranged from fairly large to quite small ones. Mr. J. Mattock was 3rd, with Rubens. There were eleven entries.

The any crimson, excepting A. K. Williams, Rose class was less numerously filled, but, to our thinking, the most perfect Rose shown on this occasion took the 1st prize, Dupuy Jamain, shown by Mr. B. R. Cant; 2nd, Mr. G. Mount, Canterbury, with Ulrich Brunner; 3rd, Messrs. G. Cooling & Sons, Bath, with Fisher Holmes.

For twelve single trusses of any dark velvety crimson Rose. A weak contest. 1st, Mr. G. Mount, with Fisher Holmes; 2nd, Messrs. Cooling & Sons, with Abbé Regnière, a smallish Rose, of a very dark crimson shade, the back of the petals being of slaty hue. Mr. B. R. Cant came 3rd, with Duke of Edinburgh.

For twelve single trusses of Maréchal Niel, A. Hill Gray, Esq., was 1st, Mr. F. Cant 2nd, and Mr. G. Mount 3rd. On the whole, these blooms were under the normal size.

For twelve Marie Baumann, Mr. G. Mount, 1st, with fine examples; Mr. B. R. Cant, 2nd; and Messrs. Hugh Low & Co., 3rd. None of these could be said to be up to the standard in size.

For twelve single trusses of Mrs. John Laing, Mr. F. Cant who was 1st, showed a very choice box of large even blooms in great perfection; 2nd, Mr. B. R. Cant, with good blooms. Mr. B. R. Cant was 1st for twelve single trusses of A. K. Williams; Messrs. Paul & Son, Cheshunt, 2nd; and the English Fruit and Rose Co., King's Acre, 3rd.

For twelve single trusses of Niphotos there were twelve entries, the winners being—1st, Messrs. Keynes, Williams & Co., Salisbury, with every bloom in perfection; 2nd, Messrs. G. & W. H. Burch; 3rd, Mr. Frank Cant.

For twelve single trusses of Her Majesty, Mr. F. Cant was the sole exhibitor, and his blooms were the perfection of size and form.

For twelve single trusses of any Rose not named above, 1st, Mr. B. R. Cant, with Gabrielle Luizet, a good box, some very fine blooms amongst them; 2nd, Mr. C. Turner, Royal Nurseries, Slough, with Gabrielle Luizet, and Lady M. Fitzwilliam, the latter being of especial excellence.

For six single trusses, C. Mermet, Mr. G. Prince took the 1st place, and Messrs. Paul & Son 2nd.

The prizes for twelve single trusses of any new Rose were taken by Mr. B. R. Cant, 1st, for Gustave Piganeau, a fine large crimson Rose of good quality; Mr. F. Cant and Messrs. W. Paul & Son being equal 2nd for Mrs. Paul; and Mr. F. Cant 3rd, with G. Piganeau.

BEST FLOWER IN THE SHOW.

Nurserymen's.—The medal for the best in the show was won by Mr. Benj. R. Cant, of Colchester, with a bloom of Souvenir d'Elise Vardon.

Best H.P.—This honour went also to Mr. Benj. R. Cant, for his Gustave Piganeau; and, in the

amateur's division, Mr. E. B. Lindsell had shown the best H.P., which, in this case, was Dupuy Jamain.

The same distinction amongst amateurs was gained by Mr. Alfred Tate, Downside, Leatherhead, also with Souvenir d'Elise Vardon.

MISCELLANEOUS.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, showed many boxes of excellent *Rosa*. Messrs. P. Barr & Sons, King Street, Covent Garden, showed hardy perennials in bloom. Mr. W. Rumsey, boxes of *Roses*; Messrs. H. Cannell & Son, Swanley, numerous varieties of tuberous *Begonias*, in trusses of three or four flowers; Messrs. J. Peed & Son, Roupell Park Nurseries, Caladiums, large and small; and Messrs. J. Laing & Son, Stanstead Park Nurseries, Forest Hill, had a showy bank, consisting of plants of hardy perennials, *Caladiums*, *Cannas*, *Begonias*, *Orchids*, *Gloxinias*, &c.

Amongst this class of non-competitive exhibits was an immense stand of plants and cut blooms from Messrs. Paul & Son, Waltham Cross. *Roses* were here shown in rich variety. Particularly noticeable were *White Lady*, shown in excellent form, a pretty *rosea* variety called *White Pet*, *Madame Falcot*, which looked delicately beautiful; *Princess May*, a lovely pink, sweet scented, and good form; *Louisa Van Houtte*, fairly well coloured; *Madame Hoste*, that pretty lemon yellow Tea; and *Capucine*, a distinct bronze.

Messrs. Carter & Co., High Holborn, had a collection of succulent plants in small specimens of the more popular kinds.

Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, exhibited a pleasing collection of hardy flowers, as well as a collection of *Violas*, and some four dozen varieties of *Roses*.

Garden *Roses* were profusely shown as cut blooms by Messrs. Paul & Son the Old Nursery, Cheshunt, Messrs. Cooling & Sons, Bath, and E. F. Such, Maidenhead.

A Silver Medal was awarded Lord Penzance, for seedling *Roses*, mostly Sweet Briars. His lordship showed also a box of double and semi-double-flowered seedlings, *Dick Hatterick*, *Dandy Dinmont*, *Wamba*, *Dugald Dalgetty*, *Edie Ochiltree*, &c.

A. Hill Gray, Esq., showed a fawn-coloured seedling *Rose*, *Alister Stella Gray*, flowers small and double, leaves glistening and small.

INTERNATIONAL HORTICULTURAL EXHIBITION, EARL'S COURT.

JULY 5.—The show of *Roses* at Earl's Court was a decided success, both in the quantity and quality of the exhibits. In the leading classes, which were much the same as those of the National Rose Society at the Crystal Palace on Saturday last, the *Roses*, both H.P.'s and Teas, were much finer. This perhaps may be explained by the lateness of the season, and the fact that exhibitors on the latter occasion had a few more days in which to perfect their blooms.

NURSEYMEN.

In the leading division for seventy-two varieties, Mr. F. Cant, of Colchester, took the same position as he obtained at the Crystal Palace on July 2, with a collection that much surpassed those he exhibited on that date. It consisted of the following varieties:—*Madame George Paul*, *Captain Christy*, *Comtesse d'Oxford*, *The Bride*, *Madame Victor Verdier*, *Marie Van Houtte*, *Catherine Mermet*, *Gustave Piganeau*, *A. Colomb*, *Marchioness of Dufferin*, *Mrs. Baker*, *Comtesse de Nadaillac*, *Charles Darwin*, *Etoile de Lyon*, *Lady Ellen Stewart*, *Souvenir d'un Ami*, *Le Havre*, *Devoniensis*, *Princesse Camille de Rhan*, *Mdlle. Gabrielle Luizet*, *Jean Soupert*, *Anna Olivier*, *Dr. Andry*, *Hon. Edith Gifford*, *Suzanne-Marie Rodocanachi*, *Innocente Pirola*, *General Jacqueminot*, *Pride of Waltham*, *Duke of Teck*, *Madame de Watteville*, *Duke of Connaught*, *Her Majesty*, *Cleopatra*, *Fisher Holmes*, *Maréchal Niel*, *Prince Arthur Jennie Dickson*, *Earl of Dufferin*, *Mary Bennett*, *Exposition de Brie*, *Annie Laxton*, *Duchess of Bedford*, *Mrs. H. Turner*, *Madame Hippolyte Jamain*, *Comte de Raimbaud*, *Comtesse of Pembroke*, *Mons. Noman*, *Countess of Rosebery*, *Marie Rady*, *Mrs. John Laing*, *E. Y. Teas*, *Madame Hoste*, *Madame Cousin*, *Sir Rowland Hill*, *Duke of Edinburgh*, *Ernest Metz*, *Marie Verdier*, *Comtesse de Panisse*, *Horace Vernet*, *Germaine Caillot*, *Heinrich Schultheiss*, *Niphotos*, *Victor Hugo*, *Souvenir d'Elise Vardon*, *A. K. Williams*, *Baroness Rothschild*, *Harrison Weir*, *Jean*

Ducher, *Etienne Levet*, *Dupuy Jamain*, *Lady Mary Fitzwilliam*, and *Chas. Lefebvre*; Mr. Benjamin R. Cant, of Colchester, was a good 2nd; and Messrs. Paul & Son, Old Nurseries, Cheshunt, were 3rd.

In the class for thirty-six single varieties, Mr. B. R. Cant secured premier position, with a very fine lot, most of the varieties were shown in the seventy-two. Mr. F. Cant was 2nd, and Mr. G. Prince, Market Street, Oxford, 3rd. In the class for twenty-four varieties, Mr. Chas. Turner, The Royal Nurseries, Slough, was 1st; Messrs. G. and W. H. Burch, Peterborough, 2nd; and Messrs. Keynes, Williams & Co., The Nurseries, Salisbury, 3rd.

For forty-eight distinct varieties, three trusses of each, Mr. B. R. Cant was again 1st, and Messrs. Paul & Son, Cheshunt, 2nd.

For twenty-four varieties, three trusses of each, Mr. Frank Cant obtained premier position; Mr. Chas. Turner, The Royal Nurseries, Slough, 2nd; and Mr. Geo. Prince, Market Street, Oxford, 3rd. The quality that characterised the H.P.'s was well maintained in the Teas, and in the class for twenty-four Tea and Noisette, distinct, single trusses, Mr. Benjamin R. Cant secured the 1st prize, with a very creditable collection, including particularly good specimens of *Souvenir d'un Ami*, *Niphotos*, *Ernest Metz*, *Ethel Brownlow*, &c. Mr. Frank Cant was 2nd, and Mr. George Prince 3rd.

In the competition for eighteen Tea or Noisette, Mr. George Mount, Canterbury, was 1st. He had excellent *Catherine Mermet*, *The Bride*, *Anna Olivier*, *Hon. E. Gifford*, *Ethel Brownlow*, &c.; 2nd, Messrs. G. W. Piper & Son, Uckfield, Sussex; and 3rd, Messrs. Paul & Son, Cheshunt.

Messrs. Keynes, Williams, & Co., The Nurseries, Salisbury, were 1st in the class for twelve single trusses of any Tea or Noisette, distinct, showing good blooms of climbing *Devoniensis*, but which showed a few marks of the rough weather we have had. Mr. Benjamin R. Cant was 2nd, with *Madame de Watteville*; and Mr. George Prince 3rd, with *Comtesse de Nadaillac*.

OPEN CLASSES.

For twelve hybrid perpetuals of any one sort, Messrs. Perkins & Son, Coventry, were 1st, with excellent blooms of *Lady Mary Fitzwilliam*, Mr. Chas. Turner, A. K. Williams, 2nd; and *Gustave Piganeau*, shown by Mr. Benjamin R. Cant, 3rd.

For twelve Teas, of any sort, Mr. Benjamin R. Cant showed well-coloured blooms of *Innocente Pirola*; and Mr. F. Cant, who was 2nd, had good *Madame de Watteville*; whilst Mr. G. Prince was 3rd. In the competition for nine Tea or Noisette, single trusses of any new variety introduced since 1889, Mr. G. Prince fared best with a nice sample of *Souvenir de S. A. Prince*; and Messrs. Paul & Son, Cheshunt, 2nd, with *Ernest Metz*. Messrs. Lambert & Reiter, Treves, Germany, had a hybrid Tea, called *Auguste Victoria*.

For three single trusses of any new seedling *Rose* or distinct sport, either not in commerce, or not distributed earlier than November, 1891, Messrs. Wm. Paul & Son, Waltham Cross, showed their new and pretty *Corunna*, which has been often described lately; and Messrs. Paul & Son, Cheshunt, were 2nd with *Paul's Early Blush*, H.P. Messrs. Paul & Son, Cheshunt, were 1st for thirty-six bunches of garden *Roses*, distinct varieties, not less than three trusses to a bunch; and Mr. E. F. Such, Maidenhead, was 2nd.

AMATEURS.

In the leading class for forty-eight *Roses*, distinct, single trusses, the 1st prize went to Mr. E. B. Lindsell, Bearton, Hitchin, who included in his collection really fine examples of *Earl Dufferin*, *Etienne Levet*, *Etoile de Lyon*, *A. K. Williams*, *Ulrich Brunner*, *E. Y. Teas*, *Captain Christy*, *Maurice Bernardin*, *Marie Baumann*, *The Bride*, *Beauty of Waltham*, *Louisa van Houtte*, *Duke of Connaught*, *François Michelin*, and *Her Majesty*; the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, was 2nd, and Mr. H. V. Machin, Gateford Hill, Worksop, 3rd.

For eighteen *Roses*, distinct, three trusses of each, each of the exhibitors in the above class took their respective places in this one also. Mr. R. Knight, Bobbing, Sittingbourne, secured the highest award for eighteen *Roses*, distinct, single trusses, *J. C. Tasker*, Esq., Middleton Hall, Brentwood (gr. P. Perry), 2nd; and Mr. J. Bateman, Rosevale, Archway Road, N., 3rd.

For eighteen Tea and Noisette, distinct, single trusses, Mr. E. B. Lindsell was again successful; the Rev. J. H. Pemberton, 2nd; and Mr. Henry V. Machin, Gateford Hill, Worksop, 3rd; Mr. R. Knight,

Bobbing, Sittingbourne, was 1st for twelve Tea and Noisette, distinct, single trusses.

TABLE DECORATIONS, &c.

There were numerous competitors for the prizes for table decoration. Dinner-table completely laid out for twelve persons (open). Most of these were tastefully executed, and the judges must have had a difficult task in giving the awards. Mr. Sydney T. Spalding, Avenue House, South Darenth, Kent, was placed 1st, and Mrs. Helen Butt, 16, Gwendwr Road, West Kensington, 2nd.

For three stands or vases of flowers and foliage suitable for dinner table (open), Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, was placed 1st, with the now familiar floral arches; Mr. A. Larke, 14, Kensington High Street, was 2nd; and Mr. Walter Mole, 22, High Street, Hemel Hempstead, 3rd.

Miss Foden, Martow, Hemel Hempstead, was 1st for a single stand of flowers for the same purpose; Mr. W. Brown, St. Mary's Grove Nursery, Richmond, 2nd; and 3rd, Mr. A. Larke, Kensington High Street.

For a single stand of wild flowers, Miss Nellie Owen, High Street, Basingstoke, took the palm, with an arrangement consisting for the most part of grasses; Miss Lilian Hudson, Gunnersbury House, Acton, 2nd; and Mr. Dick Radclyffe, 129, High Holborn, 3rd, with blue *Cornflowers* and grasses only. There was extensive competition in all the classes of this section, but in each class the same exhibitors were mostly successful. For three bouquets, one bride's and two bridesmaid's, Messrs. Perkins & Son, Coventry, were 1st, and showed a very charming bouquet of *Eucharis*, *Odontoglossum*, *Roses*, *Stephanotis*, *Pantratiams*, &c., as the bride's; and the two for the maids, being composed wholly of pink *Carnations*; Mr. St. Leger, 16, Brook Street, New Bond Street, 2nd; and Mr. A. Larke, 14, Kensington High Street, 3rd.

Messrs. Perkins & Son were again 1st for one bouquet, and also for three bouquets (for a ball); with Mr. W. Brown, St. Mary's Grove Nursery, Richmond, 2nd.

For six buttonhole bouquets, Messrs. Perkins again secured premier position; Messrs. Lilian Hudson 2nd; and Mr. Geo. Mount, Canterbury, 3rd. The same firm were again 1st for three ladies sprays, Messrs. Baines, South Kensington, 2nd, and Mr. Geo. Mount, 3rd. For the best-arranged basket of cut flowers, Messrs. Perkins & Son carried the palm; Miss Foden, Hemel Hempstead, came 2nd, and Mr. St. Leger, 3rd. In this class there were eleven competitors.

Mr. W. Brown, Richmond, was 1st for a bouquet of natural grasses and Ferns; Messrs. Perkins & Son, 2nd, and Miss Foden, 3rd. For six plants suitable for table decoration in 6-inch pots, amateurs, E. H. Coates, Esq., Birtwood, Catterham (gr. C. Lane), was 1st; W. N. Froy, Esq., Ripon House, Putney Heath, 2nd; and the Earl of Dysart, 3rd. Mrs. Margaret Hodgkin, 5, Beaufort Avenue, Bidsbury, Manchester, received a Gold Medal for a collection of skeletonised leaves, &c.; and Miss Ada Stanley, Epworth, Lincoln, a Bronze Medal.

MISCELLANEOUS.

In the class for a group of *Begonias* (double and single), arranged with suitable foliage plants for effect, space not to exceed 150 square feet, the 1st prize was awarded to Mr. Thos. Ware, Hale Farm Nurseries, Tottenham, for a tastefully-arranged collection; whilst Messrs. Laing & Son, Forest Hill, were 2nd, with a group of magnificently grown plants, which had the disadvantage of being staged in a less favourable position than that of the more successful exhibitor.

Messrs. Laing & Sons were 1st for a group of foliage *Begonias* (open), and Mr. Thos. Ware was 1st for a collection of hardy herbaceous and bulbous perennials arranged in bunches (nurserymen), who staged a very beautiful collection of *Lilaea* in variety, *Delphiniums*, *Iceland Poppies*, &c., and a very fine spike of the pretty *Eremurus Bergii*. Messrs. Barr & Son, Covent Garden, were 2nd with a lot also possessing much merit.

For eighteen bunches of hardy herbaceous and bulbous perennials, distinct (amateurs), the Earl of Dysart, Ham House, Richmond (gr. Mr. Sage), was 1st; and H. Berkeley James, Esq., The Oaks, Carshalton (gr. Jas. Gibson), was 1st for twelve bunches; and John Watson, Esq., Reigate, Surrey, was 2nd.

NON-COMPETITIVE.

Amongst the non-competing exhibits was an immense group of *Roses*, both plants and cut blooms in great variety from Messrs. Wm. Paul & Sons,

Waltham Cross, which will be continued until the 16th inst., and which received a Gold Medal.

Messrs. Sander & Co., St. Albans, had a very charming collection of rare and valuable Orchids, including a large number of excellent varieties of *Odontoglossum vexillarium*, many of which received First-class Certificates; also a plant bearing a good spike of *Oncidium Dubneri*, *Vanda Hookeriana*, and *V. Sanderiana*; *Cattleya Leopoldi* var. *Lauchiana* (First-class Certificate), *Aërides Sanderianum*, a number of *Masdevallias*, and the pretty *Odontoglossum hastilabium*, beside a number of cut spikes of *Epidendrum vitellinum majus*. (Gold Medal.)

Messrs. Wills & Seagar showed a group of large Palms, similar to those shown at the last exhibition, and occupying the further ends of both annexes. These added much to the general effect of the exhibition.

Messrs. Cannell & Sons had a stand of *Begonias* (double), including the pink *Rosebud*; Mr. L. Castle, that very fine *Camellia*-like variety; and many others. They were shown in bunches among *Adiantum Fern*, and had a very pleasing effect. (Silver-gilt Medal.)

Messrs. John Laing & Son had a collection of *Roses*, also a group of cut flowers (hardy). (Silver-gilt Medal.)

Messrs. E. Shuttleworth and Co., Albert Nurseries, Peckham Rye, had a group of tastefully arranged stove and greenhouse plants in the centre of the annexe between the various tables in the decorative competition. (A Silver Medal.)

A Silver-gilt Medal was awarded to Mr. El. Pynaert van Geert, Ghent, Belgium, for a very fine and healthy specimen of *Sobralia macrantha nana*, some 6 feet in diameter, and just commencing to flower.

Mr. Alfred Smith, Downley, near High Wycombe, had cut *Roses*, *Pansies*, *Violas*, and *Pinks*. (Bronze Medal.) Messrs. Wm. Cuthbush & Son had a stand of foliage plants, *Bertolonias*, *Sarracenias*, &c., for which they received a Bronze Medal.

Messrs. Kelway & Son, Langport, Somersetshire, showed a very fine collection of *Delphiniums*, containing many new varieties: James Kelway is a large double flower, of purplish-blue, with a centre nearly white. (First-class Certificate.) *Utah*, another very large purple flower, was also similarly recognised. This same firm had a group of hardy cut flowers in rich variety. (Silver-gilt Medal.)

Messrs. B. S. Williams continue their show in the insectivorous-house, where they have a number of very interesting plants, including groups of *Orchids*, *Nepenthes*, *Sarracenias*, *Ouvirandra finestralis* (the Madagascar lattice-leaved plant), *Dionæa Muscipala* (*Venus' Fly-trap*), some *Bertolonias*, and many other such-like rarities.

FRUIT.

Very probably the general election, the which has everywhere filled country houses and kept gardeners actively engaged, tended to limit the supply of fruit on exhibition. In the two classes for collections, there was but one competitor in each. The one for twelve dishes was however very worthy a 1st prize, for Mr. Robins, gr. to Col. Lee, Aylesbury, who had very nice black Hamburg and Buckland Sweetwater Grapes, *Violette Hative* and *Diamond Peaches*, *Rivers' Early Orange*, and *Spencer Nectarines*, *Melon*, *Cherries*, &c. In the class for six dishes, Mr. Ocock, gr. to Mrs. Mackintosh, Romford, had fairly good black and white Grapes, *Bellegarde Peaches*, *Pineapple*, *Nectarines*, *Melon*, and *Jas. Veitch Strawberries*.

Grapes.—The best three bunches of blacks came from Mr. Thompson, gr. to Messrs. W. & E. Wells, Hounslow, and were really fine examples of *Madresfield Court*. Mr. Jas. Taverner (gr. to Sir A. Macdonald, Liphook), was 2nd with *Hamburgs*; and Mr. Bowerman (gr. to C. Hoare, Esq.), Hackwood Park, was 3rd with same variety.

In the class for three whites, Mr. Bowerman was 1st with excellent *Buckland Sweetwater*, finely berried and coloured. Mr. Osman (gr. to J. L. Baker, Esq., Chertsey) was 2nd with fine but unripe *Muscats*; and Mr. Thompson was 3rd.

Mr. Bowerman was again 1st in the single bunch class for whites, with a very fine sample of *Buckland Sweetwater*; and in the class for blacks, Mr. Thompson was a good 1st, with a superb bunch of *Madresfield Court*.

Peaches were good, especially the superb pair of dishes from Mr. Divers, Ketton Hall Gardens, who had beautifully coloured and large fruits of *Royal George* and *Stirling Castle*; Mr. Ocock came 2nd

with the former and *Bellegarde*. Mr. Robins had the best pair of dishes of *Nectarines*, in wonderfully-fine and richly coloured fruits of *Spencer* and *Stanwick Elruge*; Mr. Blair, of *Trentham Gardens*, being 2nd.

There were two classes for *Strawberries*. In the first, for three dishes, distinct, Mr. Gibson, gr. to Burnaby Atkins, Esq., Halstead, was 1st, with fine *Sir J. Paxton*, *Noble*, and *Auguste Nicaise*. Mr. Sage, Ham House Gardens, was 2nd, with very good *Sir C. Napier*, *Dr. Hogg*, and *Premier*.

In the single-dish class, Mr. Divers was placed 1st, with a very large sample of *Lateau of All*; *Dr. Hogg* and *Jas. Veitch*, both fine samples, followed.

Melons were not largely shown, but a rather small fruit of *Countess*, from Mr. Divers, was a good 1st, as it was delicious. Mr. Coomber, *The Hendre*, *Monmouth*, came 2nd, with *Blenheim Orange*; and Mr. Bowerman, 3rd, with *Countess* again.

Mr. Coomber was a good 1st for single *Pine*, a superb *Queen*; and Mr. Slade, *The Gardens*, *Clumber*, *Notts*, was 2nd, with a very fair fruit.

Miscellaneous.—A Silver Medal was awarded to Mr. Allan, gr. to Lord Suffield, Gunton Park, for seven boxes of fine *Strawberries*, including his new varieties, *Empress of India*, *Lord Suffield*, and *Gunton Park*, the latter a huge finely-coloured tallish variety, of capital flavour, which on this occasion received an Award of Merit. A Silver Medal also was awarded to Messrs. Wm. E. Wells, for a basket of very fine *Madresfield Court Grapes*; and a Bronze Medal to Mr. Sharpe, *Virginia Water*, for some fifty punnets of fine *Strawberry Sir C. Napier*.

There were two sets of three dishes of *Tomatoes* shown, the finest being *Perfection*, *Conference*, and *Ham Green Favourite*, from Mr. Sage; and Mr. Poidevia, *Guernsey*, had *Perfection*, and two coarsely-cultured varieties.

A 1st prize was awarded to three monster bunches of *Bananas*, shown by Messrs. Parsons & Bourgaire, *Covent Garden*, who in the class for collections of British or Channel Islands fruit, to show excellence in packing for transit, were also 1st. They had a Gold Medal awarded. The collection comprised twenty-seven cross-handle baskets of fine *Melons*, *Black Hamburg*, *Alicante*, and *Muscats* of *Alexandria Grapes*, *Peaches*, *Figs*, *Tomatoes*, &c. Mr. Poidevia was 2nd, with a smaller collection, obtaining a Silver-gilt Medal. Messrs. Parsons & Bourgaire had the best "shallow" of *Grapes*, fine *Muscats* admirably packed with red tissue-paper. A good basket of *Madresfield Court* was placed 3rd only, as the packing was not meritorious. The market classes, which were an after-thought, were indifferently filled, probably because not sufficiently known.

IPSWICH AND EAST OF ENGLAND HORTICULTURAL.

JUNE 29.—The annual summer show of the above was held in Christchurch Park, and the date of the show being somewhat earlier than usual, there was a considerable falling off in the number of entries, although in point of excellence nothing better could be desired.

The exhibits were arranged in two marquees—cut flowers and pot plants in one, fruit and vegetables in the other. A novel form of advertising the event, the decoration of "sandwich-boys" with large *Roses*, which were supplied by Mr. Prince, of Oxford.

There was a fair number of entries in nearly all the sixty-seven classes, only one or two producing no competition. In the sixteen classes of pot plants there was a spirited contest, many magnificent specimens being shown. Here Mr. C. Whitfield King, *Morpeth House*, *Lacey Street*, *Ipswich*, carried off premier honours, winning no fewer than eight prizes. His collection all round was fine. His four *Orchids* which took a prize were *Dendrobium thyrsoiflorum*, *Epidendrum vitellinum majus*, *Cattleya Harrisonæ*, and *Odontoglossum cordatum*. Mr. King's specimen *Orchid* was an *Aëridea odoratum*; and his *Orchids* in the group included *Dendrobium thyrsoiflorum*, *D. densiflorum*, *D. chrysotoxum superbum*, and *D. Dalhousianum*; *Lælia purpurata*, *Cattleya labiata Warneri*, *C. Mossia*, *Odontoglossum Alexandræ*, *O. maculatum*, *O. pulchellum*, and *O. Pescatorei*; *Oncidium ampliatum majus*, and *Aërides odoratum*.

The competition for the best group of plants arranged for effect was keen, and some excellent collections were shown. The cut flowers were by far the most attractive feature of the show. There was a splendid array of *Roses*, considering the unfavourable weather. In the open classes, Mr. F.

Cant, *Colchester*, came to the front with some fine specimens; and in the amateur classes, Rev. H. A. Berners was very successful. He won the Silver Medal of the National Rose Society for the best *Tea Rose* with *Cleopatra*; while the Medal offered by the same Society for the best hybrid was taken by Mr. O. G. Orpen with an *A. K. Williams*. There was a large entry in the classes for herbaceous flowers. Mr. Gilbert, Messrs. Paul & Son, and Mr. R. C. Notcutt's collections were remarkable alike for number and variety of colour.

A special prize for the best table decoration was won by the Misses Wrinch and Steines, of *Hill Crest*, *Ipswich*, with a pretty exhibit of *Roses* and *Maidenhair Ferns*.

There was a fair show of fruit, including some fine *Grapes*. *Strawberries* formed by far the most numerous exhibit.

The vegetable classes did not seem to be up to their usual standard, either in quality or number. The following was the prize list:—

Pot Plants.—Four foliage plants, Mr. George Gilbert, *Floral Nurseries*, *Ipswich*. Group of plants arranged for effect, Mr. C. W. King. Specimen foliage plant (amateurs), Mr. C. W. King. Six single tuberous *Begonias*, Mr. R. C. Notcutt, *Broughton Road Nursery*, *Ipswich*. Six double *Begonias*, Rev. H. A. Berners, *Harkstead Rectory* (gr., G. Jordan). Six *Gloxinias*, Mr. R. C. Notcutt. Four *Coleus*, Mrs. A. F. Nicholson. Six plants for table decoration, Mr. W. Beer, 31, *Spring Road*, *Ipswich*. Four *Orchids*, Mr. C. W. King. Specimen *Orchid*, Mr. C. W. King. Pot of *Liliums*, Mr. C. W. King. Hanging basket of plants, Mr. C. W. King. Hanging basket of *Ferns*, Mrs. A. F. Nicholson. Group of plants, arranged for effect (market gardeners and allotment holders only), Mr. W. Beer.

Cut Flowers.—Forty-eight *Roses*, single trusses, distinct (open), Mr. F. Cant, *Braiswick Nursery*, *Colchester*; 2nd, Mr. B. R. Cant, *Colchester*.

Thirty-six ditto (open), Messrs. D. Prior & Sons, *Myland Nursery*, *Colchester*; 2nd, Messrs. J. Burrell & Co., *Howe Nursery*, *Cambridge*. Twelve *Roses*, distinct, three trusses of each (open), Mr. F. Cant; 2nd, Mr. B. R. Cant. Eighteen *Roses*, *Tea* and *Noisette*, distinct (open), Mr. F. Cant; 2nd, Mr. G. Prince. Thirty-six *Roses*, distinct, single trusses (amateurs), Rev. H. A. Berners; twenty-four *Roses*, single trusses (amateurs), Mr. J. Gurney Fowler, *Woodford* (gr., J. Davis); 2nd, Mr. O. G. Orpen, *West Bergholt*. Twelve *Roses*, distinct, single trusses (amateurs), Mr. J. Gurney Fowler; 2nd, Mr. O. G. Orpen. Eighteen *Roses*, *Tea* and *Noisette*, distinct, single trusses (amateurs), Rev. F. Burnside, *Birch Vicarage*, *Hareford*; 2nd, Rev. H. A. Berners. Twelve ditto, *Tea* and *Noisette*, distinct, three trusses of each (amateurs), Rev. H. A. Berners; 2nd, Rev. F. R. Burnside. Twelve *Roses* of any variety (amateurs), Rev. A. Foster Melliar; 2nd, Mr. J. Gurney Fowler. Collection of herbaceous flowers in bunches, Mr. George Gilbert; 2nd, Messrs. Paul & Son, the *Old Nurseries*, *Cheshunt*. Twenty-four herbaceous flowers, Messrs. J. Burrell & Co.; 2nd, Mr. C. Jacobi, *Henley Road*, *Ipswich*. Six herbaceous flowers (amateurs), Mr. O. G. Orpen. Twelve zonal *Geraniums*, Mr. F. Buckingham; 2nd, Mr. R. Austin, sen. Twelve *Roses* (market gardeners and allotment holders), Mr. C. Jacobi. Six zonal *Geraniums* (market gardeners and allotment holders only), Mr. R. Austin, sen.

Fruit.—Collections of fruit (six distinct varieties), Hon. W. Lowther; three bunches of black *Grapes* (open), Hon. W. Lowther; three ditto, white (open), Mr. C. W. King. Six *Peaches* (open), Hon. W. Lowther. Six *Nectarines* (open), Hon. W. Lowther. One *Melon*, *Lord Rendlesham*; 2nd, Hon. W. Lowther. Dish of black *Cherries* (open), Mr. R. Austin, sen., *St. John's*, *Ipswich*; ditto, white (open) no 1st; 2nd, Mr. F. Buckingham. Forty *Strawberries* for flavour (open), Mr. R. Austin, sen. Best collection of *Strawberries*, six varieties (open), Mr. J. Woods, *The Nurseries*, *Woodbridge* (gr., W. Morse).

Vegetables.—Collection of vegetables, six distinct varieties, the produce of seed supplied by Messrs. Sutton & Sons, Hon. W. Lowther. Collection of vegetables, six distinct kinds, including two of Messrs. Webb's varieties from seed supplied direct by them in 1892, Hon. W. Lowther. Brace of *Cucumbers* (amateurs), Mr. G. W. Charters. Nine round *Potatoes* (open), Hon. W. Lowther. Nine kidney ditto (open), Major Howey. Three *Cauliflowers*, Major Howey.

SEEDS.

LONDON: July 6.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market presented quite an idle appearance. Actual sowing requirements are just now at a minimum, and no speculation whatever has sprung up. Some American Red Clover seed lying in London has been taken for reshipment to New York. The new French Trifolium comes good and cheap. White Mustard seed hardens in value; choice qualities are now in narrow compass. Rape-seed keeps strong. For Haricot Beans there is a rather better request. Canadian Blue Peas are being bought to be sent back to America. In Canary seed the tendency continues upwards. Hempseed sells slowly. There is no alteration in either Buckwheat, Duri, or Millet.

FRUITS AND VEGETABLES.

SPITALFIELDS, July 5.—Quotations:—Cabbages, 2s. 9d. to 5s. 6d. per tally; Greens, 1s. 6d. to 2s.; Turnips, 2s. 6d. to 3s.; Carrots, 2s. to 2s. 8d.; Spring Onions, 3s. to 4s.; Parsley, 1s. to 2s. per dozen bunches; Cauliflowers, 1s. 6d. to 2s.; Cabbage Lettuce, 4d. to 6d.; frame Cucumbers, 1s. 6d. to 2s. 6d.; natural do., 1s. to 1s. 3d. per doz.; Peas, 3s. to 5s. per bushel; Cos Lettuce, 4d. to 6d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Horseradish, 1s. to 1s. 1d. per bundle; New Zealand Apples, 5s. to 8s. per box; foreign Tomatos, 1s. to 1s. 6d. per box; Gooseberries, 2s. 6d. to 3s. 3d.; Black Currants, 8s. 6d. to 10s. per half-sieve; Strawberries, 2s. to 4s. per peck.

BOROUGH, July 5.—Quotations:—Cauliflowers, 2s. 6d. to 4s. per dozen; Cabbages, 4s. to 5s. per tally; Peas, 2s. 6d. to 3s. per bushel; Spinach, 1s. 3d. to 2s. 6d. per bushel; Greas, 2s.; new Carrots, 3s. 6d. to 4s.; Spring Onions, 4s. to 6s. per dozen bunches; Egyptian do., 4s. to 5s. per cwt.; English Apples, 5s. to 10s. per bushel; Canadian do., 12s. to 20s. per barrel.

STRATFORD, July 5.—There has been a good supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned quotations:—Cabbages, 2s. 6d. to 6s. per tally; Greens, 1s. 6d. to 2s. per bag; Turnips, 2s. to 3s. per dozen bundles; Carrots, household, 1s. to 3s. do.; Mangolds, 16s. to 22s. per ton; Green Peas, 5s. 6d. to 7s. 6d. per bag; Onions, Egyptian, 80s. to 100s. per ton; Apples, Tasmanian, 6s. to 7s. 6d. per case; Cucumbers, 2s. to 4s. per dozen; do., Dutch field, 1s. 6d. to 2s. 3d.

do.; Strawberries, 2s. 3d. to 3s. 2d. per peck; Gooseberries, 2s. to 3s. per half-sieve; do., 4s. to 5s. per flat; Tomatos, 10s. to 12s. per case.

FARRINGTON, July 7.—Quotations: New:—Jersey Flukes, £5 to £5 10s.; do., Kidneys, £5 10s. to £5; do., Rounds, 90s. to 100s. per ton.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending July 2, is furnished for the Meteorological Office:—

"The weather during this week was very changeable. At first it was fair except in the extreme west and north, but late on Tuesday a severe thunderstorm was experienced in many parts of England, and the rainfall accompanying it was very heavy in the north-east and north-west. Fair conditions subsequently prevailed over the greater part of England, but in Ireland and Scotland, the weather became unsettled, and rainy, especially on Saturday.

"The temperature did not differ materially from the mean over England and Ireland, but was a little below it in Scotland. The highest of the maxima were recorded on the 27th, and ranged from 83° in 'England, S.' and the 'Channel Islands,' and from 81° in 'England, E.' to 70° in 'Scotland, E.,' and 67° in 'Scotland, N. and W.' The lowest of the

minima, which occurred on the 29th at the Scotch stations, and on the following day elsewhere, varied from 36° in 'Scotland, N.,' 37° in 'Scotland, E.' and the 'Midland Counties,' and 38° in 'England, E. and S.W.,' to 45° in 'England, N.E.,' and 51° in the 'Channel Islands.' After the thunderstorm on Tuesday evening the fall of temperature over England was very rapid.

"The rainfall differed very considerably in the various parts of the Kingdom. In most of the English districts, in 'Scotland, N. and W.,' and over 'Ireland' it exceeded the mean, but in 'England, S. and S.W.,' the 'Channel Islands,' and 'Scotland, E.,' it was less than the normal. At some of the northern English stations the amounts measured on the morning of the 29th ranged from 1.5 inches to 2.0 inches.

"The bright sunshine exceeded the normal in most places, but showed a deficit in the north-western and south-western districts. The percentage of the possible duration ranged from 30 in 'England, N.W.,' and 32 in 'Scotland, N.,' to 48 in 'England, E.,' 56 in 'England, S.,' and to 62 in the 'Channel Islands.'"

NOTICES TO CORRESPONDENTS.

* PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We have been pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

BLIGHT ON ROSE: J. N. L. The Orange Rust, Coleosporium pingue, figured in the *Gardeners' Chronicle*, July 17, 1886.

BOOK: J. S. *How Crops Grow*, McMillan.

CARNATION: A. J. Z. The Carnation Rust, often figured and described in these columns. Burn the affected plants.

DISEASED GRAPES: K. J. The berries are affected with the so-called spot, which is caused by a fungus, *Glaeosporium laticolor* (see *Gardeners' Chronicle* for December 6, 1890, for figures and description). The application of some of the recommended fungicides at an early date after the berries are formed would probably arrest its spreading; but once it has made its appearance, there remains nothing but the removal of the spotted berries, which should be burnt at once.

GARDENERS' BOOKS: T. Simpson, *Handy Book of the Flower Garden*, D. Thomson, 4th edition (Blackwood & Sons); *Choice Stove and Greenhouse Plants*, 3rd edition (B. S. Williams); *Select Ferns and Lycopods*, 2nd edition (B. S. Williams); *Domestic Floriculture*, 2nd edition (by F. W. Burbidge); *Manual of Conifers* (J. H. Veitch, Royal Exotic Nursery, Chelsea); *Artificial Manures* (M. Ville), translated by Crookes, Longman & Co.; *Dictionary of Gardening* (Nicholson), Upcott Gill, 70, Strand, London; *Vines and Vine Culture* (A. F. Barron, Chiswick); *British Flora* (Bentham & Hooker); *Manual of Orchidaceous Plants* (H. J. Veitch, Exotic Nursery); *The Forester* (Jas Brown), Blackwood & Sons; *Thompson's Gardeners' Assistant* (Blackie & Sons); *Apple Conference Report*, Royal Horticultural Society, Chiswick; *Manual of Injurious Insects and Methods of Prevention* (E. A. Ormerod), 2nd edition, Simpkin, Marshall, Hamilton, Kent, & Co., London; *The Vegetable Garden* (Vilmorin), English edition, John Murray, Albemarle Street, London.

GARDEN LABOUR: D. D. The staff seems to be much under the requirements of the place; it just sufficing for the efficient cultivation of the 3½ acres of walled-in kitchen garden.

HORTICULTURAL AND OTHER JOURNALS: H. A. *Illustrierte Wiener Gartenflora*, Editor, Ritter Beck von Managhetta. Published in Vienna. In St. Petersburg the following are published:—*The Weekly Messenger for Gardening, Fruit and Vegetable Culture*: Organ of the Russian Horticultural Society. Subscription, post-free, 30s. *Journal of Agriculture and Forestry* (monthly). Subscription, post-free, 16s. It is one of the publications of the Russian Board of Agriculture.

INSECTS ON ABIES NORDMANNIANA: Jas. H. W. F. Your young shoots of *Picea Nordmanniana*, sent on June 13, are infested by a minute aphid (all dead and shrivelled up). The plants should have been syringed with gas tar water, and soap-suds—if not too late it would be well to cut off and burn the infested twigs. I. O. W.

INSECTS: *I. J. F.* The small aphid covered with white powder on your *Picea Nordmaniana* may be syringed with gas-tar water and soft-soap suds, or with other fluid as directed in our recent article on syringing, its material, and mode of application. Quassia and tobacco-water, are also beneficial. It is curious that the insect does not touch *A. nobilis*, *A. grandis*, or *A. lasiocarpa*. *I. O. W.*

MALFORMED ASPARAGUS: *W. O.* This fasciation of the stem is a very common occurrence in highly manured beds, but in your case the stem has been bent by its coming in contact with an underground obstruction, or from an injury to the skin on one side, which did not grow so fast afterwards—and therefore it had pulled as it were the stem on that side, and caused the curve noticed.

NAMES OF PLANTS: *Yagabond.* *Orchis conopsea*, paler, sweet-scented flowers; *Orchis pyramidalis*, with darker scentless flowers, arranged in a conical spike; *Lotus corniculatus*, depauperate variety.—*T. M., Plympton.* *Melilotus officinalis*.—*J. G.* The one-leaved variety of the common Ash, *Fraxinus europæa* var. *monophylla*.—*H. E. 1.* *Dianthus caryophyllus*; 2, *Veronica prostrata*.—*Byfield.* 1, *Veronica chamædrys*.—*R. Smith.* *Glaadiolus Byzantinus*; a poor specimen.—*A. A.* *Saccolabium guttatum*.—*F. A. G. 1.* *Agrostemma coronaria*; 2, *Pellionia pulcher*.—*F. Miller & Co.* *Iris ochroleuca*.—*T. C.* *Ligustrum*; cannot name from such imperfect material. Send good fresh material in damp moss (in flower).

NEW EUCHARIS: *G. C.* Some of the nurserymen would probably be glad to give you a good price for it.

NOTICE TO QUIT: *Birmingham.* In the absence of any agreement, the tenancy is regarded as annual, and can only be terminated by the tenant giving a six-months' notice to the landlord, expiring on the same day the tenancy commenced.

PHYLLOXERA: *Exeter.* Yes, certainly; lose no time in extirpating the Vines, remove all the soil, burn it with sulphur, and burn sulphur in the house.

POTATO INSECT: *T. M.* An aphid, not the Colorado beetle.

PROLIFEROUS ROSE: *R. W. A. W.* Not uncommon in some seasons. The growth after the formation of the flower, &c., should be arrested; but for some reason we cannot tell in your case, it has started again.

PYRETHRUM: *Mrs. C.* A "hen and chicken" sport, not very unusual to those who look out for such sports. Possibly it might come again from seed, if you think it worth while to try.

ROSE PERFUME: *Joseph Ellison.* The following method is that practised by the London perfumers when preserving the Mitcham-grown Roses for future use. According to Mr. Pierson in his book *The Art of Perfumery*, the leaves are separated from the stalks, and to every bushel of flowers, equal to about 6 lb. weight, 1 lb. of common salt is thoroughly rubbed in. The salt absorbs the water existing in the petals, and rapidly becomes brine, reducing the whole to a pasty mass, which is finally stowed away in casks. In this way they will keep almost any length of time without the fragrance being seriously injured. We should think this would be the best course you could pursue.

STRAWBERRY RUNNERS: *British Queen.* The first and second runners are, of course, the best, and the weaker ones may, or may not, be blind; at any rate, blindness is to be feared, and such runners should not be employed for forced Strawberries, or for planting beds that are required to bear fruit within the first year after planting.

VINES IN SPANISH HONDURAS: *Henry the Norman* is not likely to do any good with the Vine; but, tropical products such as Caoutchouc, Vanilla, Cocoa, Cocoa-nuts, Coffee, Pine-apples, &c., might be tried. Without knowing the local circumstances and requirements, the available markets, &c., no information we can give would be of much avail.

VINES WITH WARTY LEAVES: *An Amateur, Erdington.* We should like to see some more leaves, and a handful of the roots from the worst-looking Vine, before answering your inquiries.

COMMUNICATIONS RECEIVED.—*H. E. Milner.*—*H. B. S.*—*S. G. F.*—*A. D.*—*R. P.*—*E. J. L.*—*H. W. W.*—*H. G.*—*H. E.*—*M. T.*—*H. Evershed.*—*Dr. F. K.*—*C. D. O.* (with thanks).—*Sir A. M.*—*C. B. L. The GREATEST NOVELTY of the AGE!

SAM DEARDS' PATENT SELF-WATERING SHELF FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

- ITS ADVANTAGES ARE—**
- 1st.—No waste of water, all water being absorbed by the plants.
 - 2nd.—Saving of three-fourths of the labour in watering.
 - 3rd.—The plants are watered more naturally than by any other method.
 - 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
 - 5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
 - 6th.—A boy can do the work of a man.
 - 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

JOURNEYMAN, in the Houses.—Age 19; five years' experience. Good character. Bothy preferred.—E. B., 26, Denyer Street, Marlboro' Road, Chelsea, S.W.

JOURNEYMAN, in a Gentleman's Garden, Inside or Inside and Out.—Age 20; five years' experience; good character.—T. JEFFRIES, The Gardens, Hildon House, Stockbridge, Hants.

IMPROVER, Inside and Out.—Age 18; two years' character, and two years' previous. Bothy preferred.—HEADGARDENER, Hedwelty Lodge, Tredegar, Mon.

IMPROVER, Inside, or Inside and Out, in Private Gardens.—Age 18. Two and a half years' good character. Bothy preferred.—A. DOWNES, Barkham, Alton, Hants.

IMPROVER.—Mr. WM. EATWELL, Burderop Park, Swindon, Gardener to Captain Calley, can thoroughly recommend a young man as Improver. Four years' good character.

IMPROVER, in the Houses.—Age 18; two years' good character. No bothy.—A. H., Watlington Park, Downham, Norfolk.

TO GARDENERS.—Wanted, by a YOUTH (age 19), a situation in a Gentleman's Garden. Good character. Premium if required. Four years' experience.—A. BOOKER, 59, Ringford Road, Wandsworth, S.W.

TO NURSERYMEN, &c.—Situation wanted by a young Man, age 27, Inside or Inside and Out. Six years' in last situation.—GEO. BOON, Thorncombe, Chard.

GARDENERS' HANDYMAN wants work. Painter, Glazier. Willing to fill up time at anything useful. Job not objected to. Any district. Own tools.—G., 55, Stockwell Green.

HOLLOWAY'S OINTMENT and PILLS.—Shortness of Breath, Coughs, and Colds.—Thousands of testimonials can be produced to prove the power possessed by these corrective remedies in case of asthma, incipient consumption, and all disorders of the chest and lungs. The Ointment, well rubbed upon the chest and back, penetrating the skin, is absorbed and carried directly to the lungs, where, in immediate contact with the whole mass of circulating blood, it neutralises or expels those impurities, which are the foundation of consumption, asthma, bronchitis, pneumonia, and similar complaints. On the appearance of the first consumptive symptoms, the back and chest of the patient should be fomented with warm brine, dried with a coarse cloth, and Holloway's Ointment then well rubbed in. Its absorption will subdue advancing symptoms, and baffle this formidable foe.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work around them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

Manufactured under 30 James Keith's Patents in Great Britain, United States, and Canada.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hood, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S "PYTHON" BOILER, as illustrated, has 1,000 square feet of effective heating-surface, with 17½ square feet of fire-grate area, heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

SALES BY AUCTION.

Friday Next.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. SANDER to **SELL BY AUCTION**, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT**, July 22, at half-past 12 o'clock, a fine lot of the new and exquisite

CATTLEYA VICTORIA REGINA.

Also a fine lot of

CATTLEYA ALEXANDRÆ.

A new and most distinct **CYRTOPODIUM**,
CYRTOPODIUM SUAVISSIMUM.

The New White Sobralia,

SOBRALIA IMPERATRIS,

A grand Lot of **DENDROBIUM NOBILE**, the Upper Burmah variety.

CYPRIPEDIUM HIMALAICUM.

A New and striking EPIDENDRUM.

PHAIUS TUBERCULOSUS and **PHAIUS HUMBLOTTII**; a small but good importation of these lovely plants.

CYPRIPEDIUM NIVEUM, a very fine lot, just to hand.

And many other choice and useful ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.—Zamias.—Important Consignment.

MESSRS. PROTHEROE AND MORRIS desire to announce that they have received a consignment of 31 trunks of **MACROZAMIA SPIRALIS**, several being 6 feet in circumference, 121 **MACROZAMIA CARALLIPES**, 11 **XANTHAREA HASTILIS**, and 1570 seeds of **MACROZAMIA SPIRALIS**. The importation is the grandest ever received (the whole being in splendid condition), and will be **SOLD ON FRIDAY NEXT**, July 22.

Auction Rooms and Estate Offices, 67 and 68, Cheapside, E.C.

Lower Norwood.

IMPORTANT UNRESERVED SALE of the well-known and valuable collection of **EXHIBITION STOVE** and **GREENHOUSE PLANTS**, which have been so successfully shown for many years at the leading London and provincial shows by order of Mr. HENRY JAMES, who is giving up exhibiting.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION**, on the Premises, The Castle Nursery, Lower Norwood, on **THURSDAY NEXT**, July 21, at 12 o'clock, the valuable collection of **EXHIBITION STOVE** and **GREENHOUSE PLANTS**, comprising well-grown specimen Kentias and other Palms, Stephanotis, a fine lot of Agapanthus albus, coming into flower; splendid specimen Heaths, 6 to 8 feet through; Allamandas Hendersonii, Cathartica, grandiflora, and nobilis; Xoras, Ferns, 50 magnificent specimen Azaleas, probably the best collection in the country; fine examples of Crotons, Anthuriums (a specialty at this nursery), Chrysanthemums, and other plants.

May be viewed three days prior to the Sale.

Catalogues may be had of Mr. H. JAMES on the Premises, and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Streatham Hill.

A few minutes' walk from the Tulse Hill Railway Station.

UNRESERVED SALE.

By order of the Owner, who is leaving the neighbourhood.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION** on the premises, Hughenden, 19, Palace Road, Streatham Hill, S.W., on **Tuesday**, July 26, at one o'clock precisely, the whole of the **STOVE** and **GREENHOUSE PLANTS**, **CAMELLIAS**, and **AZALEAS**, **ASPIDISTRAS**, **PALMS** and **FERNS**, a few **ORCHIDS**, **CHRYSANTHEMUMS**; the erection of Three Greenhouses, Pits, Hot-water Piping, Boiler, Lawn Mower, Garden Tools, Pots, Ladders, Light Spring Bath Chair, and other effects.

On view day prior and morning of Sale. Catalogues may be obtained on the premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Stamford Hill. Without Reserve.

ABSOLUTE CLEARANCE SALE. By order of the Proprietor, who is going abroad, and relinquishing the Business.

IMPORTANT TO PALM GROWERS, DECORATIVE FLORISTS, and OTHERS.

MESSRS. PROTHEROE AND MORRIS will **SELL BY AUCTION** on the Premises, The Palm Nursery, 106, Stamford Hill, N., a few yards from the Stoke Newington Station, G. E. R., on **WEDNESDAY** and **THURSDAY**, July 27 and 28, at 12 o'clock precisely each day, without reserve, by order of Mr. W. Owen, the whole of the **STOCK-IN-TRADE**, comprising thousands of well-grown Palms in various sizes, particularly worthy of the attention of the Furnishing Trade and Private Buyers, including 100 Specimen *Lantana borbonica*, 500 fine plants of *Chamaecyparis excelsa*, 2½ feet to 5 feet; 100 *Cocos plumosa*, good plants; large quantities of *Senecioia elegans*, *Arca sapida*, *A. Baueri*, *Corypha australis*, *Phoenix reclinata* and *tenuis*, *Kentia Belmoreana* and *Fosteriana*, 1000 *Draecena congesta* discolor, and *rubra*, in 48-pots; 200 *D. indivisa*, small plants; *Aspidistra lurida variegata*. The erections of 6 Greenhouses, about 3500 feet of Hot-water Piping, mostly 1-inch; capital Steam Boiler, also 2 other Boilers, Flower-pots, Office, and other Effects.

May be viewed two days prior to the Sale. Catalogues may be obtained on the Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone.

N.B.—The Vendor has made arrangements for a large Marquee to be erected at the Nursery into which plants will be removed. The Sale will take place in this Marquee, which will afford ample accommodation for intending purchasers to view the plants, and avoid walking through the Greenhouses.

Arlesley, Bedfordshire.

On the main line of the Great Northern Railway, midway between Bedford and Baldock, and close to the ARLESEY Station, THE "WATERLOO" FARM, a Freehold and Title-free Estate of valuable Garden Land, containing 330a. Or. Op., and having an extensive frontage to the road from Arlesley Station to Stotford, let to Mr. Daniel at an annual rental of £975, to be **SOLD BY AUCTION**, at the "Sun Hotel," Hitchin, on **TUESDAY**, July 26, 1892, at 4.30 o'clock precisely, by

MR. J. R. EVE and **Mr. GEORGE JACKSON**, (who are jointly concerned).

The "WATERLOO" FARMHOUSE and **HOMESTEAD** and 250a. Or. Op. of **GRASS** and **ARABLE LAND** will be offered in One Lot, and the remainder in Eight Lots, to suit the convenience of purchasers.

Also, the "OLD OAK" PUBLICHOUSE, Garden and Paddock, within 200 yards of the Arlesley Station, and a Plot of **BUILDING LAND** adjoining, both now let to Mr. Page, of Ashwell Brewery, at the rental of £50 per annum.

The tenancies of the whole of the Estate will terminate at Michaelmas next.

Particulars and Plans can be obtained of Messrs. PRESS AND INSKIP, Solicitors, Bristol; of Mr. J. R. EVE, Bedford, Hitchin, and Luton; and of Mr. GEORGE JACKSON, Hitchin, Baldock, and Royston, Herts.

WANTED TO RENT, a PIECE OF GROUND with some GLASS, for Market Purposes. Apply, MATTHEWS, The Lodge, Aberdean Park, N.

FLORIST and NURSERY BUSINESS for DISPOSAL.—For further particulars, apply to—Mr. G. PAYNE, Florist, Highgate Hill, Holloway, London, N.

FOR SALE, a **FREEHOLD MARKET GARDEN PROPERTY**, with Greenhouses and Dwelling-house. Private treaty; going concern. Well situated for business; adjoining thriving town. Small capital. Apply to—WILLIAMS and NICHOLSON, Salop House, Oswestry.

To Nurserymen, Florists, &c.

SUBSTANTIAL NURSERY PREMISES, constructed at great cost (Leasehold—over 60 years to run), to be **DISPOSED OF**, by Executors, at a small nominal premium. The premises are in working order, and comprise Greenhouses, Dwelling-house, Gardener's Cottage, Stabling, &c.; about 6 miles from Covent Garden, London.

Particulars will be furnished upon application to A. Z., 2, Wisteria Road, Lewisham, S.E.

SEED BUSINESS, for Disposal.—Well situated, and near station in a city in the north of England. Terms moderate.—Apply, B. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO NURSERYMEN and FLORISTS.—To be LET, at Edmonton, an ACRE OF LAND, suitable for Nursery Purposes, adjoining Land Let to Florists. Rent moderate.—Particulars of Mr. ALFRED RICHARDS, Auctioneer, Lower Tottenham.

VERY CHOICE LILIUM HARRISII. 7 to 9 inches round, 6s. per doz.; 9 to 11 inches round, 10s. per doz. *Chionodoxa luciliae*, 3s. per 100; extra fine, 4s. 6d. per 100. *Elwes' Giant Snowdrop*, 4s. per 100; 35s. per 1000. Full List on application. ROBERT SYDENHAM, Roseleigh Birmingham.

WEBBS'

EMPEROR CABBAGE.

THE EARLIEST AND BEST.
6l. and 1s. per packet.
1s. 6d. per ounce.

From C. BOULT, Esq., Charvey Down.—"I planted out a bed of 200 plants of Emperor Cabbage at the end of September, and, wonderful to say, not a plant was injured by the winter weather, though they were in an exposed situation, neither did a plant 'start' to seed. I began to cut the heads quite a fortnight before my neighbours. I have tried many sorts, but Webbs' Emperor is by far the best Cabbage I ever grew."

THE

Gardeners' Chronicle.

SATURDAY, JULY 16, 1892.

LONGFORD CASTLE.

TO call at a garden when the bedding-out operations are in full swing and haycutting impending in the immediate future, is to tempt the Fates. Our visit to the Earl of Radnor's garden at Longford Castle, near Salisbury, was more one to a valued correspondent than one of inspection; consequently, much talk was indulged in, but no notes were taken, and the penny post has been relied on to fill up some of the deficiencies of imperfect memory.

The park commands fine views, and a clear river, beloved of the trout, rushes through it as if it had not a minute to lose, in order that it may keep its appointment with the sea at Christchurch, some 35 miles off. That portion of the demesne eastward of the Castle is flat to the extent of several hundred acres. The ground then rises somewhat sharply to a considerable height, forming an irregular but beautifully wooded background, and above the tree-tops is seen the tapering spire of St. Mary's Church, Alderbury, in the "Green Dragon" of which picturesquely-situated village, we may remark, *en passant*, Dickens' Martin Chuzzlewit is said to have refreshed the "inner man" when on his way to Salisbury. That portion westward of the Castle is beautifully undulated, with fine belts, and clumps of Chestnuts, &c., and charming vistas, with the spire of Salisbury Cathedral cutting the sky-line 3½ miles distant. The green sward is dotted with noble Beeches, and other trees, among which a glorious Pinus insignis, a handsome purple Beech, and a fine deciduous Cypress were specially noticed.

A scarlet Pavia affords an illustration of the results of root-pruning. Two trees of the same species and of the same age stand side by side, the one was towards the end of the year root-pruned, its companion was undisturbed. The one flowered freely the first year after the operation, whilst that in which Nature had her own way, has not flowered yet.

At a point formed a short distance from the "Rapids" by the confluence of the waters of the Avon and the "Etele" (the latter is an excellent trout-stream running through a different part of the grounds, and spanned by two iron bridges) is the "old garden." This is a green sward, protected on all sides excepting the south east, by high trees. On this sheltered piece of turf are a few beds of Moss and other Roses on their own roots, the shoots being pegged down, others having Irises, Lilium candidum, &c. Two fine old specimens of hardy Heath was so damaged by snow and frost last winter, that they had to be cut down to the ground, but being rapid growers, they are now forming nice-sized bushes again. Here also is another but smaller specimen of deciduous Cypress, aged Judas trees, producing their rosy purple flowers; hardy Ferneries close by, and two summer-houses, one

A Large General Collection of ROSES IN POTS, for Planting-out, Climbing, and Pot Culture, 9s. to 18s. per doz.; Extra Strong, 24s. to 42s. per dozen.

PAUL'S NURSERIES, WALTHAM CROSS, HERTS.

in the centre of the green, a "Robinson Crusoe Hat" in shape, open all round, with climbing Roses, Clematis, &c., trained up the rustic Oak pillars, and over the Heather-thatched roof, which, in spring, is brightened by a display of Crocuses and Snowdrops growing in 3-inch pots filled with soil, and then buried below the rims in the thatch; the other, composed of bricks and mortar, and having a tiled roof with artistically constructed Oak table and seats all round inside, being completely hidden under the spreading branches of an English Yew, of which other good specimens are to be found in other parts of the grounds, in which another summer-house, alcove in shape, was noticed. This was built in 1745, and is quite a feature in this part of the pleasaunces. Borders of hardy Ferns are on either side the walks leading to this summer retreat. New and winding gravel-walks have been made here during the past winter which, connecting as they do, the walks in the new (15 acre) portion of the grounds with those in the interior of the "old garden," &c., add greatly to the beauty of the place, and the comfort and convenience of seeing over it.

Many improvements have been made in the gardens at Longford during the last three years, including two herbaceous borders 100 yards long, and 3 yards wide each, and which in due time (as they were only planted last March) will render a good account of themselves, and add a new feature to the floral department at Longford.

In front of the castle is the principal flower garden—formal and precise with geometrical beds, and bounded by closely-clipped hedges. Of course, this is all heresy to some people, and we should be of the same opinion perhaps, if it were anywhere else but on the terrace adjoining the mansion. Here it is quite appropriate, and is in substance part of the architectural scheme. Violas and Carnations, Pelargoniums, and the usual occupants of these gay beds are employed in great numbers, and arranged with such skill and judgment that harmony is not, as it often is, sacrificed to mere brilliancy. The bedding Violas were unusually fine in size and colour; the Wiltshire climate is no less propitious to them than the Scottish. Pelargoniums *Henri Jacobi* (crimson), the good old Tom Thumb (scarlet), Master Christine (pink), Leamington Lass (semi-double, pink), together with the silvery-foliaged *Manglesi*, *Bijou*, the golden-tricolored *Mrs. Pollock*, golden-bronze *Robert Fish*, and the dwarf and very useful and effective golden *Harry Hieover*, are the varieties mainly relied upon by Mr. Ward for bedding-out purposes. Dwarf blue, or, rather, mauve-coloured, *Ageratums Tom Thumb* and the *Zoo*, are also spoken well of, as also are the white varieties, *Snowflake* and *Enfant de Paris*; and deep blue is well represented in several small square beds, having a cask-shaped Irish Yew in the centre of each, filled with *Lobelia pumila magnifica*, and *Salvia patens*, the prettiest of blues.

Flowers are not the only tenants of the terrace, for close by is an aviary, where the plumage of particolored birds vies with the brilliancy of the flowers. Peacocks have even been known to strut about among the flower-beds, viewing them, no doubt, the while with contemptuous indifference.

The fruit houses are mostly hip-roofed, and here Grapes in their successional compartments, Peaches and Melons, looked promising; Pines are grown in pits, and exhibitors in some places will have this year, as in former ones, to reckon

with Mr. Ward. Twelve months ago last autumn Mr. Ward, finding that the Vines in the principal range of vineries which had been bearing heavy crops of fruit for the previous ten years showed signs of exhaustion, cut a trench 2 or 3 feet wide the entire length of the borders, inside and out, at between 4 and 5 feet from the stems of the Vines, replacing the excavated soil by a mixture of sound loam, wood-ashes, lime-rubble, and soot, in the proportion of about four loads of loam, one load of wood-ashes, one of lime-rubble or properly slacked lime, and an ordinary garden barrowful of soot, the whole being well mixed before being used. The condition of the Vines this year goes to show the wisdom of having subjected the Vines to the above somewhat severe measure of root-pruning. There are some twenty varieties of the Grape-vine cultivated under glass at Longford, but Black Hamburgh, Muscat of Alexandria, Madresfield Court, Mrs. Pince's Black Muscat, Gros Guillaume, and Lady Downes, are mainly depended on. And the same may be said of Melons, Carter's Blenheim Orange (scarlet-flesh), and Sutton's Hero of Lockinge, and Webb's President, both white-fleshed varieties. The Peaches and Nectarines finding most favour at Longford indoors and out, and of which the crops are equally good, are—Peaches under glass: *Hale's Early*, *Goshawk*, *Prince of Wales*, *Sea Eagle*, *Princess of Wales*, *Exquisite*, and *Barrington*. Nectarines: *Lord Napier*, *Pine-apple*, *Elruge*, *Balgowan*, and *Spencer*. Outdoors, in addition to the above, *Alexander*, *Amsden*, *Dr. Hogg*, *Royal George*, *Stirling Castle*, *Bellegarde*, *Dymond*, *Chancellor*, *Early Grosse Mignonne*, *Violette Hative*, and *Salway*. Nectarines: *Dryden*, *Humboldt*, and *Pitmaston Orange*. In addition to the list of Peaches, there are several young trees, received from Florida a year or two ago, which Mr. Ward has not yet fruited. Tomatos were, at the time of our visit, slightly affected with mildew and other fungoid abominations, but Mr. Ward is not a man to put up with their presence any longer than he can help, and we learn that shortly afterwards all the affected leaves were taken off and burned, a good watering at the roots afforded, air was admitted freely night and day, and the use of the syringe upon the foliage withheld; within a week all the plants recovered their health, and have been bearing excellent crops of fruit ever since. This is very encouraging, for if such practice answers the purpose, we need not run the risk of burning the foliage with copper-solution or sulphur. It must, however, be remembered, that it is not one fungus only which attacks the Tomato under glass, but two or three; and what may suffice in one case may be useless in another.

Cut flowers and plants for decoration are of course in great demand, but a gardener like Mr. Ward makes light of such requisitions. A commencement is being made with Orchids, *Lady Radnor* being very fond—and having a good knowledge—of them, and the plants are evidently thriving. Tuberose were looking so specially good, that we ventured to ask Mr. Ward to tell us "how it is done," and in another number he will kindly respond to our request. *Eucharis amazonica* are grown in large quantities, the plants being large and full of vigour. Mr. Ward is of opinion that if clean healthy plants are given a stove temperature, and kept uniformly moist at the roots while flowering, and for a few weeks after they are gone out of flower, giving frequent waterings of liquid manure during the interval, and afterwards partially withholding water from the roots until the

flower-spikes appear—no complaints of the plants being affected with the "mite" will be heard of. With clean plants to start with it is the treatment which they are subjected to that is responsible for the presence of the mite. Plants growing in a low temperature and over-watered at the roots are certain to be attacked with the mite. This is a fact. *Pancratiums*, in variety, also succeed with the same treatment as that given to the *Eucharis*. *E. Mastersi*, *E. caudata*, and *E. Sanderi*, are also grown, the flowers of these varieties being smaller than those of *E. amazonica*, are found very useful for special purposes. *Callas* and *Bouvardia Humboldtii corymbiflora* are largely grown for the winter and spring decoration of conservatory, rooms, &c. Two new pits facing due south, and 64 feet long each, are devoted to the culture of Violets, the varieties grown being *Marie Louise*, *Neapolitan*, *De Parme*, *Patrie*, *Victoria Regina*, *The Czar*, and *Comte Brazza*.

Out-of-doors the wall trees were looking well, but here, as elsewhere, this season, Pears were, to adopt an Hibernian mode of speech, conspicuous by their absence. Mr. Ward thinks highly of a new Lettuce known as *Carter's Harbinger*.

There is one feature at Longford worthy of note, as an illustration of good understanding between employer and employed, which, when it exists, contributes so much to the comfort of both parties. A portion of the pleasure-ground is reserved for the use of some of the upper servants, who in that spot select the plants to be grown, according to their fancy. As to Mr. Ward, he is to be made happy in the construction of a new and commodious residence now being built. Long may he continue to direct the gardens at Longford with the same skill and attention to detail that he now does.

NEW OR NOTEWORTHY PLANTS.

RHODODENDRON RACEMOSUM.*

WE have had such a feast of *Rhododendron* lately, that there is some chance of our forgetting or overlooking the humbler pioneers that gladdened our eyes in spring. That piece of ingratitude would, however, be sure to be remedied next season, for in this new Chinese *Rhododendron* we have, indeed, a plant which every plant-lover will appreciate. It is of dwarf habit, being not more than 5 or 6 inches in height, with loose heads of bell-shaped or funnel-shaped corollas of a rose-pink. The plants exhibited by Messrs. Veitch at the Royal Horticultural Society at one of the spring shows had been growing in the open ground, in their Combe Wood Nurseries, all the winter, so that their hardiness may fairly be assumed, for even in the blazing midsummer we could not quite forget what a terribly long and destructive winter we had.

We extract from the *Bulletin of the Botanical Society of France* the original description of the plant by M. Franchet, because Mr. Watson, in *Garden and Forest*, May 11, 1892, throws some doubt on the correctness of the name, and gives his reasons for so doing. Another season we shall have a better opportunity of investigating the matter. In the meantime, those who want a charming little shrub for the rockery or as an edging, should consult Messrs. Veitch as to the possibility of procuring it.

* *Rhododendron racemosum*.—Frutex humilis, ramulis horntinis glandulis scabris. Folia coriacea obovata vel elliptica supra pallide virentia glaberrima subtus glaucescentia lepidota. Gemme unifloræ vel nunc 2-3 floræ, omnes axillares nunc fere e ramorum ortæ. Flores parvi rubescetes longe pedunculati; calyx e minimis, lobis fere inconspicuis; corolla tubuloso-campanulata $\frac{1}{2}$ — $\frac{2}{3}$ pollicaris; stamina 10 exserta, filamentis inferne pubescentibus; ovarium dense lepidotum. [Yun nan in monte He-chan supra Lan-Kong, alt., 3000 m. (Delavay, n. 838), et in Monte Tsang Chang (n. 299). Franchet in *Bulletin de la Société Botanique de France*, 1887, vol. 34, p. 253.]

FORESTRY.

LARCH DISEASE.

MUCH has been said and written upon this subject, but the mass of evidence brought to bear upon it is of so conflicting a nature, that in place of throwing a ray of light, it rather tends to envelop the subject in a bewildering cloud of gloom and mystery. This arises, in a great measure, from the fact that the Larch is subject to a plurality of diseases, and these are often simply spoke of as the Larch disease, without giving the distinguishing details as to the origin and mode of attack, hence the conflicting opinions and theories advanced regarding it. As my practice and observation have extended over a wide range of country in Great Britain and Ireland for a period of some fifty years, and under very different conditions as regards soil and climate, it may, therefore, not be thought altogether presumptuous if I offer a few remarks on this vexed question.

In the first place, then, plants and trees, as a

the vitality of home-saved as compared with foreign seed. One pound of foreign seed will often produce as great a number of plants as 5 lb. of home-saved seed; and besides, foreign seed generally vegetates several days earlier than home seed under the same cultural treatment, and this blunted vitality from inferior seed appears to me to be the first stage of the Larch disease proper. Trees raised from home-saved seed do not start to grow so early in spring as such as are raised from foreign seed, consequently they are less liable to be damaged by late spring frosts, and this explains the reason that many planters prefer the former. This, however, applies to young trees in the early stages of their growth; after the trees are established in the forest, the difference as regards hardiness is less perceptible.

Many years ago, when laying off and forming the principal plantations on the Balmoral estate for the late Prince Consort, I planted the top of a Heather hill exposed to the full sweep of the wind from all quarters, with a mixture of Tyrolese Larch and Scotch Fir; and as there was no regular forester at that time, nor for many years afterwards, upon the

Larch tree affected with ulceration in Ireland, where the climate is more genial and the frosts of shorter duration. For full particulars about this disease, see my prize essay, written upwards of twenty years ago, and to be found in the *Transactions of the Highland and Agricultural Society of Scotland*. Sometimes the surface of the ulcerated spot gets partly covered with a fungoid growth, which appears in groups like small warts of a reddish and sometimes of a yellowish colour (*Nectria cinnabarina*), but these may be effectually killed by painting the spot with coal-tar, and although the growth of the trees is retarded, yet they are seldom killed by this disease. This fungus often attacks hard-wood trees in a similar manner at places where the bark has been damaged.

Larch attains its best form of development on loose soil well mixed with a small portion of clay and organic matter to attract and retain moisture; wet ground attracts frost, and promotes ulceration; dry inorganic shingle, hard gravel, loose sand, stiff clay, and moor-pan produce heart-rot and pumping. Soil that contains upwards of 20 per cent. of lime is inimical for Larch culture, the trees appear to thrive in such a soil for a few years, but ultimately they exhibit a stunted growth, and often die off in a wholesale manner, without any apparent cause whatever. The climate of Ireland is more suitable for the growth of the Larch than that of Great Britain, frosts are less intense and of shorter duration, the heated vapours arising from the Atlantic waves soon dispel the snow clouds in the air which fall in genial showers of rain to promote vegetation, and thus imprint upon the bosom of the earth in God's language of Nature the "green isle." *J. B. Webster, Planter and Wood Surveyor, Fairview, Stangmore, Dungannon.*

FIG. 9.—RHODODENDRON RACEMOSUM: HARDY DWARF SHRUB; FLOWERS, PALE LILAC.

general rule, prefer some particular class of soil and situation to promote their best form of development. The natural habitat of the Larch is on the Swiss and Tyrolese mountains, the geological formation of which, we are told, consists of different kinds of rocks, such as mica-slate, granite, limestone, sandstone, &c.; and although the Larch grows and reproduces itself on the former class of rocks quite freely, yet we are told by pedestrians who have traversed these mountains, that the tree is not to be found on the limestone and sandstone formation at all—or, at any rate, when it does appear, it only attains the size of stunted scrub. Now, as a planter, I can count my acres by thousands, and my trees by millions, which I have planted on all classes of soil from the sea-shore up to the highest point of arborecent vegetation in this country, and as a general rule I have found the Larch unsuitable for planting on the sandstone and limestone rocks, as they seldom attain a profitable size, and in many cases die off altogether without any apparent cause whatever. Such trees, however, generally produce abundance of cones, and as they are easily collected from small trees as compared with cones upon tall healthy trees, the seed collector prefers them; and this accounts in a great measure for the difference in

estate, I pointed out this part of the forest to the present forester, Mr. Michie, while there on a visit some time ago, and he tells me that he cannot distinguish any difference between them and the common Larch in the same forest. These forests and plantations are extensive, and took me upwards of six years to accomplish their formation.

ULCERATION.

This disease is often spoken of and confounded with the Larch disease proper, which originates, as I have already shown, by planting the trees on ground inimical to their best form of healthy development; while ulceration is produced by cold and exposure, such as late spring and early autumn frosts, which occur before the wood has become firm and matured. When the trees are frost-bitten in spring, the natural flow of the sap is suddenly arrested, small blisters are then apt to appear here and there along the stem, and sometimes ulceration sets in, which is Nature's mode of discharging the contaminated sap caused by the sudden change of temperature and want of leaf-action. This disease is quite common in many parts of Scotland and England, where the frosts are often severe and of long standing; but it is a curious fact that I have never seen a single

WIRED-WALLS FOR FRUIT TREES.

I HAVE lately met with some striking cases of failure in regard to these. Old walls are often uneven and irregular, and as a short cut to remedy these evils a straight wire or iron rod is carried across the most projecting points. On these, galvanised or other wire is stretched to form a trellis, and on the latter the trees are trained in straight and methodical forms. The trees are not only to hide out of sight the crumbling inequalities on the face of the wall, but to furnish the area with a profusion of brilliant blossom and a plentiful supply of luscious fruit. But somehow, unless the very hardiest varieties of Apples or other fruits are planted, neither one nor the other covers in the manner and to the extent so confidently expected.

Within a few weeks I was consulted as to the failure of such a wall furnished with Peach and Pear trees. The aspect was south with a point or two of west. It could hardly have been more favourable in the thoroughly sheltered position in which it occurred. The soil had been bodily removed to the depth of a yard, and replaced with such a holding loam as these trees delight in. The trees had also made a good growth, and had been in these favoured quarters, and the owner had never gathered a fruit off either of the trees on this his best wall, which had cost him so much for trees, trellising, soil, and labour.

"Now, Sir, can you unravel this mystery?" My answer was "No—for the all-sufficient reason that there is no mystery about it." The sun shone with summer-like heat on this day of early spring. Nevertheless, the east wind iced the genial temperature down very considerably. "What is the secret then?" impatiently asked my interrogator. My answer was "Cold." He replied composedly: "Place your hand—or better still, your head—in the unusually large vacuum between the trees and wall, and prove the truth." I did so, and was speedily satisfied that with any living thing disliking perpetual draught, this was the surest possible way not only to strip its leaves of blossom or young fruit, but to undermine its health or destroy its life. My receipt for making these trees fertile, was either to build up the wall with rough bricks, stone and

mortar to the level of the trellis, or take the trellis away, and allow the branches to follow the irregular lines of the wall. By some such methods, the perpetual draught or cold-producing current, chilling the trees, would be stopped, and they would proceed to bear forthwith. They were simply starved into sterility to shut out the cold, and the available heat would immediately be utilised in the conversion of the vital and growing force of those trees into luscious produce.

During the same week, the following case was laid before me. Some tall forest trees were taken down at the eastern side of an exposed orchard. It was desired to utilise the space, and shut out the wind by erecting a wooden fence 9 feet high. It was proposed that the deals or slabs forming this fence should meet edge to edge without any feather or strip of wood between; the slightest shrinkage would have converted this fence into a veritable air sieve. And yet a choice collection of Pears and Plums was to be grown on this wooden fence; though owing to the slow conducting powers of wood it is always inferior to bricks as a background for rearing and training choice fruit trees. Trained against the wood, the trees will seldom be so warm as those in contact with a brick surface. On the other hand, it must be admitted they may never be quite so cold.

But the following query arrived by post just when the trees were ready to plant: "How far should we place our trellis for the trees from the boards—six, or nine inches, or a foot?" My prompt answer was: "No trellis, unless you forestall your trees into shrubs through a perpetual current of cold established and continued through all time in the vacuum thus created between the trellis and the hoarding. Plant your trees, and train them against the boards, and keep out all draughts under or between any part of the fence, and there is good ground for hoping for perfect crops of fruit." If our heating or training surface is not always so good or warm as we may wish, that is a good reason why we should put our trees close up to it, so as to enable it to absorb all its available caloric instead of chilling it down with the intervention of a trellis or a vacuum to please the eye, or for any other purpose. The primary object of growing fruit trees is for their fruit, rather than to render rough walls smooth on their surface, or crooked walls straight. *D. T. F.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA WARSCEWICZII (GIGAS).

SINGLE flowers of three fine varieties come from as many senders. That from Joseph Broome, Esq., of Llandudno, is a noble flower of the *Sanderiana* type, the expanded petals reaching 9 inches, and being 3 inches broad. The labellum is 3 inches across, of a rich velvety-crimson, the edge lilac, mottled with crimson, and the whole flower fine in form and rich in colour. That from G. C. Raphael, Esq., Castle Hill, Eaglefield Green, was bought for *C. aurea*, and it bears traces of that variety in it. Its sepals and petals are delicate pink, the lip fine crimson, with yellow and purple markings in the throat. The third comes from John Mills, Esq., Bitterne Park, Ringwood (gr., Mr. J. Smythe). It is smaller than the other two, but has a rich colour, the light patches on each side of the labellum being smaller than usual, and white, with a shade of yellow. All are beautiful, and serve to show the variability of this favourite species.

FOREIGN CORRESPONDENCE.

POISONS ON AMERICAN FRUITS.

THERE has recently appeared in a number of European horticultural and other papers, articles condemning American fruits, on the ground that they contain poisons left there in the process of spraying for fungous and insect pests. So far as we are aware, the charges set forth in these articles are based wholly on assumptions, no direct evidence whatever of the presence of poisons on American

exported fruits having been produced. One of the principal arguments used by the writers of the articles referred to, is that certain boards of health in the United States have seen fit to seize and destroy large quantities of sprayed fruit because they contained poisons in sufficient quantity to menace the public health. Much capital has been made of this, yet when the question is fully understood, it will be seen that as an argument against all sprayed fruit, it carries little weight. The New York City Board of Health is, so far as we know, the only one that has taken any definite action in this matter.

The causes which led up to this are fully explained in the following report, which was made by the writer to the Secretary of Agriculture, and published by his authority in the Annual Report of the Department for 1891:—

"In the latter part of September much excitement was created in New York city by the Board of Health seizing a quantity of Grapes which had been sprayed with Bordeaux Mixture. All sorts of rumours were rife at the time, columns of sensational matter appearing every day in the leading papers of the city and state. This, of course, seriously injured the Grape market, which, for various other reasons, was already considerably depressed. At the request of the New York Board of Trade, and in accordance with your instructions, I went to New York city when the excitement was at its height. It was found that the sensational reports, to the effect that tons and tons of Grapes were being seized and dumped in the river, were wholly without foundation. The Board of Health, acting upon the advice of its assistant chemist, had seized a small consignment of fruit from Ulster county, New York, and upon this most of the fabulous stories were based. Soon after my arrival a meeting of the Board of Trade was called for the purpose of allaying, if possible, the fears of the public, and restoring the market to its usual condition. By request, I addressed this meeting, and gave a detailed account of the methods employed in treating Grape diseases, dwelling particularly on the Bordeaux Mixture, and its entire harmlessness when properly used. The meeting appointed a committee to confer with the Board of Health on the subject. I was invited to be present at this conference, which took place immediately after the adjournment of the Board of Trade meeting. The committee was received very cordially by the Board of Health, and, after some preliminary remarks by the president, I was again asked to give an account of the Bordeaux Mixture, how it was made and used, what it was used for, &c. This being done, the Board of Health gave its side of the case, which, in brief, was that their attention had first been called to the matter by citizens sending in a quantity of Grapes, plastered with a bluish-green substance. The matter was referred to the assistant chemist, who decided that the bluish-green deposit contained copper in large quantities. Search was then made at the fruit stands, commission houses, boat landings, and other places, the result being in accordance with the facts already set forth. After further deliberation, the following statement was prepared by the Board of Health, and given to the papers:—

"1. A copper salt is found only upon a very small part of the Grapes offered for sale, and the Grapes which are to be avoided are easily recognised by the greenish-coloured substance upon the berries and stems.

"2. Whenever this substance is apparent upon the berries or stems, the Grapes should be washed before they are used as food or in the manufacture of wine.

"3. The Board urges all dealers and consignees in this city to advise shippers and consignors of Grapes to send no more Grapes to this market upon which the substance is apparent. The Board further states that it does not object to the use, at the proper time, of the Bordeaux Mixture as recommended by proper authorities, but such Mixture, or any mixture containing poisonous substances, should not be sprayed or otherwise placed upon the Grapes immediately before or after they have matured, and

should not appear upon them when sent to the market or offered for sale.

"For the purpose of inspecting the vineyards the Board of Health, before finally adjourning, decided to send the assistant chemist to the region from which the seized fruit came. The Department of Agriculture was also represented at this inspection, Mr. D. G. Fairchild being selected for the purpose. No facts of importance were brought out by the visit of the assistant chemist and Mr. Fairchild, excepting that wherever Vines have been sprayed in accordance with the precautions so many times set forth by the Department, the fruit was in excellent condition, both as regards freedom from rot and objectionable deposit. After this nothing further was heard of the matter, and in a week at most the market had assumed its usual condition. Looking at the matter from all sides, no conclusion can be reached other than that the blame for the scare and its consequences rests about equally between the Board of Health and a few over-zealous Grape growers. There is no doubt that some growers exercised gross carelessness in unnecessarily daubing their fruit with the Mixture long after the treatment should have ceased. Even when it came to send the Grapes to market, they were in some cases seemingly dumped into the baskets without the slightest effort being made to remove the bluish deposit, which was in no case found on berries properly treated. Only a few growers did this, but thousands were made to suffer thereby. On the other hand, the Board of Health acted hastily in the matter, and by its method of conducting affairs, caused the Press to make a mountain out of a mole-hill. Altogether, the lesson has been a valuable one, and it again forcibly illustrates the old saying that even the best remedies in the hands of some will often prove a curse. In some parts of the country, Grape growers were actually spraying their Vines two or three times a week, thinking, as some of them have stated to me, if twice a month was good, four or five times as often would be a great deal better.

"In this connection it may be well to caution all Grape growers in regard to use of Bordeaux Mixture in seasons of drought. In case dry weather sets in after the first or second spraying, it would be well to make the rest of the treatment with the ammoniacal solution of copper carbonate. Altogether, this course of treatment will probably be just as effective against rot and other diseases, no matter what the season may be. It is certainly cheaper, and removes at once all possibility of disfiguring the fruit. It should be borne in mind, however, that the application of all fungicides should cease as soon as the fruit begins to ripen. If this be done, not the least damage to health need be apprehended from eating the fruit or drinking the wine made from the same."

Since the foregoing was written, nothing has transpired to change the views therein set forth. Grape growers all over the United States are spraying their fruit, and it is safe to say that where this work is intelligently done, the crops will not only be saved from black rot and mildew, but will, as we have elsewhere * shown, be as harmless as our everyday foods and drinks. *B. T. Galloway, Department of Agriculture, Washington.*

BUITENZORG, JAVA.

Dr. Trimen thus reports on the famous botanical establishment under the direction of Dr. Treub:—

"The Dutch botanical establishment at Buitenzorg is of a different character from this [Ceylon] or any English one, not even excepting Kew, and is maintained entirely on a scientific basis. The director has the control of all the six departments into which the institution is divided, as follows:—1, the herbarium, library, and museum; 2, the botanical laboratory; 3, the experimental garden and laboratory for agricultural chemistry; 4, the pharmacological laboratory; 5, the botanic gardens; 6, the

* Farmer's Bulletin No. 7, U. S. Department of Agriculture, Washington, D. C., 1892. "Spraying for Insect Pests and Fungous Diseases, with a Special Consideration of the Subject in its relation to the Public Health."

photographic institution. Each of these departments is under the immediate management of a highly-trained scientific or technical chief from Holland, and most of these have also an assistant. There is thus a large staff of Europeans. The laboratories, library, &c., are completely stocked, and kept fully up to the time, and everything is provided for close investigation and original research in all branches of botanical study. Many students are thus attracted from Europe, and the laboratories afford accommodation for a considerable number of workers. A valuable serial publication, the *Annales du Jardin de Buitenzorg*, is issued at intervals, devoted to scientific botany, and another one, *Tijdsmanlia*, occupied with economic and garden subjects.

"The Botanic Gardens themselves at Buitenzorg occupy between 60 and 70 acres, at an elevation of about 800 feet, with a fine soil and abundant water, and are well protected by a high iron railing and a barbed wire fence. Nearly the whole is occupied by a classified arboretum, each natural order being isolated by a road or path. The collection is extremely rich, and every species is elaborately labelled with upright labels made of the very hard wood of *Eusideroxyton*, which is never attacked by termites. The whole is now much too crowded, and cannot be said to be of much beauty, but is, of course, extremely convenient for scientific study. Connected with Buitenzorg is a small hill-garden, at Tjibodas, 4700 feet, also under a European superintendent, where is also a house for the Director, and a laboratory and accommodation for four students.

"The experimental garden (*Cultuur-tuin*) is about 2 miles from the main garden, and is 200 acres in extent, but is not all at present occupied. It is laid out in square plots, each devoted to one product; large labels at each corner give the name, date of sowing or planting, and other information. Here are very many plants of great interest. Though a large distribution of seeds and plants is made to planters and others, no charge is made for anything.

"On the whole, I was filled with surprise and admiration at the completeness of Buitenzorg as a centre for botanical work; the only weak side seemed to be the herbarium, which is by no means kept up on a par with the rest of the means of study."

FRUIT NOTES.

LAXTON'S SCARLET QUEEN STRAWBERRY.—For comparison sake, I planted the above variety alongside of *Vicomtesse Héricart du Thury* and *Laxton's Noble* on a south border. When the plants were commencing to grow, frame lights were placed over them. Fruits of *Noble* were gathered on June 4, *Scarlet Queen* three days later, followed by *Vicomtesse* a few days later still. The Strawberry that is likely to displace *Noble* for earliness is *John Ruskin*. *T. H. Slade*.

HARDY APPLES.—We have often compared Apples as to their hardness, quality, and general value, and while trees are now unloading themselves, we see that *King of Pippins* and *Golden Spire* retain their good character by holding their crop tenaciously; while our favourites, *Stirling Castle* and *Seaton House*, known as two of the most productive kinds extant, and of very hardy constitution, are relieving over-taxed Nature every day. To some extent it shows how much cultivators in the north should make selections instead of collections of fruits when plantations of fruit trees are under consideration. It is not only altitude but latitude and longitude which have to be considered, and the nature of the soil and state of drainage as well, when the planting of fruit trees is to result in a tangible success. *M. Temple*.

KNIPHOFIA PAUCIFLORA.

The accompanying sketch was made from a plant which flowered in the Royal Gardens, Kew, in March last, and now at the present time the plant is again in full flower. It was first described by Mr. Baker in

the *Journal of Botany*, xxiii., 1885, p. 280, and was introduced to cultivation a couple of years ago. Though by no means so striking as the old *K. aloides* (*Tritoma nvaria*) and its numerous varieties, *Kniphofia pauciflora* is a no less remarkable plant; and, as may be seen from the drawing, not without a claim to beauty, especially as the flowers are bright yellow, with all the stamens more or less exerted. The whole plant grows from 1½ to 2 feet in height, the leaves few, firm in texture, about 1½ feet long, and half an inch broad, with many distinct ribs, and a thickened smooth margin. The raceme varies from 2 to 8 inches long, in strong specimens to a

FIG. 10.—KNIPHOFIA PAUCIFLORA: FLOWERS YELLOW.

foot or more, flowers all bright yellow, the perianth somewhat cylindrical, about an inch long or more, the segments ovate, as long as broad, style and stamens exerted, ovary round. The bracts are narrow and acute, about ½ inch long. Should this curious species retain the character of flowering twice or oftener in the course of the year, it will, indeed, be a great acquisition as a cool greenhouse subject. The whole plant is graceful in habit, the flowers are bright and attractive, and they first appear in March—a time when plants of this class are a desideratum. Its hardness, so far as we know, has not been tested. It will probably require a sheltered spot, and even this we should not advise unless we can get duplicates. It is a native of Natal. *D.*

M. JADIN'S VISIT TO THE MASCARENE ISLANDS.

(Continued from vol. xi., p. 718.)

"THE manufacture of perfumes, although only started for a short time, is already considerable. Principally, it is confined to the essences of *Geranium*, *Patchouly*, and *Vétiver*.

"The essential oil of *Geranium* is incontestably that of which most is manufactured. It is extracted from the leaves of *Pelargonium odoratissimum*, a plant which grows and thrives very well at all altitudes in this climate. [It is doubtful whether M. Jadin forgets that the *Piton des Neiges* in Réunion exceeds 10,000 feet altitude, where only alpine plants are to be found?] The altitudes comprised between 400 and 600 mètres, i.e., between 1,400 and 2,000 feet are most favourable for its production; and here three crops are gathered within fourteen months. The yield from March to October exclusively is the most abundant, a period of lesser growth is that from October 15 to January 15.

"Calculating at 40,000 feet to the hectare, each cutting gives about 14,700 kilogrammes for each crop. This weight of the yield (with the leaf a certain quantity of woody stalk is gathered which, while augmenting the weight, diminishes the yield), gives from 10 to 12 litres of essence. A kilogramme of essence is worth, generally, about 60 francs, which gives an annual return of 1,750 francs (£70) per hectare.

The essence of *Patchouly*, which is extracted from the leaves of one of the *Labiata*, *Pogostemon Patchouly*, gives a still better yield with more advantageous results; 50 kilogrammes of its leaves give 875 grammes of essence, or thereabouts. This plant also thrives very well in these climates.

"Lastly, the essence of *Vetiver* is extracted from the roots of a grass—*Andropogon muricatus*. The plant is very common in the Mascarenes; it often borders the fields of sugar-cane, and does not require the least care for its cultivation. Of this essence 400 or 500 grammes are furnished by 50 kilogrammes of roots; but the difficulty of extraction has not hitherto enabled the planters of Réunion to export this production with the requisite purity for the market.

"Of these three essences, that of the *Geranium* is most in favour in our colony. [It is needless to remark that black people are extravagantly fond of using strong perfumes, for very obvious reasons.]

"During the last few years, several large plantations of quinine have been formed at Réunion. Dr. Auguste Vinson,* the author of a valuable work on the spiders, *Arachnida*, of Réunion), succeeded in obtaining some *Cinchona* plants from seeds received from Monsieur Decaisne, through the kind services of General Morin. In 1888, some 31,700 feet planted by the Colonial Forests' Department had proved successful, and from this source the Department has distributed to a number of proprietors 4,150 plants. The nurseries of the Government (*service domaniaux*) contain some 16,500 plants of *Cinchona*. These plantations succeed well between 500 and 1,000 mètres (1,700 and 3,500 feet) altitude. 'The sloping sides of small ravines or depressions facing the leeward side of the mountains are most propitious for the cultivation of the *Cinchonas*. We were enabled to inspect these plantations under favourable circumstances, and the Director of the Forests Department, Monsieur Neveu, hoped soon to be enabled to gather a certain quantity of bark. Already in 1880 the Director of Woods and Forests had been able to sell a small quantity.'

"In countries like the Mascarenes, where fever is so common and endemic, where the health deteriorates so rapidly in constantly fighting against the attacks of malarial poison, it is readily conceivable how useful these plantations of quinine will become.

"We must not conclude these few pages, treating of the agriculture of the islands, without mentioning the very praiseworthy efforts made, particularly at

* Dr. Auguste Vinson was in the Mission to Radama II., in Imerina, in 1862, where the translator had the pleasure of making his acquaintance. *S. P. O.*

Mauritius, to introduce the cultivation of tea. Whilst at Réunion coffee is consumed in great quantities, Mauritius, under the soft influence of the English ladies, without abandoning the traditional 'cup of Creole coffee,' whose renown is so justly merited, consumes a great quantity of tea. The Chinese population is somewhat numerous, and assists a good deal in this consumption. In 1888 the importation of tea was 53,881 kilogrammes, amounting to a value of 186,652 francs (£7,466). These figures induce a certain attention to be given to the cultivation of tea, especially when it is known that localities unsuitable for the sugar-cane are well fitted for tea plantations.

"At Réunion, in the Brulé de Saint Denis,* at about 1000 feet altitude, we have seen tea plants growing well, uncultivated, and without any care being given to them. At Mauritius, on the high ground of Chamarel, we have been able to witness the same circumstance; indeed, many of the high plains of Réunion are uncultivated, and we understand that sugar cultivation has been abandoned at Chamarel. Could not such localities be utilised for the cultivation of tea? It is useful to note that the tea cultivation is highly beneficial, and ought to pay well. The example of Ceylon, before quoted, ought to act as a stimulant for the colonists of the Mascarenes.

"Some praiseworthy efforts, we repeat, have already been attempted at Mauritius; in fact, beside a Government plantation, already supplying a well-perfumed and agreeably-tasted tea, we have seen a private plantation started. It is of considerable importance, and we are convinced that it will give good results.

"We have already noticed that the orography of the two islands is different; we ought not, therefore, to be astonished to find their floras somewhat unlike one another.

"The high altitude attained by the mountains of Réunion determines a variety in its vegetation, which loses its tropical character, and assumes a special physiognomy. Here we see small stunted shrubs, with low and twisted trunks, nowhere surpassing the height of a man. Here are mostly the Ericaceæ of the genus *Philippia*, vulgarly called *Ambavilles* (Heaths), causing the creoles to give to these highlands the name of the region of the *Ambavilles*; and amidst these Heaths are some *Acacias* here and there (*Acacia heterophylla*).

"This region of Heaths is found at about 5,000 feet elevation; but even below, from 3,000 feet upwards, these Heaths begin to show themselves, and predominate more and more over the other forest species as you ascend. This region is succeeded below by a zone of Bamboos, *Nastus borbonicus*, which has been well observed and described by Bory de Saint Vincent. Below the Bamboo zone, the vegetation of the island of Réunion, like that of the sister island, Mauritius, has a physiognomy eminently tropical; in these lower regions the same character is observable in the two islands. 'Since the publication of Mr. Baker's well-known work on the Mauritius flora,† in certain most important books, like that of Grisebach,‡ for instance, different estimates are given of the dissimilarity between the floras of Mauritius and Réunion; we cannot help thinking that it is, as yet, difficult to pronounce authoritatively on this assumed want of resemblance, and we sincerely hope that a flora of Réunion, as complete as that of Mauritius by Mr. Baker, may be undertaken and published, in order that these ideas on the resemblances and dissimilarities of the floras of the two Mascarene islands may be definitely fixed. The large collections stored for a long time at the Museum of Paris could surely furnish all the necessary material and elements for the work. [An

immense number of plants, collected by Commerson, yet remains all but untouched.]

"The point of departure of these modern ideas is the following passage in the work of Mr. Baker:—'In its orography and botany, Mauritius offers a striking contrast with Bourbon and Madagascar, where the highest mountain-tops are in the centre of the island, attaining a height of 10,000 or 12,000 feet, covered with snow during several months (p. 14).' This is going rather far in its conclusions, as least as regards Réunion. In this island, it is true, the Piton des Neiges rises to 10,000 feet, but it is seldom covered with snow (in 1890, the year of our visit to the Mascarenes, it was not so covered); as to the mountains of Madagascar, which are not higher than the Piton des Neiges, we doubt if they are often covered with snow. [Snow is unknown as remaining on the highest mountains of Madagascar. The highest peaks are those of the Ankaratra mountains, only about 8,000 feet, far below the limit of perpetual snow-line. A few flakes of snow, and a rare shower or two of hail, have been recorded on the highest regions of Madagascar, with hoar-frost, but nothing more.]

"On the other hand, all the plants introduced into Mauritius, and which are there naturalised, are also naturalised in Réunion. The fruit trees are the same in the two islands; we give the following as the most important:—The *Anona*, *A. squamosa*, L., which furnishes the *Atte*, or *Custard Apple*; *A. muricata*, L., or *Corossol*, the *Sour-sop*; *A. reticulata*, which produces the *Cœur-de-bœuf* or *Sugar Apple*. The *Citrus*, amongst which we may specify the large fruits of the *Citrus decumana*, the *Shaddock* or *Pamplemousse*; the *Mangifera indica*, L., or *Mango*, in very numerous varieties.* The *Spondia dulcis*, Forster, which yields the *Ilévis* or *Fruit of Cythera*, the *Otaheite Apple*, introduced from the South Pacific by Commerson (after Bougainville's return voyage); several *Myrtaceæ*, amongst which the *Eugenia Jambos*, L., or *Jambose* and *Psidium Guayava*, or *Guava*, are very common; the first growing on the sides of the smallest streams, and the second in uncultivated fields. The *Persea gratissima* or *Avocado Pear*; the *Papayes* of the *Carica Papaya*, so common that pigs are fed on them. The fruit of the *Nephelium*, *N. Lit-Chi*, of *Cambessèdes*, and *Nephelium Longana* of *Cambessèdes*, the *Letchi* or *Lychee* from China. Several *Artocarpus*, particularly *A. integrifolia*, L., or *Jack-tree*, which furnishes from its enormous fruits a seed recalling to mind the Chestnut in taste; the *Musa* or *Banana*, &c.

"Besides the fruit trees, the vegetation of the uncultivated fields is the same in the two islands; there are the *Leucœna glauca*, *Beoth*, or *Acacia*; the *Tetranthera laurifolia*, Jacq., or *Bois d'oiseaux*, *Birdwood*; the *Lantana camara*, L., or *Vieilles-filles* of Mauritius, and the *Corbeilles-d'or*, of Réunion; this plant, introduced but lately, has spread with an extraordinary rapidity. The shores are shaded by the same tree, *Casuarina equisetifolia*, Forst., or *Filao*; and where the coast-line is sandy, there grows the *Ipomœa pes-capræ*, Roth., (*Batatrant*, or *Batate à Durand*, of the *Créoles*), which covers the sand with its creeping stalks, with leaves of a bright green, mingled with blossoms of a violet-rose tint.

"In short, we know that agriculture utilises the same plants in the two islands, and if Réunion occupies herself more especially with some products which Mauritius does not manufacture, it is solely because certain lands in the French colony do not offer the same facilities for cane culture by reason of the difficulty of communication along the coast, the consequence of the orography.

"All that remains of the primitive forest, nearly destroyed now, especially in Mauritius, has the same

character: mossy trunks covered with *Orchids*, numerous *Ferns*, climbing plants running from tree to tree, the *Rubiaceæ*, *Myrtaceæ*, *Sapindaceæ*, several *Terebinthaceæ*, *Palms*, *Pandani*, &c., form the principal characteristic forest habitants.

"Reverting now to the flora of Mr. Baker, this author describes 1,058 plants, indigenous to Mauritius, Rodriguez and the Seychelles, of which 869 are spontaneous at Mauritius. A little more than a third, about 267 species, are quoted by him as likewise existing at Réunion. [With regard to these numbers of species common to the two islands, Mr. J. G. Baker writes:—'This figure of 287 is quite delusive. It does not include the cosmopolitan weeds, most of which grow in Mauritius, and occur also in Bourbon.' And again he explains that the above figure conveys an utterly wrong idea:—'In the *Flora of Mauritius*, the extra-Mauritian distribution of every species not endemic is given. He [Jadin] has counted only the species where Bourbon is expressly mentioned, not the plants of wide distribution, such as the cosmopolitan weeds, like *Solanum nigrum* and *Bidens pilosa*. Of course the widely-spread weeds that are found in Mauritius are nearly all found also in Bourbon. The species common to the two islands must be nearer 600 than 287.']

"Nevertheless, Mr. Baker has not attempted to search all the available documents on the flora of Réunion—this was not within the scope of his work—we notice, for instance, quoting at hazard from recollection, several *Solanum* (*S. nigrum*, L., *S. auriculatum*, Ait.), the *Ipomœa pes-capræ*, Roth., the *Siegesbeckia orientalis*, L., and the *Bidens pilosa*, L., &c., which he does not indicate as existing at Réunion, and which are nevertheless very common in this island.

"The families, best studied in the two islands, as the *Orchids* and the *Ferns*, are those which present the largest number of types common to both islands, according to Baker's *Flora of Mauritius*; thus, out of seventy-four species of *Orchidaceæ*, considered as spontaneous at Mauritius, forty-three are quoted by the author as existing also at Réunion; among 144 species of *Ferns* indigenous to Mauritius, sixty are also found in Réunion.

"We fancy that a flora of the island of Réunion would augment in notable proportions the number of species common to the two islands, without altogether showing a perfect similitude in the vegetation of the Mascarenes. Besides this, at Mauritius itself, it can be pointed out that certain species are confined to the small islets situated to the north of the island without having representatives in Mauritius; such are the *Latania Loddigesii*, Mart., or *Latania* of Round Island; the *Hyophorbe amaricaulis*, Mart., or *Palmiste gargoulette* (*Water-bottle Palmiste*, from its bulbous trunk), the *Pandanus Vandermeerschii*, Balfour fil., or *Sea Vacoa*—*Vacoa de mer*, which are confined to the so-called *Gunner's Coin Island*, and to *Round and Flat Islands*, three small rocky islets separated from Mauritius by insignificant arms of the sea.

"Another reason seems to confirm this idea, and that is the similarity of the fauna of the two islands: no large carnivore, no venomous reptile [on *Serpent Island* there are poisonous snakes]; on the contrary, large birds of different varieties which have now disappeared, as the *dodo* (*Didus ineptus*), the *Aphanapteryx* (*A. Broeckii*), the *Mauritius parrot* (*Psittacus mauritianus*), &c. . . . All this seems to give us reason to believe that Mauritius and Réunion formed one whole country, divided by some ancient dislocation, causing minor variations in the flora and fauna of the two islands, which preserve, however, in their broad lines, the same essential character.

"It seems to us, then, that if Mauritius and Réunion have nearly the same flora; the botany of these two islands differs considerably more from that of Madagascar than that of Mauritius differs from that of Réunion.

"These reserves being made, it remains to us to note, after the important work of Mr. Baker, that, out of 869 species spontaneous to the island of Mauritius, the dicotyledons include 460 species, the

* Places where the lava flows have streamed down from extinct craters are called *brulés* in Réunion. *Le pays brulé*, or *Le grand brulé*, is the district still devastated by the recent lava flows from the active volcano. *S. P. O.*

† *Flora of Mauritius and the Seychelles*. J. G. Baker.

‡ *La Végétation du Globe*. Par Grisebach; translation by P. Tchibatchef.

* The Mangos, which are most appreciated in Mauritius, include the following named species, viz., *Mangue Alphonse*, M. Aristide, M. Auguste, M. Bombay, M. Bourbon, M. Charpentier, M. Collard, M. Colville, M. Dauphiné, M. Figet, M. gelée, M. Genève, M. Goa or M. Madame, M. Lartique, M. Legal, M. Maison Rouge, M. Papaye, M. rosa, M. Sabre, M. Torse. Of these, *Mangue Auguste* and *Mangue Genève* are by far the most tempting; a most luscious and delicious fruit, with absence of the turpentine flavour which often disgusts European visitors who take the first Mango they come across.

monocotyledons 245, and the vascular cryptogams 164 species.

"The families represented by the largest number of species are in decreasing order, the Ferns, the Orchids, the Grasses, the Cyperaceæ, the Euphorbias, the Composites, the Rubiaceæ, the Leguminosæ, the Myrtaceæ, and the Pandani; this is very nearly the dominant order usual throughout all tropical countries. If instead of enumerating the number of species, we consider those species most common, and classify them in order of their frequency, it would give a far better idea of the physiognomy of the country, and then we should be far more struck with the resemblances than by the differences between the two islands, which, in spite of human treaties made on paper, will ever remain the sister islands." *S. Pasfield Oliver, Moray House, Anglesey, Gopport.*

FLORISTS' FLOWERS.

THE AURICULA.

The repotting of the show Auricula was recommended as soon as they passed out of bloom, and pretty full instructions about the work were given by me at p. 589 of the last volume of the *Gardeners' Chronicle*; some, indeed most, of the leading cultivators, recommend repotting in May, but it is not always convenient to repot the plants just at the proper time, and they have to stand over to a more convenient season. I was repotting my plants in the first and second weeks of July, and they are in very good condition, and they are not nearly so much infested with the woolly aphid as in previous years. The immunity from this troublesome parasite I am inclined to attribute to persistent brushing the necks of the plants with a camel-hair brush, bestrewn with tobacco-powder, and I do not know any better way to apply the powder than this. As repotting goes on, numerous offsets have to be removed from the plants, and these are cleaned from the said aphid and planted each one carefully in small pots, and in finer, sandier soil than the larger specimens. They are then placed under hand-lights, and closely shut in till the rootlets have seized on the soil. The offsets put in last year at this time have not yet grown into full-sized plants, still, they have been repotted, and I hope to get some of them to flower well next season. These are also kept in cold frames in a position well shaded from the sun. Auricula seeds of this season have just been sown. It is difficult to get the seeds in any large quantity, but by crossing a few of the best varieties, I am enabled to obtain enough for my own needs. A few only of last year's seedlings will be strong enough to flower well next year. Alpine Auriculas are generally potted after the show varieties are done, and as they produce a much larger number of offsets, taking one plant with another, than the show varieties, the increase is greater. They are, as most cultivators know, when cultivated in pots, more hardy even than the others, the plants being exposed freely to heavy rains, which is beneficial rather than injurious to the foliage. We protect the show varieties from rain because of the smeared appearance rain gives to the powdered leaves. Alpines planted out in the borders and rock garden have grown, with us, very vigorously this season, perhaps the more because of the rich surface dressings applied to them in the spring months. These alpine varieties must not suffer from want of water during warm dry weather. The plants will become crowded with offsets, and these should be removed, so as to give the main crowns a better chance to develop.

CARNATIONS AND PICOTEEES.

I wrote at p. 752 of the last volume upon the treatment of seedling Carnations. Ours are now planted out where they are to flower next year, on deeply-worked and well-manured ground. The plants are doing very well where the maggots have not eaten the hearts out of them, but this year we have great difficulty to preserve the plants from this

pest; it is the larvæ of a blackish fly, *Hylemia nigrescens*, and it is, unfortunately, very widely spread now—and I know of no way in which we can preserve our valuable plants from its ravages except by watching the plants, and picking the maggots out with a penknife. The border varieties are early to flower this year, and the flowers are of very good quality. There are traces of thrips on some of the flowers, both in the border, and on the plants grown in pots; and although we have used every precaution to keep them clean, this lively little insect is very persistent in its attacks on the plants, and syringings twice daily, with frequent applications of tobacco-powder, have not altogether effaced them. They take the colour quite out of the petals in places, and cause the margin to decay.

Preparations must very soon be made for layering. The layers must be pegged down into sandy soil. I use for this purpose a mixture of equal parts loam, leaf-mould, and coarse sand; and, in preparing the layers, I find the work is expedited by using a thin-bladed two-edged knife, which is thrust through the stem of the layer immediately above a joint, cutting swiftly downward and outward. Cut the part of the layer off that is under the joint, and peg down at once into the prepared sandy soil. The stem must not be cut more than half through, and the layers should be made sufficiently firm to prevent their swaying in the wind; if the cut is made too deeply, they are also liable to snap off. All layers too high upon the stems should be put in as cuttings; they will form roots if kept under close hand-glasses, and shaded from bright sunshine. Fertilising to produce seedlings of merit should also be attended to. The florists have notions upon this subject which do not find favour with every admirer of the Carnation. Many ardent lovers of hardy garden flowers say they do not like the stripes and flakes of colour irregularly formed upon the petals, but they prefer selfs of rose, crimson, scarlet, yellow, &c. In that case, such varieties must be chosen as seed and pollen bearers, although we get truly handsome selfs from the Picotees and flaked Carnations. Much disappointment is caused by amateurs fancying that out of a packet of seeds, a lot of fine double flowers is to be produced; but the chance of getting varieties superior to any yet in cultivation is very remote in such cases, but there is a chance to get good varieties if care is taken to fertilise only the best of one's own plants of the different classes of flowers. The pollen is to be sought for, and will be found attached to a slender filament amongst the petals. The stigma which projects from the centre of the flower is very prominent, and resembles a pair of horns. The pollen should be collected with a small brush, and applied to the slender hairs attached to the style. If the pollen be moist and sticky, as it sometimes will be, it is worthless. It can only be used with proper effect when it is in a state of a fine dry yellow powder. If the application of the pollen is followed by the speedy fading of the flowers, it is proof that it is effectual; and should fading not take place within two days, the bloom should again be touched with the pollen.

THE BORDER PINK.

I wrote pretty fully upon the propagation and culture of this flower at p. 752 of the last volume. The raising of seedlings was not alluded to, but that is a part of the culture of Pinks which requires considerable attention. The pink is altogether a hardy garden flower, and a beautiful one, and the laced Pinks are as well adapted for border as for pot culture. Indeed, they do not produce regular facing if grown in flower-pots and placed under glass to open; under these conditions the lacings sometimes disappear altogether. See that the propagation of Pinks from pipings is seen to at once without delay, if not already done.

What are termed forcing Pinks are altogether different from the laced varieties in the treatment they require. I advised the cuttings to be put in as early as March, and that the young plants produced from them should be planted out in the open ground as soon as they are large enough. We keep the

ground quite clear of weeds by using the Dutch hoe as often as necessary between the rows.

PANSIES AND VIOLAS.

Cuttings should be put in at the first favourable opportunity, in order that good strong plants may be obtained for flowering early next year. They are sometimes thickly covered with a species of aphid of a reddish tint, to destroy which the cuttings should be dipped in soft-soapy water, to which a little tobacco liquor has been added. When the cuttings have laid in this mixture for half an hour, wash off the insects with clean water, and stick the cuttings out in a shady sheltered corner that is not overshadowed with trees. The small slender growths produced at this season from the centre of the plants, if pulled out by the hand with some few roots attached, are the best; but Pansy cuttings soon form roots, even when none is attached to them. *J. Douglas.*

A TRAVELLER'S NOTES.

(Continued from p. 12.)

LAHORE.—The town of Lahore—a large station, being the capital of the Punjab—the seat of the Lieutenant-Governor, Secretariat, &c., and other government officials, has a large European population. There are a few fine modern buildings, but the native portion of the town is dirty and uninteresting. Meean Meer—a large military centre—one of the most unhealthy in India, and that most dreaded, I am told, by the British soldier, is situated but three miles off. The most interesting places in and around Lahore are the Kalimar Gardens (the abode of love), the mausoleum of the Emperor Jahangir at Shah Darrah—the Jumma Masjid—and the fort, containing a fine armoury and some ancient buildings.

The Kalimar Gardens, some 6 miles out of Lahore, consist almost entirely of groves of Oranges and Mangos—chiefly the latter. They are let for a fixed sum by the Government to a native whose father rendered some service during the mutiny, and he makes what he can of the fruit. The Mangos probably do well here, as they are sheltered and looked after, otherwise they will not do so far north. They have quite disappeared from the ordinary landscape, which is singularly uninteresting.

The Agri-Horticultural Gardens at Lahore are worth seeing; they are 169 acres in extent, and maintained by Government for exactly the same reason, and on the same principles, as Saharanpur. These two places are, in reality, large nurseries, where plants, seeds, &c., are sold, and experiments carried on. The gardens at Lahore are in charge of Mr. Hein, a Dutchman, who has been twenty-five years in India, and which he expects never to leave. Near the centre of the garden are two halls, the Montgomery and the Lawrence—named after former Lieutenant-Governors—now used for dances and as a library. The main roads leading from several gates converge on these halls. In front of the entrance to the Montgomery Hall is a small bandstand on a circular plot of grass, the chief interest lying in the small beds which contain Crozy's best and finest Cannas, obtained direct from him. Great hedges are abundant, and nearly always consist of the yellow-berried Duranta, so often referred to; in some cases they are 8 to 10 feet high, forming thick and useful shelters. Mr. Hein has many hundreds of Chrysanthemums in pots; they usually begin to flower in November, but many scores of varieties are still to be seen. Mr. Hein has obtained seed from most European firms, but finds his own much better (as common a weakness in India as in England).

Near one boundary is a plantation of *Populus nigra* and *euphratica*, kept for supplying the hills and still colder districts. At Lahore they seldom live to attain more than 18 feet. Roses are fine; great beds are kept for cut flowers, and for obtaining cuttings for sale purposes. Between two such beds, a narrow path, lined on each side with rows of Vines, attracted my notice; they are all different varieties, and include Muscat, Frontignan, and Black Prince. They ripen well, but, with the exception of the latter, all come in together; Black Prince, however, continues in good condition, coming in first and going out last—Mr. Hein considering it the best he has. The fruit usually ripens in July. Mr. Hein tells me some of the English Peaches are good, such as Wellington and Royal George, which ripen about June; but the late ones, Barrington, Bellegarde, &c., are worthless. Inarched Mangos grow if carefully protected when young during the cold season; one or

two are wild in the garden, but they must have received protection, naturally or otherwise, or they would never have attained the size they have. It is by no means the common tree it is around Baroda, and further south generally. A few Plantains thrive, but not the best varieties—even the ordinary ones do not fruit regularly; as their fruiting season is during the cold weather, it is not difficult to understand this.

One, if not the chief, feature in this garden is a large plantation of numerous varieties of Limes, Pomelos, and in particular Oranges—the collection especially of the latter is large—we tasted many and found great variety in flavour; it was a splendid sight, the Orange trees being literally weighed down with fruit. The Pomelos—a huge fruit, with large Bean-shaped seeds, and flesh much resembling a coarse Orange—were better than I had ever tasted them, and most refreshing. The flesh of the different varieties varies in colour from pale pink to dark carmine. A cartload of common Limes is worth 4d., but the Oranges obtain a good price. These are usually propagated by inarching, the operation being performed in March just before the rains, when the sap is up.

The vegetable garden is large, and of considerable importance from the salesman's point of view; all kinds do well, and country-saved seed is found to be thoroughly good, but nevertheless a fresh strain from home from time to time is obtained.

There are some fine individual specimen trees; *Dalbergia Sissoo* is common in the garden, as are large and graceful trees of *Casuarina muricata*. This is a common tree round Lahore, many roads being lined on either side with fine specimens. The *Dalbergia* wood is found to be the best, next to Mahogany, in the district for furniture. The Mahogany itself will not do so far north. Other good trees are *Acacia stipulata*, whilst *Cassias* with long brown seed-pods are most numerous. A fine-foliaged tree is *Terminalia bellerica*, with large ovate leaves and reddish midrib, as well as *Aleurites moluccana*, the American Candle-nut tree, the seeds of which, hard as a nut, and somewhat resembling a Mango, are full of oil, especially beneath the outer rind; the natives remove this, and roast the interior for eating. The leaves of this tree are most handsome, often 1 foot wide, and the exact shape of those of *Acer Pseudo-Platanus*. It is rather too cold at Lahore for *Poinciana regia*, so fine at Bombay; but a nice tree or two are about—one in particular in front of the Montgomery Hall. *Pinus longifolia*—of which there is a nice row near the Halls—flourishes and forms handsome trees, often 60 feet high. Not far distant from this are two splendid specimens of *Eucalyptus globulus*, both over 100 feet high. *Neem* (*Azadirachta indica*), will not thrive in the gardens, it being rather too wet—but in the camp at Meean Meer—3 miles away—they are found. This tree—next to the Babool, *Acacia arabica*, is one of the commonest trees in North India.

Bougainvillea speciosa and *lateritia* are fine here. *B. glabra* I did not see much of—the first two named are well sheltered under straw mats in the cold season; in one part of the garden a particularly fine piece of *B. lateritia*, some 10 feet high, and nearly as much through, is literally covered with flowers under its straw protection. I have never seen one so fine anywhere. *Calliandra hemitoxylon* is a pretty flowering shrub; in the Jeypore Park I saw a particularly fine plant; it only differs in flower from *Metrosideros floribunda* in having round heads instead of long racemes—in colour the two are almost identical—the foliage is small and pinnate, drooping at night, when the pinnae close, as in *Mimosa*. *Calamus Royleana* and *C. Roxburghii* are both represented, though small, being scarcely more than 6 feet high—they have not yet been long in the garden, but it is not likely they will grow with the luxuriance they do at Saharanpur. *Acalyphas*, *Crotons*, *Dieffenbachias*, and all that class of plant, will not live outside in the cold weather, and *Dracenas* lose their colour and get shabby—accommodation for such is provided in a long, low grass-roofed house. *Grevillea robusta* is good, as is also *Cupressus sempervirens*, some specimens of which, standing tall, erect, and solitary, are 30 feet high. A native of Australia, *Brachychiton populneum*, with small acuminate, Poplar-like foliage, forms a graceful pyramidal tree, from 60 to 70 feet high. The best Palm is in itself really a fine specimen of *Sabal columnaris*, about 20 feet high, with large broad leaves almost bending to the ground; it is a fine sight. The plant is said to be twenty-five years old. *Oxalis rosea*, *alba*, and *variabilis rubra*, are prettily cultivated in pots, and flower profusely.

Mr. Hein tells me he has a white *Thunbergia lauri-*

folia obtained in this wise:—A blue one seeded freely, the seeds germinating, and eventually flowering all round the mother-plant, everyone bore white flowers. Unfortunately, next year a big tree fell on the parent plant, killing it; the white-flowered seedlings, however, lived, and Mr. Hein tells me he has distributed them throughout India. *Ficus elastica* grows, and makes fair-sized trees; but, after Ceylon, or even further south in India, it is not a very impressive object.

Mr. Hein pointed out to me a tree which he considers makes more wood than any other in the garden; the quantity formed is certainly surprising. The tree branches most freely, and hence its value, apart from ornamental purposes, which is considerable. The tree is *Pistacia integerrima*, a native of the Hill districts; the foliage is pinnate, with acuminate pinnae.

There is a great difference in the class of trees growing at Lahore, and even at Sabaranpur. Many that are common at Bombay, and even at Baroda, are unrepresented further north.

The further north one goes, the less interesting and the less varied becomes the vegetation in the parks and gardens. The vegetation of the open country would hardly exist were it not for the Baboos; and at Delhi were it not for the Nim trees, there would be scarcely any at all. By travelling at night through India one loses nothing. When I have been forced to go by day I have found it is most uninteresting and wearisome; for miles nothing is noticeable but Baboos on a sandy dried-up plain. Here and there a few acres are under cultivation, a mud village not being far off, whilst dry watercourses (often as broad, and I have seen some broader, as the Thames at Westminster Bridge) are occasionally crossed by low bridges. The difference from Ceylon, with its luxuriant rampant vegetation literally on all sides, is most marked.

DELHI.—The old city is most interesting; one passes in reality through the remains of seven cities, all now remaining being heaps of stones, old mosques, and tombs. One can readily believe when the old kings reigned here the area covered by buildings was as large as London is at the present day. At Lalkot, one of these cities, the most curious thing, and probably the finest in India, next to the Taj, is to be seen. It is a pillar known as the Kitub Minar, 212 feet high, the top being reached by 378 steps; it tapers from a diameter of 50 feet at the base to 9 feet at the top; it is built of red sandstone; the exterior is all semicircular and rectangular convex flutings. It was erected 650 years ago, but the huge letters of the Koran, with which it is encrusted, stand out as fresh as ever. It was a tower of victory, and it certainly soars above everything for miles round; from Delhi, 11 miles distant, it is distinctly visible. *James H. Veitch*.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

WINTER-FLOWERING STOVE PLANTS.—*Thyracanthus rutilans*, plants which have been cut back, may, when they have started well into growth, be repotted, using pots not larger than 10 inches in diameter. Young plants, that is, those which were struck from cuttings in the past spring, will have ample space in 7-inch pots. A good compost for this plant consists of loam three parts, and one each of leaf-soil and decayed manure, with sand in proportion. It is not advisable to stop the shoots too often, or the plants will not attain the desirable bush form.

SCUTELLARIA MOCCINIANA.—The plants which were struck from cuttings in the past spring, as soon as they are sufficiently rooted, should be repotted in 6 or 7-inch pots, making use of a compost identical with that given above. A week or longer after potting, the points of the leading shoots ought to be pinched out, so that lateral growths may push, repeating the pinching when the resulting shoots have made four leaves; which amount of stopping will generally be found sufficient, two or three shoots starting from each one that is stopped. *Scutellaria mocciniana* should thrive well under ordinary stove treatment.

SERICOGRAPHIS GHIESBRECHTI.—This being a plant that attains only moderate dimensions, 7 or 8-inch pots will be large enough for all the young plants; but those which flowered last year, and were cut back afterwards, may, after they have broken,

and the shoots are about 1 inch long, be shaken out, and repotted in pots smaller than those that they bloomed in, a larger shift being afforded at a later date. Supposing that the shoots have been stopped once, and that a little growth is made after the first repotting, the points may be stopped once more, which will generally be found sufficient. As the flower of this plant is of somewhat thin texture at the best, it is essential that the plant should be grown in as light a position as possible, the thorough ripening of the wood being a great point in obtaining flowers of the greatest substance.

HERBACEOUS CALCEOLARIAS.—Seeds of the above should be sown at once. Sow the seeds thinly, as if the seedlings are allowed to become too crowded in the seed-pans, they become weakly before they are large enough to prick off. Finely-sifted loam should be used for the seed-pans, making it light with a sufficient quantity of silver-sand and leaf mould.

POTTING STOVE PLANTS STRUCK IN THE SPRING.—The plants which were struck in the spring-time from cuttings should be potted on without delay, and encouraged to grow quickly, viz., *Bougainvilleas*, *Allamandas*, *Pandanus*, *Francisneas*, *Crotons*, and *Ixoras*. The essential points in the culture of all of these plants are, to employ good potting composts and afford sufficient pot-room, so as not to cramp the roots from the first. A grave mistake often made is to starve them in the cutting-pots, from which they seldom quite recover. Let the pots be clean and dry before using them, and the various composts got in readiness before commencing operations, as it is on the proper attention being given to these small details that success in great measure will depend.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

STRAWBERRY PLANTS for pot culture should now be ready for their shift into 6-inch pots, and where this is the case, the work should be done at once. The soil I prefer is a mixture of strong turfy loam, leaf-mould, spent Mushroom-bed, and a quantity of wood-ash. In potting, make the soil firm with a rammer, and afterwards stand the pots on boards in a sunny position, and give a good watering to settle the soil round the roots. When runners make their appearance, cut them off, and afford liberal supplies of superphosphate when the roots of the plants have reached the sides of the pots, and later on nitrogenous manures may be used. If the weather be favourable to ripening of the crowns, a dewing over with the syringe on the afternoons of bright days will prove an aid to growth and a check to red spider.

FIGS grown on back walls of late vineries and Peach-houses should now have their shoots stopped, if in a vigorous state of health; this check will tend to the early ripening of their wood, and although heavy crops cannot be expected from plants in such positions, yet a nice gathering of fairly good fruit may be obtained the following year, when this item in their management is attended to. The stopping of growth in houses entirely devoted to Fig culture should now be discontinued, except in the case of strong and unfruitful wood, when another pinch will be a benefit in the direction of their fertility. Feed with an unsparing hand all trees bearing well, but avoid using nitrate of soda and superphosphate together.

PINES.—Throw out all plants from which the fruit has been cut, unless they are bearing suckers that will be required in autumn, and fill up the vacancies from the succession-house. Give plants in fruit a little kainit at every watering. It may either be mixed with the water, when it will be most evenly distributed, or sown on the top of the soil and washed in. In either case, the quantity applied may be augmented weekly until the fruits are ripe.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

SUBTROPICAL BEDDERS.—These consisting, for the most part, of plants raised from seed, and which grow with rapidity, should be kept in an uniformly moist state as far as the soil is concerned. The frost which we had about the middle of the last month slightly injured the young leaves of *Cannas* and a few other subjects, but they have since that date made great progress, and the damaged portion of the leaves having been removed, they now show no signs

of the injuries. Ricinus experienced no check, and the plants are developing large leaves, which range in colour from dark green to rich bronze, and show off to advantage above a groundwork of blue and yellow *Violas*. Tall-growing plants, which are liable to be injured by wind, should be made secure from time to time to stout stakes, doing this in such a way so as not to spoil the natural habits of the various plants, or make the stakes, &c., too prominent. With a view to developing compactness of growth and diversity of form, pinch the points of the leading shoots of a portion of such plants as *Cannabis gigantea*, *Acacia lophanta*, *Abutilon*, *Eucalyptus citriodora*, *Grevillea robusta*, and *Gunnera scabra*.

ROSES.—These, notwithstanding the exceptionally dry and untoward character of the weather experienced during the months of April, May, and June, have been, and are still (hereabouts, at all events,) very satisfactory, the blooms being of good size, solid, and generally well formed, and the foliage rich and clean, this being the case not only with trees growing in mulched beds, but in the case of standards growing in borders in the kitchen garden, land that is cropped with Lettuces beneath them. All the cultural attention required by the Rose at the present time is to remove spent blooms at short intervals, and rub off and pull up all the Briar shoot suckers as soon as they appear, and where the soil is light, to give an occasional good watering at the roots.

CLIMBERS.—Make secure the young shoots of every description of climbers, cutting out, wherever opportunity permits of it being done, some of the old shoots to make space for young ones, and tying the shoots in such a manner as to avoid formality. The shoots, where likely to get crowded, should be thinned-out and not stopped. To the stopping of the shoots of climbers generally are due many, if not all, of the failures to flower these plants, which are recorded from time to time; when the young shoots are stopped, lateral growths in plenty instead of flowers are produced. In tying plants, especially those that are fast growers, leave sufficient room in the ties for the shoots to grow without being restricted. Knowing by experience that this simple though necessary provision for the welfare of the plants is sometimes overlooked to the injury of the plants, I mention it here as a reminder.

RESERVE GARDEN.—In the anxiety to produce a good summer effect in the flower beds and borders, the subjects which are to take the place of the summer bedders next October should not be forgotten; the land they are planted out in should be kept clean, and the plants watered at the roots when water is needed. Remove forthwith any stray plants or spurious varieties from the beds of Pansies, &c., as soon as the mischance is observed.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

TOMATOS.—The plants of the Tomato planted at the foot of warm walls will have got established, and if strong when they were set out, a quantity of fruit will have set. A good fertiliser, cow-stable manure-water, or some artificial manure, and a mulch of rich manure may be safely applied now. When the root-run of the Tomato is restricted, the plant makes less leaf-growth than in unrestricted borders, and manures may be applied with safety. The lateral shoots should be pinched back when they can be got hold of, and the stem or stems secured to the wall.

VEGETABLE MARROWS.—If seeds of Vegetable Marrows were sown late, as was advised in a former Calendar by me, there will be some good plants to succeed those whose crop will soon be passing over. Any early Vegetable Marrows, with a good set of fruit upon them, will require plenty of water, and abundant feeding with manure-water. The leading shoots should have the points pinched out, and all fruits cut as soon as these are of a fair size, it being a mistake to allow the seeds to develop much, and small fruits are nicer than large ones; moreover, the yield is much greater.

RIDGE CUCUMBERS require, like the above, plenty of water, and feeding at the roots, top-dressing them and stopping the shoots; also syringing or sprinkling in the afternoon when the weather is bright and warm.

CAPSICUMS require similar treatment to these, when a good set of pods is secured; reducing the number of the latter if large ones are desired.

MUSHROOMS.—If material is available, it should now be prepared, and beds made in a cellar or a cool shed; and, although equally good Mushrooms may be gathered from beds in the open even when only a small quantity is required, but the beds being small do not retain their heat and moisture in the open air for so long a time as is the case with small beds made under cover. Besides, after this date there is more certainty of a crop from the latter that will carry on the supply till the large or autumn beds come into bearing. It is well to get a good quantity of material together in readiness for the autumn Mushroom-beds.

SALADS.—It is advisable to make now a large sowing of Lettuces for autumn supply, sowing on land well enriched with decayed manure to ensure quick growth and good-sized plants. Sow the seeds in drills, this being the most economical method for keeping the ground clean. The thinnings may be transplanted.

A large quantity of Endive seed should be sown for late use, the plants raised from this being more likely to be useful than earlier sowing. The same remarks apply to Endive as to Lettuce. If salads are in general request, a bed of Corn salad, sown at this season, will be of use. It is a plant that is readily grown, and which lasts for a long time fit for use if not allowed to get dry at the root. The broad-leaved Italian variety is the best. The Radish should find a place in the sowings made at this season, sowing the China Rose, a nice variety, one of the best for early autumn, and a good keeper. For winter use the black Spanish, a very hardy Radish, may be sown. The roots may be stored in moist soil or sand, similar to Turnips; and they may also be kept in the open ground during the winter, if protected by means of litter. Mustard and Cress should be sown as often as required.

THE ORCHID HOUSES.

By H. A. BURDECKY, Orchid Grower, Hughbury, Birmingham.

MASDEVALLIAS.—*Masdevallias Harryana*, *ignea*, *Veitchii*, and other strong-growing varieties, are usually grown in pots, and they thrive in them if the pots are small in proportion to the size of the plants, but if over-potted they never grow well. *Masdevallias*, when they are thriving, usually form one thick self-supporting mass, that holds firmly together when the compost is shaken from the roots; but should this not be the case, it may be rectified when repotting them, by holding the separate pieces which forms the plant close together in the centre of the pot, at the same time spreading the roots out evenly, and filling in rather firmly with the potting compost, taking care not to injure the roots by so doing. If after having done this, any portion of the plant is loose, it should be supported by neat sticks until it has put forth roots, when it will be able to stand alone. After repotting, carefully water the plants. *Masdevallias* should never be allowed to get very dry at the root, nor, on the other hand, afforded water in excessive quantities, the leaves being apt to drop off from either extreme. The species which belong to this remarkable and interesting genus are numerous, and a large proportion of them succeed best when suspended in small baskets or earthen pans. The *Chimera* group of *Masdevallias* should be grown in shallow Teak-wood baskets; these, together with *M. tovarensis* and *M. trochilus*, are in reality Orchids of the intermediate-house, the air of the cool-house causing their foliage to drop off or become covered with black spots. Some very interesting small-growing Orchids, which grow well with the bulk of the *Masdevallias*, are *Restrepia antennifera*, *R. elegans*, and *Nanodes Medusea*, the last-named a plant not often seen in good condition.

MILTONIA VEXILLARIA.—These plants, after making a great display, are now passing out of bloom, and may be repotted—and the sooner the better—as they are plants which require no period of rest, but they immediately commence to send forth new growths and roots. Before repotting them, they should be thoroughly cleaned and freed from thrips, that may be lurking in the axils of the leaves. The compost used should consist of equal parts of peat, broken up into small pieces, and chopped sphagnum moss, well mixed together; the pots should be one-half filled with drainage, all old materials removed from about the roots, and the plants potted rather firmly, and only slightly raised above the rim of the

pot (if raised up high above the rim, the chances are that the young roots will be unable to take a firm grip of the compost, as so much handling is necessary during the year to keep down thrips, and however carefully done, the plants are more or less shaken). The application of liquid-manure may now be discontinued for a space of time. *M. v. rubella* is a small-flowered variety that is much later, and makes a show of bloom when the others are over, and is therefore useful. *Odontoglossum Schlieperianum* is in bloom, making a pretty show; it is somewhat like *O. grande*, but not so grand, and, unlike the last-named species, it flowers before leaf-growth commences.

THUNIAS.—These have flowered well with us this year, but there are always a large number of growths on the plant which fail to carry any flowers; they should not be rested yet, but placed in an airy part of the Mexican-house, and watered and syringed as usual.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

SEASONABLE PRUNING.—This needful operation should now receive attention from the careful cultivator, and the pyramid, bush, fan, or horizontally trained, should have the useless shoots shortened to within four buds of their base, all leaders being neatly trained and secured, whilst the wood is pliable. Pyramid trees should have a piece of lath or a straight stick fastened to the main stem, and the leader tied to it; and those trees that are horizontally trained to wires should be tied securely, but not tightly. Any ties that are noticed to be injuring the bark should be replaced. Pears are usually trained horizontally or as single or double cordons, obliquely or horizontally, and it is particularly important that the leading shoots of trees that are not full grown should be secured before they get broken off by wind.

Cordons which are on the Quince stock, and whose roots, therefore, are at or near the surface, should be mulched with rotted manure, and have the breastwood cut back and the fruits freely thinned if too many, watering the plants copiously with manure-water. Apples which are intended for exhibition should be freely thinned, and have the shoots stopped and the soil over the roots mulched, &c. In orchards, Blenheim Pippin is this season carrying the best crops, and its foliage is healthy. Keep the hoe going in all cultivated plantations, so that the weeds do not go to seed.

FIGS.—Where the shoots have been thinned and properly regulated, little more will be required for the present; but if this work has been unavoidably delayed, no time should be lost in getting it finished. The shoots should be thinly trained, and any weak ones when the fruit is gathered should have the points pinched out, and all sappy sprays that are not wanted, or that will not ripen, should be cut out. Syringe the foliage occasionally, and water the roots with liquid manure if they are in restricted borders.

GRAFTS have this season taken well, and attention should be given to securing them against the wind, and all shoots which have started vigorously should be pinched at the points, at about 12 inches in length, and the main stems relieved of most of the growths that may have started. Attend to the budding of Cherries, Apricots, Peaches, Plums, Apples, Pears, &c., as soon as the buds are in a fit state; and as the buds of the previous year advance in growth, support them by tying them to the snag above the bud. In budding, take great care the wood from which the buds are to be taken is kept thoroughly moist, for if once it gets shrivelled, results will be poor. Those which do not take may be grafted in the spring.

AZALEA ROSÆFLORA—What is the history of this plant? and is the single form known? It has survived the last four or five winters without injury and without protection, except what is afforded by the partially overhanging branches of a plant of *Rhododendron Falconeri*. Its very dwarf procumbent habit and beautiful double salmon-pink flowers make it a very attractive little shrub. I also enquired as to the probable cause of the blistering in the Walnut leaves sent. I am strongly inclined to think it has been caused by a gale of wind while the leaves were still soft. *Alfred O. Walker*.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY, JULY 18—Nuneaton Horticultural.
 TUESDAY, JULY 19 { Birmingham Rose (two days),
 Tibshelf Rose.
 WEDNESDAY, JULY 20 { Christleton Ro-e.
 Liverpool Horticultural (two days).
 THURSDAY, JULY 21 { Trentham Horticultural and Rose.
 Horticultural at Worksop, High-
 gate, Barnet, and Aylesbury.
 FRIDAY, JULY 21—Clverston Rose.
 SATURDAY, JULY 23 { Bedale Rose and Horticultural.
 Manchester Rose and Pink.
 Midlothian Rose and Pansy.

MEETING.

SATURDAY, JULY 23—Royal Botanic Society.

SALES

THURSDAY, JULY 21 { Clearance Sale of Greenhouse
 Plants, at the Nursery, Castle
 Hill, Lower Norwood, by Pro-
 theroe & Morris.
 FRIDAY, JULY 22 { Orchids from Mr. F. Sander, at
 Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.4.

Food
Requirements
of the Vine.

In a recent communication to the Academy of Sciences, M. A. MUNTZ points out how, in the case of the

French vineyards, the regular application of manure has become a necessity, owing to the diminished yield and impaired quality in consequence of disease and parasitical attacks of various kinds. This being the case, says M. MUNTZ, the manuring of the Vine has to be carried out in accordance with the positive knowledge possessed as to the nutrition of plants.

A knowledge of the requirements of the Vine, that is to say, of the average quantity of fertilising substances that it takes up in the course of its development and in the production of Grapes, should serve as the foundation for the rational application of manures. It will surprise some of our readers to learn, that even in a country so largely dependent on the Vine as France, this knowledge is, with a few exceptions, not available. In France, then, as in this country, growers have been satisfied with empirical mixtures, and, so far at least as this country is concerned, we have had hitherto no reason to complain of the results. But when we consider the cost of production, as the French have to do, and as we shall have to do very shortly much more than we do now, the manurial question will come to the front. No doubt farmyard manure under certain conditions is excellent, and many of the chemical and other fertilisers advertised are, as we know from the analyses we had made of them, and from the practical results obtained, well adapted for their purpose. Still, they are generally very expensive, and, now that our home growers have to compete with growers in other countries with a better, i.e., a less

expensive climate, and a smaller wages-sheet, it behoves them to lessen the cost of production so far as they can consistently do so compatibly with the maintenance of the quantity or quality, or both, of the crop. It is just in such cases as these that the benefit of intelligent as contrasted with purely empirical cultivation comes in. Constant practice and sound tradition have in this country developed Vine culture under glass to the highest point yet attained in any country; and if the world would only stand still, and present conditions remain permanent, there would be little reason to change. But the French have found out very acutely that conditions do change, and that the purely empirical system of cultivation, excellent as its results were, is no longer adequate to meet new circumstances. The same thing is happening here.

leaves, tendrils, Grape-skins, &c., but we may give his totals. He finds that the quantities of fertilising materials represented in kilogrammes, absorbed, per hectare of Vines (say 2½ acres) are as follows:—

48·299 of nitrogen.
 13·427 of phosphoric acid.
 37·322 of potash.
 103·639 of lime.
 22·037 of magnesia.

A kilogramme is the equivalent of 2·2 lb.

The quantity of nitrogen contained in the entire yield of a hectare of Vines is represented by 300 kilogrammes of nitrate of soda. The corresponding quantity of phosphoric acid is represented by 100 kilos. of superphosphate, and that of potash by 75 to 80 kilos. of sulphate or chloride of potassium. To supply an equal

FIG. 11.—AMERICAN WONDER PEA: ONE-THIRD SIZE; PODS REAL SIZE. (SEE P. 73)

Foreign and colonial competition will inevitably tell upon the home producer, and compel him either to adjust his practice to new conditions, or to give up the contest. If he elect to go on, he will find the old empiricism, excellent as it was in its way, not adequate under the new circumstances. He must remodel it by availing himself of the resources science has placed at his disposition, and if he use them properly, he may confidently expect to save materially in labour, and in the cost of production. This brings us back to M. MUNTZ's article. This chemist tells us that the composition of the fertilisers recommended to the cultivators of the Vine are, generally speaking, not based upon any exact knowledge of the requirements of the plant, and he has endeavoured to supply the deficiency. He recognises that the conditions and requirements vary so much in different localities that no rule can be laid down as absolute; but making due allowance for variation, the principles are applicable in all cases. We cannot cite all M. MUNTZ's figures relating to the different proportions found in the various parts of the Vine-

amount of nutrient matters, 10,000 kilogrammes of farmyard manure would be required annually. These estimates are calculated on the assumption that all the produce is removed, but in practice some of the leaves remain on the land, or are thrown on the rubbish-heap, to be afterwards restored to the soil in some shape or another. The wine, the whole of which is consumed off the land, removes only very small relative quantities of nitrogen, phosphoric acid, and potash. The nutrient materials are specially concentrated in the leaves. In manuring the Vine we are feeding the foliage, whose business it is to manufacture the sugar which exists so largely in the Grapes. The proportion of nitrogen which the Vine requires to attain its full development is rather large; hence the necessity for the liberal employment of nitrogenous manures. The proportion of potash, on the other hand, is smaller than is generally supposed.

But after all, the chemical side of the question is by no means all that has to be taken into consideration. Were it otherwise, plant-growing would be a mere "penny in the slot business,"

buy your pinch of manure, apply it, and avail yourself of the finished product in due season. As it is, the water supply, the amount of sunlight and of sun-heat are of equal importance. Under glass the water and the heat can be regulated, and some day or other the electric light will be available for forcing purposes.

But granted the fulfilment of all these requirements, the skill and labour of the practical gardener will still be required to adjust and control them. The practical man will be as essential as ever, only he must know how to combine the experience of labourers in other but cognate fields of work with that of his own.

of the same colour. The thick cylindric spadix is about the same length as the spathe, to which it is adherent at the base; female flowers relatively few, with a four-parted perianth and a four-celled ovary, each cell with a single erect ovule; the male flowers are placed above the females, and occupy the whole of the upper three-fourths of the spadix. Each flower consists of three to five inseparate stamens, with no investing perianth. The plant is a native of Tucuman. Kew.

Disa incarnata, t. 7243.—A species described and figured in our columns (vol. xi, p. 619). The coloured plate shows the flowers of a more orange colour than in the specimen we saw. Introduced from Madagascar by Messrs. LEWIS & Co., of Southgate.

marshy ground by M. Delavay, and subsequently on the hills of the Shan States, Eastern Burma, by General Collett. Presented to Kew by M. H. de Vilmorin.

GARDENERS' ORPHAN FUND.—The sum of £8 6s. was obtained at the recent Croydon Horticultural Exhibition from the sale of Roses, and the amount handed over to the Gardeners' Orphan Fund. We trust this excellent method of adding to the funds of this admirable Institution, may be largely adopted under similar circumstances.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of the above was held on Monday evening last at the Caledonian Hotel, Adelphi, Mr. JOSEPH WHEELER in the chair. One new member was elected, making the number of those who have joined in the two quarters of 1892, thirty-seven. Sickness among the members has been light during the quarter, only two being on the funds at the present time. The annual dinner will take place in the last week in September, due notice of which will be given. It is proposed to present the Treasurer, Mr. JAMES HUDSON, with a testimonial on the occasion for his valuable services during the past ten years.

BORDEAUX MIXTURE.—Last season, it will be remembered, some of the trials made with this liquid for the treatment of the Potato mildew were not so successful as previous experiments had led us to expect they would be. Two special reasons for this occur to us, one that the mixture was not properly made, the other that the copper deposit was washed off the leaves. M. GIRARD, to whom we owe so much of our knowledge of this subject, has investigated this last matter, and finds considerable difference in the various solutions as to their power of adhering to the foliage. To prevent the copper oxide from being washed off, M. GIRARD counsels the use of:—Sulphate of copper 2 kilos, dissolved in one wooden tub; quicklime 2 kilos, dissolved in another tub; mix the two solutions, adding water sufficient to make 100 litres, and 2 kilos. of treacle, a kilo. = 2½ lbs.; 100 litres = 22 gallons.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL ASSOCIATION.—The Hon. Sec., Mr. MARK LONGHURST, informs us that the Show of the Brighton and Sussex New Horticultural and Mutual Improvement Society, will be held as arranged on August 30 and 31; and, the Brighton and Hove Chrysanthemum Show, November 1 and 2, and not on the dates previously advertised, having been altered.

ST. PETERSBURG BOTANIC GARDEN.—We are requested to state that Dr. A. F. BATALINE has been appointed Director of the Garden in place of the late E. VON REGEL, and that all communications should be addressed to the Director, Imperial Botanic Garden, St. Petersburg.

DUBLIN ROSE SHOW.—On Thursday, July 7, the annual Rose Show of the Royal Horticultural Society took place in Lord Iveagh's grounds, and was in many respects a very successful event of its kind. The weather was fortunately beautifully fine, and the grounds never looked so beautiful. Amongst amateur exhibitors the winner of the highest prize for twenty-four cut blooms, distinct, was D. M. Wilson, Esq., Windsor, Monkstown; the winner for twelve, J. G. Nutting, Esq., Gortmore, Dundrum. The winner (a 2ad) for twenty-four Noisette or Tea Roses was S. B. Quinn, Esq., Shannon Lawn, Limerick. Mr. Nutting also took the 1st prize for twelve dark Roses, Mr. Wilson for light, and Mr. Quinn for yellow ones. Special prizes—The Challenge Plate, value £24, presented by the Horticultural Seed Trade of Dublin, and offered for the best stand of thirty-six Roses, in not less than eighteen varieties, was won by Mr. D. M. Wilson. For a stand of forty-eight, in twelve chestnut varieties, Messrs. A. Dickson & Son were 1st. A Challenge Cup or Piece of Plate (offered by Hamilton Drummond, Esq., open to amateurs only,

FIG 12.—CROSS-BRED PEA: ONE-THIRD REAL SIZE; PODS REAL SIZE. (SEE P. 73.)

PRICE OF GRAPES.—Mr. BLACKMORE writes:—"It may gratify the advocates of English fruit-growing to know, that good black English Grapes are now selling at 6d. per lb. in Covent Garden Market, and Strawberries at 1½d., punnet included! These are my last returns.

BOTANICAL MAGAZINE.—The plants figured in the July number are:—

Synandropadix vermitoxicus, t. 7242. The botanist who conferred such an appellation upon so handsome a plant ought to be condemned to write it on a tally a few hundred times in succession. Next time he would probably select a shorter if less expressive name. The plant is a "noble" tuberous-rooted Aroid, with stalked hastate leaves, produced with the spadix. The spathe is stalked, boat-shaped, acuminate, widely spreading, rose-coloured, with darker stripes

Gynura sarmentosa, t. 7244.—A climbing perennial of loose spreading habit, with purple stem, stalked, lanceolate, glabrous, remotely toothed leaves and cylindric heads of flowers disposed in loose cymes. It is a Composite with purple involucre bracts and yellow flowers. The plant is a native of the Malay peninsula and islands.

Masdevallia leontoglossa, t. 7245.—A species with short flower-stalks, bell-shaped flowers, 1½ inch long, dividing to below the centre into three lanceolate acuminate segments, greenish externally, rose-coloured, with darker spots on the same colour within. See *Gardeners' Chronicle*, 1881, vol. xv., p. 234.

Primula Forbesi, t. 7246.—An annual species, with long-stalked pilose leaves, and tall, slender flower-stems, bearing remote whorls of pale pink flowers. It is a native of Yunnan, where it was found in

value 21 guineas, with £5 added annually.—1st, Mrs. Robertson, of Gledswood, Dundrum; 2nd, Lord Ashdown, Woodlawn, county Galway. A special prize, for the best group of foliage and flowering plants, staged for effect in a space of 10 feet by 5 feet.—1st, Mr. J. G. Nutting, Gortmore, Dundrum; 2nd, Viscount Gough, St. Helens, Booterstown.

SCOTTISH HORTICULTURAL ASSOCIATION.—The monthly meeting of this Society was held on July 4, the chair being occupied by Mr. ROBERT MORRISON, one of the vice-presidents. On the conclusion of the formal business of the meeting, a paper by Mr. ALEX. HUTTON, Dundee, was read, the subject being the "Flora of Ceylon." The following were the exhibits:—From Mr. HENDERSON, Cermiston, blooms of a very fine seedling white Begonia Pearl, and Streptocarpus hybrids; Mr. CHAPMAN, Easter Duddingston Lodge, sent blooms of several herbaceous plants; and Mr. A. McMILLAN, Trinity Cottage, a plant of Japanese Chrysanthemum Puritan, in flower, the flower-stem being but 13 inches high; also fine blooms of Chrysanthemum Sandflower, Madame Lacroix, and Madame Desgranges, and a plant of Lilium giganteum.

SEWING MACHINES.—From Mr. ALLEN, Ave Maria Lane, we have received a pamphlet on the "Birth and Development of the Sewing Machine." Such a history should be of interest to every gardener's wife, who should receive with pleasure the news that the sewing machine of the near future is to be so constructed as to work either lock or chain stitch at will. The same machine executes also an embroidery stitch, which has much the same effect as chain stitch, but is worked with thread of two colours. It is indeed, more like a fine braid than embroidery.

PEAR, BROCKWORTH PARK.—M. BURVENICH, and also M. BALTET, whose competence in such matters all will admit, say that this Pear, which was found growing against a wall at Brockworth Park, near Gloucester, and which was certificated by the Royal Horticultural Society in 1871, is synonymous with Bonne de Ezeé.

NEW GUINEA RHODODENDRONS.—We notice in *Engler's Botanische Jahrbucher*, vol. xvi., 1892, the description by Dr. O. WARBURG of several new species of Rhododendrons from the German portions of New Guinea; R. Zoelleri, in particular, seems a species for which our nurserymen and hybridists should be on the look out. The flowers are said to be golden-yellow, and of large dimensions. R. Herzogi is remarkable for its very long tubular flowers.

DR. SCHÜBELER.—The death of this distinguished botanist took place on the 20th ult. He was the Director of the Botanic Garden, Christiania, and well known for his publications on the Flora of Norway. Of these, his *Cultur Pflanzen Norwegens*, and his *Die Pflanzenwelt Norwegens* are full of interesting details on the distribution of plants in Norway. An English version of one of these publications was published in 1862, under the title of *Synopsis of the Vegetable Products of Norway*.

"HISTOIRE DES PLANTES."—M. BAILLON'S great work proceeds steadily. The last part contains monographs of Primulaceæ, Utriculariaceæ, Plombaginaceæ, Polygonaceæ, Juglandaceæ, and Loranthaceæ. We are under the impression that in the recent parts morphological details have not been attended to so fully as in the earlier portions. What will attract special attention in the present instalment, however, is the monograph of Loranthaceæ, which is made to include the Olacaceæ, Styracaceæ, Santalaceæ, Vitaceæ, and several other groups not usually associated with Loranthaceæ. Botanists will need to keep their minds open and receptive to grasp some of these arrangements.

STOCK-TAKING: JUNE.—The Board of Trade Returns for the past month have not a particularly inspiring appearance on the first survey; a heavy decrease in both branches of trade. Imports and exports are not calculated to do other than "give

pause" to all who month by month "take stock" of the nation's progress. But there may be compensations. The imports for June are less in value by £1,038,270 than they were in June of last year; but then the Whitsuntide holidays occurred in May, so that the comparison does not hold good to-day; and trade in the first six months of last year was not quite normal in condition. Besides, though values have declined, the fact is largely due to the fall in prices, wheat and cotton, &c., to wit. A look at the average of prices of Corn last week, and for the corresponding week in 1891, may be given in proof; though it is perhaps a remarkable fact, that heavy as is the reduction in the price of Wheat, the baker's bill does not give the slightest evidence thereof; and as for Cotton, are not they laying out an immense area in Asiatic Russia for the cultivation of the plant? All the above should be taken into consideration whilst summing up, and a note may be made of the fact that the imports for the six months just ended show a gain of £358,558 over the values for the corresponding period last year. The following excerpts are from the "Summary" of the imports of foreign and colonial products for the month of June:—

IMPORTS.	1891.	1892.	Difference.
	£.	£.	£.
Total value for month	£36,850,124	£32,811,854	-4,038,270
§II.—(A.) Articles of food and drink—duty free	13,354,112	13,323,161	-30,952
(B.)—do., dutiable	1,873,006	1,421,963	-451,043
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	6,493,954	4,425,526	-2,068,428
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,963,939	3,685,785	-278,154
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,111,061	908,295	-202,766
(B.)—Parcel Post ...	44,987	35,214	-9,773

It is, perhaps, worth noting that the only item showing an increase is that of Tobacco! From the general figures we call the following, relating to the imports of fruits and vegetables during last month:—

IMPORTS.	1891.	1892.	Difference.
Fruits.—			
Apples, raw ... bush.	64,034	71,672	+7,638
Cherries		115,918	+115,918
Plums		6,103	+6,103
Pears		23	+23
Grapes		3,398	+3,398
Unenumerated, ..	213,164	93,535	-119,629
Onions bush.	259,742	132,926	-126,816
Potatoes cwt.	893,056	794,081	-101,975
Vegetables, unenumerated, raw, ... value	£117,681	£110,399	-£7,312

We are laying out with the foreigner so immense a sum every month for articles of food, that this may not be an inopportune moment for stating that more than one-fifth of all Ireland is uncultivated; Connaught, its smallest province, containing 1½ millions of unreclaimed acres. The possibilities of food supplies from these acres when brought under agricultural domination are something enormous.

THE EXPORTS

show a decrease of £3,364,081 as compared with June in 1891—the loss in the six months being £12,205,250—there being but one trifling exception in the decrease column. This has not a healthy look about it, and is to be deplored; but then price has had to give way as well as volume—profit has had to suffer as well as the amount of labour remuneration. We may just note here that the exports of foreign and colonial produce continue to increase, which is on the side of our shipping interests. The mention of shipping re-

minds us that the gross tonnage of ships under construction in the United Kingdom—mercantile, we mean—is 778,462, including 165,183 tons for the colonies and foreign states; France, Germany, and the United States have building (premiums being paid the builders) only 81,028 tons of shipping. So it seems alarm has not reached our merchants and ship-builders under existing commercial conditions.

"DIE NATÜRLICHEN PFLANZENFAMILIEN."

The orders treated of in the last number of this publication are the Coriaceæ and Anacardiaceæ, by Professor ENGLER; the Buxaceæ, by Dr. PAX; and the Limnanthaceæ, by Herr K. REICHE. The rapidity with which this publication appears is a compensation for the perplexing irregularity of the sequence. As the work proceeds, it becomes more and more a subject of regret that the diagnoses at least were not written in cosmopolitan Latin. Perhaps, when the work is completed, an appendix may be issued, giving a summary of the ordinal and generic characters in Latin.

THE OXFORD CARNATION AND PICOTEE UNION.

—The annual exhibition of this Society is now definitely fixed to take place in Mr. DODWELL'S garden, Stanley Road, Oxford, on August 2. It was Mr. DODWELL'S desire to make the date of the show the 28th inst., in order not to clash with the exhibition at Earl's Court, which opens on August 1, but the midland growers, who show largely at Oxford, have made a representation to the effect that their flowers will not be sufficiently advanced by the 28th; and the exhibition will now take place, as usual, on the first Tuesday of August.

WARE.—A show was held at Ware on Thursday, the 7th inst., in the gardens of the Priory, kindly lent for the occasion by R. WALTERS, Esq. The schedule was an extensive one, but amateurs did not respond to the invitations to compete in such large numbers as was anticipated, but on the contrary cottagers came out strongly. Several nurserymen in the district sent non-competitive exhibits. The strong features of the show were fruit, Roses, especially Teas and Noisettes, groups of plants, hardy herbaceous and stove and greenhouse cut flowers. The secretaries of this, the youngest horticultural society near town, are Mr. FULFORD and Mr. J. ROGERS, junior.

A GIANT TODEA BARBARA.—One of the special features of interest during the tercentenary celebration recently held at Trinity College, Dublin, was a splendid specimen of this Fern, recently received from Baron Sir FERDINAND VON MUELLER, of Melbourne. Its weight was computed at 3000 lb., and it was consigned to the care of Dr. ED. PERCEVAL WRIGHT, F.R.S., the Professor of Botany in the Dublin University, as a "peace offering," owing to Baron VON MUELLER being unavoidably prevented from accepting a special invitation to be present at the tercentenary celebrations. This enormous Fern was discovered a few months ago in a narrow ravine in one of the ranges between Port Phillip and Gipp's Land, and was only dislodged after much difficulty. It was carefully taken up, all its umbrageous fronds were cut away, and being then securely boxed up in a large case of Eucalyptus wood, and shipped on a mail steamer of the Peninsular and Oriental Line, it reached Dublin in safety a day or two before the celebration began, and, as we have said, was a source of much interest to the numerous visitors on that occasion. Baron VON MUELLER writes as follows:—"These Todeas will only endure slight frosts, and they like some irrigation. During my forty-five years of uninterrupted researches in Australia, I have only met with about ten gigantic specimens of Todea, and I do not know of any place where one would be likely to find good specimens weighing over a ton, and even small specimens are uncommon anywhere. What may make this particular Todea of special interest as 'a memorial plant' is the likelihood of its having begun its career from a spore about the time when the University of Dublin was founded, viz., in 1594." During its voyage from

Australia numerous new fronds had grown to the length of about a foot, and the specimen was to all appearance as fresh and as vigorous as when taken out of the gully in which it was found. Such a novel and valuable lift is deserving of especial welcome and every good treatment, and it is proposed to build a special cool Fern-house for its reception, where it is to be hoped it may long remain in health and beauty as a memorial of the great centenary celebration of the University, and of Baron VON MUELLER's good will and generosity in sending such a welcome addition to the treasures of the University Botanical Garden. It has long boasted of two splendid specimens of Grass Gum trees (*Xanthorrhoea*), and of the gigantic Spear Lily of New South Wales (*Doryanthes excelsa*), which has quite recently flowered in the gardens for the second time.

WOLVERHAMPTON HORTICULTURAL EXHIBITION.—The fourth annual exhibition of this very flourishing Society took place on the 12th, 13th, and 14th inst., in the public park, Wolverhampton; and, although it is a somewhat hackneyed expression to say it was "the finest exhibition the Society has yet held," it is nevertheless true. It was a grand exhibition all round, and at present we can only note a few of the leading prize-winners. In the class for sixteen stove and greenhouse plants, Mr. Cypher, Cheltenham, was 1st; Mr. Alderman Marriott, Coventry, 2nd; and Mr. Currey, Salisbury, 3rd. Mr. Cypher was also 1st for six plants in flower, for six fine foliage plants, for eight exotic Orchids, and for six Palms. Some superb groups were set up, Mr. Cypher taking the 1st position very easily with a superb group of an irregular square form. The magnificent display of Roses was a surprise to everyone. The chief exhibitors were Messrs. B. R. Cant, F. Cant, Harkness & Sons, The English Fruit and Rose Company, Prior & Son, Cooling & Son, Henry Mereweather, Perkins & Sons, Alexander Dickson & Sons, and the Rev. J. H. Pemberton. For seventy-two Roses.—1st, Mr. B. R. Cant; 2nd, Mr. Frank Cant; 3rd, Messrs. Harkness & Sons; 4th, The English Fruit and Rose Company. Messrs. Perkins & Sons were 1st for bouquets. We may be in a position to give our readers a fuller account of the show next week.

JULY HORTICULTURAL MEETING AT GHENT.—Certificates of Merit were awarded for the following plants:—1st, *Streptocarpus grandiflorus*, var. nov., from M. Ed. Pynaert Van Geert; flowers double the usual size, the specimens were abundantly flowered, the blooms clustered in a fine bunch. 2nd, *Cliveia* Dr. H. Van Cleemputte (*miniaturum* × *robustum*), to M. Poelman Maenhout; fine flowers of bright colouring. 3rd, *Miltonia vexillaria leucoglossa*, to MM. Edm. Vervae et Cie., large and fine flower; a good variety. 4th, *Cypripedium Crossianum superbum*, to M. J. Hye-Leyden. 5th, *Oncidium Karwinski*, to the same; flower greenish, with large brown spots, lip white, with purple lines. 6th, *O. lanceanum*; also to the same, fawn-colour, streaked with crimson, and bordered with greenish-yellow, lip rosy-lilac, very pretty. 7th, *Odontoglossum Pescatorei sulphureum*, to the same; bulbs those of *Pescatorei*, flowers small, greenish-yellow, marked with brown. 8th, *Cattleya Mossiae alba* (Wagneri), also to the same; rare and much admired. The cut Roses from Mille. Guequier included the best varieties known. Certificate for cultivation and blooming for:—1st, *Kentia Dumoniiana*, to M. L. Spae-Vandermeulen; a pretty dwarf plant, with graceful undulated leaves. 2nd, *Pavetta montana*, to M. L. Desmet-Duvivier; an excellent specimen. 3rd, *Dendrobium filiforme*, to M. J. Hye-Leyden; charming specimen, with fifteen clusters of flowers. 4th, *Stanhopea*, with five fine clusters to M. Ad. D'Haene. Botanical Certificates:—1st, *Asparagus falcatus*, to MM. Duriez Frères; a pretty and curious novelty. 2nd, *Carludovicia palmifolia*, to M. L. Desmet-Duvivier; a most curious plant, with the stem covered with adventitious roots, foliage very fine. Honourable Mention to:—*Lælia purpurata*

var., with purple petals; *Adiantum hybridum*, fragrantissimum × *decorum*, from M. Arthur Vanden Heede; *Oncidium ornithorhynchum*, from M. J. Hye-Leyden; *Cypripedium barbatum*, from the same; *Adiantum fragrantissimum* and *A. gracillimum*, from MM. Duriez Frères.

CANFORD MANOR.—Mr. CRASP, Lord WIMBORNE's head gardener, has, in addition to his varied duties as gardener, been appointed forester and general estate manager over the extensive woods, &c., at Canford Manor and its neighbourhood. Mr. CRASP has made himself a name in the horticultural world as an exhibitor of fruits and flowers, including Malmaison Carnations, and notably also by the successful manner in which a number of large Conifers, from 20 to 30 feet high, have been removed from one distant part of the estate to another, and this without a single failure. Mr. CRASP's previous practical experience in the formation and management of woods will doubtless be brought to bear in the supervision of those at Canford. We had lately the opportunity of visiting Canford and its well-managed gardens, and shall probably have occasion to publish some notes concerning them.

INTERNATIONAL EXHIBITION.—Their Royal Highnesses the Prince and Princess HENRY OF BATTENBERG paid a visit to the International Horticultural Exhibition, Earl's Court, on Saturday, and were conducted through the grounds by Mr. MILNER, and Mr. H. WILLIAMS drew their attention to the collection of Orchids, Nephthes, Dionæas, &c., in the Insectivorous House.

TEXAS.—Prof. J. COULTER has issued the second part of a *Manual of the Plants of Western Texas*, prepared under the auspices of the Division of Botany of the United States of America. The present part comprises the enumeration of the plants belonging to the Gamopetalous division. This is a work so useful to the botanist, and one that entails so much care and tedious labour on the author, that the gratitude for all concerned will surely be bestowed on the author and on the officials of the department.

HABENARIA.—Dr. KRANZLIN has recently published in *Engler's Jahrbücher*, a monograph of the species of this genus, with which he includes *Bonatea*. No fewer than 318 species are enumerated, grouped in the first place according to the divisions of the lip and of the lateral petals.

PLANT PORTRAITS.

- ACACIA DEALRATA*, *Garden*, July 2.
ACER RUBRUM VAR. *DRUMMONDI*.—Leaves streaked with red on the upper surface, glaucous beneath. *Gartenflora*, t. 1374.
 APPLE, THE QUEEN, *Bulletin d'Arboriculture, &c.*, May.
COCHLIODA NOETZLIANA, *Moniteur de Horticulture*, May 10.
CYPRIPEDIUM EXUL VAR. *INSCHOOTIANUM*, *Lindenia*, t. 327.
OPUNTIA RAFINESQUIANA, *Meehan's Monthly*, June, t. 6.—The most northerly species of Cactaceæ, occurring in the United States as far north as 48°, 40'. It has larger flowers than *O. vulgaris*, with more numerous petals, and the joints of the stem are deeper green.
PERISTERIA LINDENI.—A new species described by Mr. Rolfe, allied to *P. pendula*. The flowers are globular, with green sepals and petals, suffused with dull purple, and covered throughout with deep purple spots.
PHAIUS TUBERCULOSUS, *Lindenia*, t. 326; and *Revue de l'Horticulture Belge*, July, 1892.
PITCAIRNIA FLOCCOSA, *Gartenflora*, July 1, pp. 352—353, c. ic. xyl.
SWAINSONA CORONILLIFOLIA, *Revue de l'Horticulture Belge*, July, 1892.

CROSS-BREEDING OF PEAS.

OUR illustrations of two Peas, each reduced two-thirds, figs. 11 and 12, are taken from two plants selected by ourselves on the occasion of a recent visit to Messrs. Sutton's trial grounds at Reading. They are very interesting, as showing what may be

done by cross-breeding and selection when those processes are carried out not hap-hazard, but with a definite aim in view. Early Peas are mostly small in the pod, round-seeded, and as to flavour they compare unfavourably with the wrinkled Marrows of the main crop.

Our first illustration shows a plant of American Wonder with pods of the actual size. To compare with it we took one of Messrs. Sutton's seedlings, as yet unnamed (fig. 12), reduced to the same scale. The height is not much greater than American Wonder, but the pods are as large as those of Telephone or Stratagem, or even of Duke of Albany. For the rest, the illustrations tell their own tale; but we may mention that this is only one illustration of a series of experimental crosses which have been effected with the aim of securing early Peas with larger pods. Looking down the rows, it was easy to see that the result had in many cases been attained, whilst in other cases a longer period of probation and elimination was required. Amongst the assured results is Sutton's Bountiful, which is stated to be the result of a cross between Sangster's No. 1 and Telephone. Here we have a Pea attaining a height of 3 to 4 feet, with pods coming into use two or three days later than *Invicta* or Sangster's No. 1, and with much larger pods. Messrs. Sutton consider this Pea to be specially well-suited for market garden purposes.

A cross between American Wonder and Early Paragon has resulted in a Pea taller than the Wonder, the pods ripening as early as the round-seeded class, but producing wrinkled seeds with, as we were told, the Marrowfat flavour. This is known as Sutton's A1. Of like character is *Empress of India* (Sutton), which is the result of a cross between Sangster's No. 1 and Telephone, with pods as large as those of the last-named, but a second early coming in immediately after the earliest round-seeded sorts. This also has the Marrowfat flavour. We have not space to go fuller in detail, but we counsel gardeners not to rely so much on the select dishes laid out on the exhibition table, where all conflicting and adverse conditions are necessarily out of sight, as on the actual inspection of the crops during growth, as they may readily do just now at Chiswick. Messrs. Sutton's trials, and they are almost beyond computation, afford an excellent object lesson, one as full of interest for the practitioner as for the scientist. Where such numbers, sown at the same time under the same conditions, can be seen side by side; even if the details sometimes create confusion, the predominant features are, nevertheless, readily grasped, and the intermediate gradations recognised.

Messrs. Sutton naturally take keen interest in the work, and it was pleasant to see also one of the founders of the firm (Mr. Martin Sutton), though no longer concerned in the business, still retaining his old interest in the results of the several trials, and taking intelligent pleasure in the progress of horticulture generally.

HOME CORRESPONDENCE.

SEEDS ON PLANTS.—A writer in a contemporary has endeavoured to make out that flowers are exhaustive and weaken plants, and has advocated the thinning of Peach buds with a view to the development of bigger blossoms; but few I think will share his views or follow his advice, as most people know that it is not the flowers that tax the energies of plants, but the fruit or seed, which in all cases, when not wanted, should be taken off as soon as possible after the blooms drop, and before swelling takes place. The chief strain, however, comes later on, and is greatest just before the ripening process sets in, and Peas and Beans if the pods are left on, cease bearing; and the same with most things, or they stop growth or refuse to form wood. Take *Rhododendrons*, for instance, or hardy *Azaleas*, and leave their seed pods on as against others from which they are removed, and what a marked difference you see, the latter making shoots freely and looking fresh, while the others flag or show great signs of distress. Foxgloves in the ordinary course are only biennials, but

if their seed heads are cut off early they may be made perennials; and if perennials are to be kept flowering they must be helped in like manner, and they all pay well for that attention, and especially so with Delphiniums and others of that class that form seed freely. The most expeditious way of dealing with Rhododendrons is to take the shoot in the left hand, and with the right grasp the head of seed, low down, and give it a quick bend over, when the whole bunch or truss will come away together, as it will snap at the base if the work is done while that part is tender and brittle. Pelargoniums and all bedding plants flower with much greater freedom if they are frequently looked over and relieved of their seed, as while they have it on them they have quite enough to do in sustaining and perfecting it, and to this end they need all the strength that is in them. J. S.

TRADE IN CUT FLOWERS.—I wish we could do something to establish a cut flower trade that can be relied upon. A short time back a Birmingham man wrote to me and asked me to send him a consignment of flowers weekly. I have a splendid garden, and grow a large number of all kinds of perennials; my garden is in fact a show place, and I do nearly all of it myself, as I cannot afford to pay for more than one man in these bad times, when a clergyman's income is less than half its nominal value. I thought I would try the man, and sent the enclosed list, all good stuff, well packed, choice things in tissue paper. I paid 3s. 2d. for the carriage, and he sent me the magnificent sum of 2s. 6d. for them.

1 doz. Moss Rose buds, white and red	19 doz. Pansies
1 .. Tea Rose buds	6 yellow Day Lilies
1 .. other Rose buds	10 Poppies, yellow and red
12 .. white Cluster Roses	12 Lemon Verbenas
8 .. sprays of Benthama	13 doz. fine Spearmint, just in time for lamb and Peas
1 .. white Snapdragon	And several odds and ends.
2 .. red Snapdragon	
7 .. white Pinks	<i>Second Consignment.</i>
11 .. white Rockets	34 doz. white Roses
12 .. Rock Roses	2 .. Rose buds
2 .. Escallonias	7 .. Moss Rose buds
3 .. Ribbon-grass	1 .. Bride Gladioli
1 .. yellow Lupinus	1 Iris
3 .. Single Geraniums	24 doz. Pansies
1 .. Auricula-eyed Sweet William	4 .. Geraniums
1 .. Honey-suckle	2 .. fine Canterbury Bells
8 Bride Gladioli	2 .. Marguerites, &c.

I expected nothing great, but I certainly did not expect to be a loser by it, as I know the white Roses would make four wreaths worth 5s. each, and all was saleable stuff. Now, there are many indigent ladies seeking employment, and I can think of no nicer work for them than to cut and tie flowers. If they could make up their minds to open a small shop in some good thoroughfare in our large towns, and be supplied from clergymen's gardens alone, they would be doing a good work for all concerned. The traders will not take things from us. I could have sent 10,000 Narcissus to market last spring, but I felt sure I should not get more than the carriage for them, so I enjoyed their company at home. *Reactor*. [Advertise in the local and other papers that you will supply flowers, &c., by parcel-post. We fear, however, amateur trading is never likely to be successful. Ed.]

CAIN AND ABEL.—There is an oversight in Mr. Burbidge's long discourse at p. 786, vol. xi., I mean his description "of Cain with his flocks and herds, and of his brother Abel who cultivated the fruits of the earth." This is also so stated in some other gardening papers, but is in direct opposition to the Mosaic narrative given in *Genesis*, chap. iv., v. 2, where we read that "Abel was a keeper of sheep, but Cain was a tiller of the ground." *W. Napper, Chelsea*.

ARISTOLOCHIA ELEGANS.—I lately observed a nice plant of the above species at Ripley Castle Gardens, growing on the back wall of the plant stove and on the roof, and in this position it showed off its quaint-looking flowers to great advantage. These latter are not so large as in some of the newer species, but they are freely produced on the long shoots. The plant is worthy of notice for the pretty bark of the main stems, which is corrugated after the manner of cork bark. It is a free-growing subject, Mr. Tunnington having grown the plant here noticed to its present size in two years. The fine range of glass was well-stocked with plants and fruits, all of which bore signs of the skill and attention of the gardener, as did also the kitchen gardens and pleasure grounds. Ripley Castle is well worth a visit from anyone interested in horticulture. *W. H. Divers, Ketton Hall Gardens, Stamford*.

RHODODENDRON FALCONERI.—Having seen several references made to this beautiful species of Rhododendron in these pages, a description of a fine plant we have here would also not be out of place. The plant, which has flowered grandly this season, having produced upwards of eighty heads of bloom, most of which consisted of from twenty-five to thirty flowers, of a creamy white with just a tinge of lilac colour at the base of the corolla, is 18 feet high, and 19 feet in diameter. The plant is never protected from frost. We have another, a smaller plant, which flowered for the first time this year. *W. Osborne, Heligan, St. Austell, Cornwall*.

COLOUR IN CARROTS.—Your remark as to the origin of the red colour in the Carrot is full of interest. The fact that it is an esculent of great antiquity adds to the difficulty of determining the origin of the red colour in the root. Are we quite certain that our cultivated red Carrots have been derived from the wild British species, *Daucus carota*? Ages ago—seeing that the Carrot was known to the ancients, and is mentioned by Pliny—it might have been bred up from some species of which we in the present day have no knowledge. White Carrots have been in cultivation in this country for many years; the old Long White Carrot was formerly much grown in kitchen gardens, but it has now almost entirely disappeared from cultivation. The White Belgian Carrot, which is supposed to have sprung from the form just mentioned, is our field-cattle Carrot *par excellence*, and is extensively grown for cattle-feeding. The root of this is white, but with a marked tendency towards a more or less decided yellow tinge. Was it from this yellow tinge that, by a process of persistent selection, extending over many years, our red Carrots have been derived? If this is probable, then, after all, our Carrots, white and red, may have been evolved from the wild form, and by selecting, with a view of obtaining certain characteristics scarcely normal, we have reached so many types of our cultivated Carrots. Between the Forcing French Horn and the Long Red Altringham there seems to be quite a specific difference, and yet they may have a common origin. That the colour in Carrots is maintained and deepened by careful selection is certain. In selecting Carrots to yield seed, the seed-grower is always very careful to have the roots as deeply coloured as possible. It can frequently be noticed that the degenerate stock of a Carrot is always pale in colour, and it is a fair inference that, if the selection of a high-coloured type were not persisted in, a poor pale-coloured root of inferior tint would be reached. Probably, our deepest-coloured Carrot is the Altringham, a variety of English origin, and much esteemed in the North of England. The subject is full of interest, and a solution of the problem as to the origin of the red colour in the Carrot, is made more difficult when it is remembered that attempts to improve the wild form by means of cultivation, appear to have failed. It would be interesting to know, as widening the field of inquiry, how it is the Long Red Surrey Carrot and some of the shorter types bury themselves in the soil, while the Altringham and White Belgian thrust themselves up out of it to the height of 3 or 4 inches, and consequently are quite green on that portion of the root so exposed. *R. D.*

BOOK NOTICE.

THE CHRYSANTHEMUM AND ITS GROWTH. By W. and G. Droyer, nephew, and W. Adams. Illustrated.

This new handbook on the cultivation of the Chrysanthemum is the joint work of three persons, two of whose names have acquired of recent years some amount of distinction by reason of their success as exhibitors of the Chrysanthemum all over the country. The plant is taken up at the cutting stage, and its cultivation in general and in particular as regards a certain selection of incurved and Japanese varieties is followed through the entire season. The peculiarities of certain "families" as the Teck, the Queen, Etoile de Lyon, Prince Alfred, Jeanne d'Arc, and Japs come in for special remarks regarding the important operation of "taking" the bud, or rather leaving it. These remarks being the outcome of some years of close observance of the idiosyncrasies of the plants, are well worth reading by both the exhibitor and the general cultivator.

There is a portion of the book which it seems to us might be much curtailed, and that is the chapters on the cultivation of each of forty-eight Japanese and thirty-six incurved for exhibition purposes.

The ordinary cultivator could, of necessity, pay but little heed to the multitude of directions afforded in these chapters, and his errors of omission and commission might be many if not serious. The ordinary methods of cultivation are explained in simple, if necessarily technical garden terms, and would be quite understandable even to those few growers of the flower who are not very well versed in such matters. Everything, we should suppose, that an exhibitor requires to be acquainted with from growing the plants to dressing and staging a bloom, is fully explained. We may say in conclusion, that the authors combat the idea, commonly held, that the varieties of Chrysanthemums may be ascertained by their foliage, colour of the shoots, habit, &c. Altogether, the book is a useful addition to the gardeners' library, brought well up to the present time.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 12.—The meeting at the Drill Hall, James St., Westminster, on the above date, brought a bright lot of flowers together from competitors and non-competitors, the exhibits from the former chiefly consisting of hardy perennials, Roses, &c., and those of the latter of Orchids. Fruit is beginning to occupy a larger amount of space, and some excellent samples of Pine-apples, Melons, and new varieties of Strawberries, were noted.

Floral Committee.

Present: W. Marshall, Esq., in the chair; Messrs. C. F. Bause, B. Wynne, H. Herbst, R. Owen, Norman Davis, G. Phippen, R. B. Lowe, G. Nicholson, W. Goldring, W. C. Leach, J. T. Bennett-Poe, T. W. Girdlestone, C. Noble, H. Turner, and G. Gordon.

By far the most important exhibits were those for which prizes had been offered, including the Mantell Silver Challenge Cup (value 25 guineas) in an open competition for 24 Roses distinct, three blooms of each. There were also prizes to amateurs for hardy herbaceous perennials. The stand of twenty-four Roses distinct, three trusses of each, staged by Mr. B. R. Cant, of Colchester, was magnificent, and we think they were even finer than those shown at Earl's Court last week by Mr. Frank Cant, who was 1st in honours both there and at the Crystal Palace. On Tuesday the positions were reversed, and Mr. B. R. Cant secured the 25 Guinea Cup. The following varieties were those shown:—Mrs. Paul, A. K. Williams, Madame Cusin, Marie Baumann, Jennie Dickson, Reynolds Hole, Gustave Piganeau, Marie Verdier, Suzanne-Marie Rodocanachi, Xavier Olibo, Ernest Metz, Victor Hugo, Dr. Andry, Pride of Waltham, Mrs. John Laing, Sultan of Zanzibar, Earl of Dufferin, Duchesse de Morny, Prince Arthur, La France, Comtesse d'Oxford, Alfred Colomb, Her Majesty, and Duke of Wellington. Mr. Frank Cant had also a very good stand, containing extra good Earl of Dufferin, La France, Gustave Piganeau, Pride of Waltham, Merveille de Lyon, and Alfred Colomb. Messrs. Paul & Son, Old Nurseries, Cheshunt, had good specimens of Her Majesty, Earl of Dufferin, Madame Victor Verdier, Catherine Mermet, Marie Rady, and Maurice Bernardin.

In the class for eighteen bunches of hardy herbaceous perennials, the Earl of Dysart, Ham House, Richmond (gr. G. Sage), was 1st; he had a very pretty collection, including a bunch of Sweet William, which was the subject of much criticism, as not being a herbaceous perennial. He had also *Lathyrus latifolius*, *Erigeron speciosus*, *Eryngium amethystinum* and *E. giganteum*, *Clematis erecta*, *Coreopsis lanceolata*, *Scabiosa caucasica*, *Campanula persicifolia*, fl.-pl.; *Gaillardia grandiflora*, *Centaurea macrocephala*, *Lilium caudatum*, &c.

For twelve bunches, H. Berkeley James, Esq., Carshalton, Surrey (gr., J. Gibson), was 1st, who had *Lilium*, *Irises*, *Delphiniums*, *Galega officinalis*, *Achillea Ptarmica*, *Larkspurs*, &c.; W. Marshall, Esq., Auchenraith, Bexley, was 2nd, included in his exhibits were the useful and bright *Monarda didyma*, *Lionaria peloria*, which was awarded a First-

class Certificate; and *Campanula persicifolia* *semiplena*, which obtained an Award of Merit.

Miss R. Debenham, St. Peter's, St. Albans, was 1st for eight bunches.

NON-COMPETING EXHIBITS.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had a large group of hardy herbaceous cut flowers, including *Lilium Brownei*, *helveticum*, *delmaticum*, *pardalinum*, and *Bloemerianum magnificum*, which obtained an Award of Merit; *Achillea Ptarmica* (The Pearl), *Lilium maritimum* (Botanical Certificate), *Gaillardia Aurora*, which was the recipient of an Award of Merit; and *Calopogon pulchellus*, which was awarded a First-class Certificate. This is a very pretty little plant, and although it is nearly 100 years since it was first introduced, it is very rare even now; it grows about 1½ foot high, the flowers are pinky-purple, and borne upon a spike bearing three to four. The leaves are few and narrow. (Silver Banksian Medal for the group.)

Mr. H. B. May, Edmonton, had an extensive group of stove and greenhouse foliage plants and Ferns, tastefully arranged, and adding much to the appearance of the hall. (Silver-gilt Banksian Medal). Messrs. Kelway & Sons had a large number of *Gaillardias* in variety; Mrs. Pitcher, a crimson variety with yellow margin, was granted an Award of Merit. Jas. Kelway, is another very striking variety, with colour similar to the foregoing, and about 4 inches across. Tennyson is a very pretty yellow one. Also a beautiful collection of *Delphiniums*, of which the three following obtained Awards of Merit: Henry, a purplish-blue variety, with white eye—very large; Princess May, a charming variety—colour, a sort of heliotrope and pale blue intermixed; Sailor Prince, another purple variety, without any white. The same firm, whose exhibit brightened up all one side of the hall, had a number of hardy herbaceous cut flowers, including *Lychnis dioica* *alba fl.-pl.*, *Potentilla* (Hamlet), *Centranthus rubra*, *Eryngium giganteum* and *amethystinum*, *Galega compacta*, &c. (Silver-gilt Flora Medal.)

Mr. C. W. Consins, High Street, Wood Green, had a large number of cut blooms of *Gladiolus Colvillei* *alba*.

Messrs. Laxton Bros., Bedford, sent some hybrid Sweet Peas.

From the Royal Gardens, Kew, came a very interesting and valuable collection of cut Roses, embracing some scores of species and garden varieties, which were intended to show what could be done, even so close to London as Kew is; and the results were certainly satisfactory. Amongst a great many, were *R. rugosa* and its varieties, *R. nitida*, *R. arvensis fl.-pl.*, *R. gallica* var., *R. centifolia*, *R. indica sanguinea*, *R. hibernica*, *Rosa Mundi*, the streaked or mottled species; *R. polyantha* in variety, and a large number of garden hybrids, to which we may revert on another occasion.

Messrs. Paul & Son, Waltham Cross, exhibited some new Roses (Tea and H.P.). Clio, their new Tea of this season, received an Award of Merit. Its petals are very good, and the bloom pale pink.

Messrs. H. Cannell & Son showed some trusses of hybrid Verbenas. The varieties were named, but so keenly did they vie with each other that it would be needless to reproduce them here. (Bronze Banksian Medal; also an Award for *Petunia Schwester Bonifacia*.)

Messrs. J. Veitch & Son, had some cut blooms of *Lignstrum sinense floribundum*, *Cladrastis amurensis*, *Stuartia pseudo-Camellia*, *Ceanothus azureus*, and *C. alba*, *Andromeda speciosa cassinefolia*, a beautiful and most decorative plant; *Weigela* (*Diervilla*) *sessilifolia*, and *Notospartum Carmichaeli*. (A Silver Banksian Medal.) Also fifteen trusses of *Rhododendron javanicum*, *jasminiflorum* varieties; and two plants of *Gloxinias*, *Antigone* and *Herald*.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, Dr. Maxwell T. Masters, F.R.S.; the Rev. E. Handley, Sydney Courtauld, C. J. Lucas, A. H. Smee, E. Hill, James Douglas, H. Williams, T. W. Bond, H. M. Pollett, and T. B. Haywood.

Messrs. F. Sander & Co., St. Albans, exhibited a select group of Orchids, comprising many varieties of *Miltonia vexillaria*, of which one with a triangular rich maroon-crimson base to the labellum was pronounced to be the richest-coloured form yet exhibited (it was entered for a Certificate). Another distinct form was a pure white one, with lemon-yellow base to the lip, and without a shade of rose-colour in the whole flower. Other fine and distinct things

in Messrs. Sander's group were *Cattleya Batalinii*, a pretty variety, with slender stems, bearing from one to four flowers. The sepals and petals, which are nearly equal in width, are delicately veined and tinged with pale rosy-lilac. The front lobe of the labellum is rich violet-tinted crimson, the side lobes and column blush-white. It may be a natural hybrid with *C. Loddigesii*, but its slender growths are inexplicable. Another pretty novelty is *Oncidium Eoderianum* (natural hybrid, *crispum* × *curtum*?). The flowers, which are very showy, had the sepals yellow, barred with light brown, the nearly circular petals rich shining light brown, with a few golden-yellow marks at the edge; lip bright yellow, with a quarter-inch wide border of the same colour as the petals, and a narrow golden margin. In the same group were the rare scarlet *Renanthera matutina*, *Cypripedium Rothschildianum*, &c. A Silver Banksian Medal was awarded the exhibitor.

Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and Park Road, Clapham, staged a group of *Oncidiums*, mainly consisting of fine plants of *O. macranthum* and *O. curtum*. Among the former, *O. M. Williamsi*, which had a mottling of brown in the petals, was distinct. (A Silver Banksian Medal.)

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, showed another of their interesting hybrid Orchids, *Phalænopsis* × *Artemis*, for which an Award of Merit was made (*P. amabilis* ♀, *Bl.*, syn. *grandiflora*, Lindl., and of gardens, × *P. rosea* ♂), a most interesting cross, bearing some resemblance to *P. intermedia*, which has been proved by home-raised seedlings in Messrs. Veitch's nursery to be *P. Aphrodite* (*amabilis*, Lindl., and of gardens), × *P. rosea*. The flowers of *P. Artemis*, when the plant is strong, will be larger, and of a clearer pink than those of *P. intermedia*.

W. Vanner, Esq., Camden Wood, Chislehurst (gr., Mr. W. H. Robbins), showed a fine plant of the rare and beautiful white *Culogyne Sanderiana*, with three stout spikes, together bearing thirty blooms, receiving a Cultural Commendation. T. Gabriel, Esq., Streatham, also exhibited a smaller plant of the same species.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), showed the elegant little *Epidendrum Tampense*, collected by him in Florida. A Botanical Certificate was granted.

Major-Gen. C. S. Berkeley exhibited *Dendrobium crystallinum*, Gen. Berkeley's variety, one of the richest coloured forms of the species yet seen; and he received an Award of Merit.

J. W. Temple, Esq., Leyswood, Groombridge (gr., Mr. E. Bristow), sent *Cattleya Warszewiczii*, Temple's variety, and cut flowers of the same species; and of *C. Mendeli*, Leyswood variety, a very finely-shaped kind; also *C. granulosa Dubuyssoniana*, and a good form of *Cypripedium Philippinense*.

Messrs. Pitcher & Manda, The United States Nurseries, Hextable, Swanley, Kent, sent *Cypripedium Stonei candidum*, a distinct variety, in which the usual dark lines in the sepals are absent, the flowers being ivory-white, with a tinge of lilac on the lip, and a few rose-coloured markings on the petals. An award of Merit was made to the exhibitor for this plant.

Messrs. Hugh Low & Co., Clapton, staged a small group of Orchids, comprising *Cypripedium bellatulum*, *C. hirsutissimum*, *C. Volonteanum*, and the light-coloured *C. V. Lowii*; *Dendrobium crystallinum album*, *Cattleya Gaskelliana alba*, *Pescatorea cerina*, &c.

Mrs. Crawford, Gattons, Reigate (gr., Mr. Slogrove), sent a fine form of *Cattleya Warszewiczii* (*gigas*); and Messrs. Lewis & Co., Southgate, exhibited *Cypripedium* × (*Lowii* × *Lawrenceanum*), under the name of *C. Macfarlaneum*, but *C. Macfarlanei* is a name already given by Messrs. F. Sander & Co. to *C. calophyllum* × *C. Spicerianum*.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; Jno. Lee, R. D. Blackmore, H. Pearson, Harrison Weir, G. Taber, W. Warren, A. Dean, J. Willard, G. H. Sage, G. Wythes, F. Q. Lane, H. Balderson, Dr. Hogg, and J. B. Cheal.

From the Royal Gardens, Windsor, came half a dozen very fine Pine-apples, and a collection of wonderfully good Cherries of the most tempting description. The following are the names:—Bigarreau Monstreue, Belle d'Orleans, May Duke, Black Tartarian, Governor Wood, Frogmore Bigarreau, Knight's Early Black, Bigarreau Napoleon (perfect sample), Downton, Black Eagle, Florence, Early Bigarreau, Late Duke, and Adam's Crown. (Silver Medal.)

Mr. Gilman, gr. to the Earl of Shrewsbury, Ingestre Hall, Stafford, sent half a dozen Melons, obtained from Hero of Lockinge × Beat of Ali. The fruit (*Ingestre Hybrid*) were yellow, and large. Melons also came from Mr. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, results of crossing many of the best varieties, with a variety called Syon House. A vote of thanks was accorded.

Some excellent new varieties of Strawberries of his own raising were shown by Mr. Allen, gr. to Lord Suffield, Gunton Park, Norwich. All of these varieties had been exhibited previously this year as forced fruits, or last year from the open ground. Lord Suffield is a mid-season fruit longish, cone-shaped, broad at the shoulder, and of a dark crimson colour. It bears in long succession, and the flavour is that of an improved Keen's Seedling. Empress of India is another cone-shaped variety of fair size and bright scarlet colour, with a strong smack of Queen flavour; it is an early fruiter, and packs well. Gunton Park is an immense wedge-shaped fruit, a great bearer, crimson in colour, with good flavour. It is a strong grower, and bears in long succession.

An interesting collection of Marrows came from the Royal Horticultural Society's Garden at Chiswick, both Custard and long-shaped varieties. Also some Apples, such as Manx Codling, Stirling Castle, Tom Putt, Gloria Mundi, Beauty of Kent, New Hawthornden, &c. Some fruits of a Fig (*Trifer*), came from the same source. A dozen Pines (*Queen*), of excellent quality, came from Mr. J. Fitt, The Gardens, Panshanger, Hertford (Silver Medal); also a good cluster of Bananas "Ladies Finger."

Mr. Thos. Bones, Chiswick, sent some heads of Cauliflower (*Acquisition*). Mr. C. Leach, Albury Park Gardens, Guildford, some Carrots, which had been grown with Leach's gnat and fly annihilator, with very good result. Also a few roots of Beet Leach's Telegraph, with the note that it can be had good for table every day in the year.

For Mr. Sharpe's prize for the three best dishes of Peas, 1, Sharpe's Triumph; 2, Sharpe's Queen; 3, Sharpe's Sir F. A. Millbank; Mr. C. Osman, Sutton, Surrey, was 1st; 2nd, F. S. Pridden, Esq., Boxgrove, Guildford (gr., Mr. F. Walker); 3rd, the Rev. L. R. Flood, Merrow Rectory, Guildford (gr., Mr. J. Gilbert).

Messrs. J. Veitch & Son, Chelsea, sent plants and fruits of a small Bean (*Multum in Parvo*). It is a dwarf-growing Bean, with small pods, and the seeds are only the size of Peas, but are very full, and possess mild flavour.

Mr. Crasp, gr. to Lord Wimborne, Canford Manor, Wimborne, sent a dozen Peaches (*Raymaker*). They were large, but of very poor colour. (Vote of Thanks.)

Mr. E. Manel, Caen Calvados, France, had specimens of his Mastic horticole Oger, a kind of grafting wax. (Vote of Thanks.)

LECTURE ON COOL ORCHIDS, by the Rev. E. HANDLEY.

The speaker commenced by saying that there was an impression abroad that an Orchid grower was necessarily an enthusiast who was prepared to spend fabulously sums upon plants, and that when obtained they are most difficult and expensive in regard to their wants and requirements. He should endeavour to show that such was not the case, but that some of the Orchids could be grown as cheaply and as successfully as other plants. The idea that they were only to be obtained at prohibitory prices had been formed by reading in the papers of the large sums occasionally paid for unique species or varieties, and when he had sought to explain this, he had been told that if they could not have the best of them, then they would have none. He ventured to think that this was very unwise, and it was a policy that they did not carry out in regard to other things. All the species Mr. Handley was going to speak of could be bought for a few shillings each, and they were beautiful subjects that could not fail to please. The Orchid grower need not be a collector of curiosities, neither need he seek to possess varieties that other people had not got, and for which, therefore, he would have to pay highly. Mr. Handley's next point was that there are Orchids which are not expensive to grow. The structure he would prefer for the growth of cool Orchids would be a lean-to, with north or north-westerly aspect. This should be about 12 feet wide, and as long as necessary; the height at the back 11 feet. The front glass should be about 18 inches high, and without any ventilators, but shutters let into the brick wall near the ground would be

best for that purpose. The top-ventilators should be about 2 feet wide, and run the whole length of the house. It was necessary to have some hot-water pipes to protect against very severe frost, and sufficient should be obtained that will keep the required temperature without being heated more than one can bear one's hand upon, as hot pipes cause a dry atmosphere. The temperature in winter should not be less than 36°, and certainly not higher than 45° to 50°. In summer it would be difficult to keep them cool enough. Blinds would be indispensable. These should be fastened to rollers, which should run on iron rods about 9 inches from the glass, which would allow a current of air to pass between. On the paths, &c., there must be no ornamental tiles, which reflect heat, causing a warm dry atmosphere. The speaker found that breeze, or small coke, was very suitable for paths, with a wooden trellis running along for walking upon. Such a path could easily be kept cool and moist. Good large tanks that would preserve plenty of soft-water should be in every Orchard-house. The front stage should be on a level with the bottom of the light, and that at the back a little higher. These should be covered with small shell or shingle, a couple of inches or less deep. The lecturer then said that the next point was what and how to buy. The cheapest and most interesting way was, to buy unflowered pieces. To a limited extent, and in an innocent manner, it allowed one to indulge in one of the vices of the nineteenth century, viz., speculation. From his experience, he found that in any collection from a reliable importer, or from the auction rooms, there were always some treasures. Mr. Handley then gave the names of some of the species that were amenable to the "cool" treatment, amongst which were included the following:—*Odontoglossum crispum*, *O. blandum*, *O. caudatum*, *O. cirrhosum*, *O. Hendersonianum*, *O. nebulosum*, *O. Pescatorei*, *O. triumphans*, &c. *Oncidium concolor*, *excavatum*, *Forbesii*, *macranthum*, *tigrinum*, &c. *Masdevallia coccinea*, *Haryana*, *Lindenii*, *igneae*, *Shuttleworthii*, *Wallichii*, &c.; *Sophranitis grandiflora*, *Lælia Dayana*, *Nanodes Medusa*, *Maxillaria grandiflora*, &c.; *Cypripedium insigne*, *Boxalli*, and *villosum*; *Pilumna fragrans*, and *Epidendrum vitellinum majus*, although the lecturer himself had not had very satisfactory experience with the last-named. Mr. Handley then gave directions for the staging of the plants, and advised that those requiring little head-room should be stood upon the front stage, and the rest on the stage at the back of the house, keeping the coolest and dampest spot available for the *Masdevallias*. From their pendulous habit, some of the species would be especially suitable for hanging-baskets, such as *Odontoglossum Cervantesii*, *O. Rossi*, and its varieties, the bright little *Sophranitis grandiflora*, &c. After speaking encouragingly respecting the peculiar treatment required by many of the plants, and advising that they be moved about until the proper place be found, the reverend gentleman said that there were three points essential to their proper culture, viz., (1) the proper temperature in each season of the year; (2) proper and judicious watering; and (3) perfect cleanliness, including plenty of pure air. To provide against three pests that the inmates of this house are liable to, the lecturer advised that for thrip, the plants should be periodically looked over, especially the young growths, and with the aid of a camel's hair brush, and some insecticide, they could be kept free from these minute insects. If green-fly appeared, then fumigate with pure tobacco. Slugs must be trapped by some such means as a piece of Turnip or Potato, &c., and a little cotton wool wrapped round the foot of a spike would prevent them reaching the flowers. Some plants, such as *Oncidium concolor*, should be allowed, every alternate year, to recoup themselves, as they are likely to suffer from undue floriferousness, and no spikes should be allowed to remain on the plants until they wither. In conclusion, Mr. Handley said Orchids no doubt required attention, observation, and study, but that study would be interesting, and would lead to the study of geography, that we might understand the natural homes of the plants; chemistry, to assist us to understand the food supplies required; and botany, that we might know to what family each plant belonged. No hobby was worth the name if it did not cause its pursuer a little trouble, and success would lose its sweetness if it were not for the difficulties overcome.

The Chairman, Mr. J. Douglas, emphasised the injury resulting from front ventilators close to the

plants, which allowed the warm air in summer to blow directly upon them, and said the Orchid grower required but patience, perseverance, and a thorough love for the plants.

CLIFTON AND BRISTOL ZOOLOGICAL.

JUNE 29, 30.—During the past few years this Society has relinquished the holding of a horticultural show, because the takings did not pay the expenses. The shows have, however, been reconstituted, under the spirited management of Mr. Collier, the Society's superintendent, assisted by Mr. Harris, who ably presides over the horticultural department of the Clifton Zoological Gardens. The fine weather which prevailed during the two days the show remained open, and the attraction of a Hungarian band, proved sufficient, it may be hoped, to make the exhibition a success from a pecuniary point, as it certainly was from every other.

Roses.—These flowers were well shown, although but few nurserymen put in an appearance. For forty-eight distinct varieties, single trusses—nurserymen, G. Cooling & Son, Bath, were 1st, having Alfred Colomb, Pride of Waltham, A. K. Williams, Madame G. Luizet, Mlle. S. Rodocanachi, and others in fine condition; 2nd, Mr. Mattock, New Headington, Oxford. In the classes of twenty-four Roses, and twelve blooms, the same exhibitors were 1st and 2nd in the same order of their names. For eighteen Tea or Noisette, distinct, Mr. Mattock was 1st with an all-round good lot; *Souvenir d'un Ami*, Marie Van Houtte, Anna Olivier, Niphotos, Rubens, and Madame C. Kuster, being particularly well shown; Messrs. Cooling & Sons were a good 2nd.

Amateurs exhibited well in the ten classes devoted to them, and the competition was close. For twenty-four blooms, distinct, S. P. Budd, Esq., Bath, was 1st; A. Hill Gray, Esq., Bath, 2nd. For twelve Tea or Noisette, S. P. Budd, Esq., was again 1st, having *Souvenir d'Elise*, Madame Margottin, Rubens, and Edith Gifford, in fine condition. For twelve, any variety, A. H. Grey, Esq., Bath, was 1st, with Anna Olivier; 2nd, S. P. Budd, Esq., with A. K. Williams; 3rd, J. Lysight, Esq., with *Devoniensis*.

For a basket of Roses, arranged with Rose foliage, 1st, E. King, Esq., Clifton, with a light and tastefully-arranged basket; 2nd, the Hon. Frances Sugden, Wells; 3rd, E. T. Hill, Esq., Westbury.

The class for a bouquet of Roses was well filled, but most of the bouquets were much too closely arranged; those that won prizes were, however, good. Mr. J. B. Cole, Stoke Bishop, was 1st, Mr. J. B. Brain 2nd, and S. P. Budd, Esq., 3rd.

Plants.—The groups and other plants, which made a fine feature of the show, were arranged on the turf up the middle of each tent, and for one consisting of miscellaneous plants, Mr. Cypher, of Cheltenham, was awarded 1st prize, both good plants and good taste in arrangement being shown; 2nd, Mr. J. Saunders, Clifton, who arranged a very pretty group, containing Orchids, &c.

For six foliage plants, Mr. Cypher was 1st, with clean bright specimens of Palms, Crotons, Cordylines, &c.; H. St. Vincent Ames, Esq., who also had nice clean plants, being 2nd.

Mr. Cypher was again 1st in the class for six stove and greenhouse plants in flower, and contributed well-flowered fresh plants of *Stephanotis floribunda*, *Ixora Pilgrimii*, *Anthurium Scherzerianum*, *Erica ventricosa alba*, *E. jubata rubra*, and *Phenocoma prolifera Barnesii*. For a specimen stove or greenhouse plant in flower, Mr. Cypher was placed 1st with *Dracophyllum gracile*; 2nd, A. W. Summers, Esq., Clifton, with a well-flowered *Stephanotis*. For four Orchids, Mr. Cypher was 1st, with large well-flowered plants of *Cattleya Sanderiana*, *Angulon Clowesii*, *Dendrobium infundibulum*, and *Oncidium macranthum*. For six stove and greenhouse Ferns, an amateur, H. St. Vincent Ames, Esq., was 1st with excellent specimens of *Adiantum Farleyense*, *Microlepia hirta cristata*, *Gymnogramma chrysophylla*, and others; J. Lysight, Esq., 2nd, his best plants being *Adiantum gracillimum*, and *Davallia dissecta*.

Coleus, zonal *Pelargoniums*, *Petunias*, and similar soft-wooded plants were well shown, and gave effective colouring to the show. Cut flowers were likewise meritorious and well set up. For twelve bunches of cut flowers, W. R. Wait, Esq., was 1st; H. St. Vincent Ames, 2nd; J. W. Langdon, Esq., 3rd. Mr. Harris arranged a large group of seedling Ferns from the Society's grand collection, amongst which were numerous beautiful forms; Messrs. Garraway &

Co., nurserymen, Bristol, arranged a large and effective group of foliage and flowering plants; Messrs. Parker & Sons, nurserymen, Bristol, also contributed a large and bright group of ornamental foliage and flowering plants, and these non-competitive groups were much admired by the visitors.

Fruit.—There were only seven classes for fruit, and some of these were not filled. Black Hamburgh Grapes were large in bunch and berry, but there was none that was well-coloured. For three bunches, 1st, J. C. Wall, Esq., Redland Lodge; and 2nd, J. H. Cockley, Esq., Sneyde Park.

The Strawberries shown were of fine size, and the colour was good. For four dishes, 1st, Mr. G. Garraway, Bath, with Sir J. Paxton, Princess Alice, President, and Eleanor; 2nd, H. St. J. Vincent Ames, Esq., his best dish being A. F. Barron.

WINCHESTER HORTICULTURAL.

JUNE 30.—The Winchester Horticultural Society held its show as usual in the Guildhall, on the above date. Roses formed the prominent feature of the show, and the blooms were staged in creditable condition considering the unfavourable weather experienced in early spring, but in some classes the competition was weak, although good quality made up for the deficiency in this respect. The principal class, that for forty-eight varieties, distinct, and here Mr. B. R. Cant, Colchester, easily won with medium-sized, full and fresh blooms, especially good were those of Marie Baumann, Mrs. Paul, Alfred Colomb, and Madame Gabrielle Luizet.

In the class for twenty-four trebles, distinct, Mr. B. R. Cant was again successful with flowers of equal merit to those in the last class; Dr. Budd, Brooklyn Road, Larkhall, Bath, won 1st place in the classes for twenty-four single trusses, distinct, and for twelve trebles, staging very fine flowers of excellent colour and form; Messrs. Keynes, Williams & Co., Salisbury, won the 2nd prize in each of these classes. They also won for twelve trebles, Teas or Noisette varieties.

With the H.P. Gustave Piganeau, a rose of a rich colour, Mr. Cant was 1st for twelve blooms of any dark H.P., as he also won in similar classes for any one light variety, and one variety of Tea or Noisette Roses, showing Madame Gabrielle Luizet and Innocente Pirola; Dr. Budd and Messrs. Keynes were 2nd.

The following classes were open to amateurs only. For twenty-four single trusses, distinct varieties, Mr. Neville, gr. to F. W. Flight, Esq., Twyford, Winchester, was 1st, with a very fine lot of blooms, and among them good blooms of Ulrich Brunner, Cleopatra, Countess of Oxford, Catherine Mermet, and The Bride; Dr. Budd followed Mr. Neville very closely; seven competed. Dr. Budd and Mr. Neville changed places in the class for twelve trebles. For twelve Teas or Noisettes, the entries numbered six, and here Mr. Neville easily won 1st honours with medium-sized fresh blooms; Dr. Budd was 2nd. For twelve single trusses, distinct, Dr. Seaton of Rutland Lodge, Bitterne, was 1st, with a very good stand.

Miscellaneous.—Groups of mixed plants were arranged at the sides of the hall, and made a bright display, Mr. Thomas Lowms, gr. to F. C. Birch, Esq., Clavelly, Winchester, winning in the leading class, as did Mr. Astridge, gr. to W. Barron Simmonds, Esq., Abbots Barton, in the smaller class.

Table plants and Begonias were creditably staged.

The classes confined to ladies for the best dressed stand of flowers, and the same of wild flowers, created much competition and interest, so good were the exhibits. In the former class, Miss Ladhaws, Shirley, Southampton, was 1st, with a pretty arrangement of flowers, &c.; closely followed by Miss A. Flight and Miss Nelly Owen, Basingstoke. In the latter class, Miss Flight was distinctly ahead.

Groups of plants "not for competition" added to the embellishment of the hall. Mr. E. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, and Messrs. E. Hillier and Jeffrey, nurserymen, Winchester, were the more conspicuous exhibitors of these. Mr. Ladhaws, Shirley, Southampton, staged a collection of hardy cut flowers which was much admired. The arrangements, excellent as usual, were under the superintendence of Mr. C. Shenton, the honorary secretary of the society.

THE GLOUCESTERSHIRE ROSE.

JULY 5.—This Society held their annual show on Tuesday, July 5, in the Corn Exchange. The day was not propitious, some heavy thunder showers falling in the morning, and a steady drizzle all the afternoon.

Not many nurserymen competed, and these all hailed from the west; but in all upwards of 200 entries were received.

The Tea and Noisette classes were admirably filled. The colouring in Comtesse Nadailac, A. Olivier, and Hon. E. Gifford, being exquisite, due perhaps to the ferruginous soil of the district. Hybrid perpetuals were also very good, as Madame Gabrielle Luizet, Mrs. John Laing, and one flower of Mrs. G. Paul attracted deserved attention. The Rev. F. R. Burnside had five entries, in all of which he took 1st honours.

The cottagers' exhibits were beyond the average, the twelve blooms in the 1st prize being equal to those staged by the amateurs. The Society is affiliated with the National Society, and, without doubt, in spite of the unfortunate weather, the annual show was a great success, and the Society is very fortunate in having such a fine hall for their show. *Correspondent.*

CROYDON HORTICULTURAL.

JULY 6.—The committee of this Society was very fortunate in securing cool, pleasant weather for the holding of their summer exhibition on the above date, and found a very delightful spot for the purpose in the park-like grounds attached to Buckwood House, near to East Croydon Railway Station. It was very fortunate, too, that Mr. Philip Crowley, of Waddon House, is a considerable contributor of plants as, but for his many fine ones, the tent devoted to plants would, indeed, have been poorly furnished. Somehow, it would seem that plant culture does not flourish about Croydon. Theo, again, the show owed in the cut flower classes almost everything to the Roses, which brought a superb lot of blooms, and considerable competition.

Plants.—Of these, the best nine in bloom were shown by Mr. King, gr. to P. Crowley, Esq., Croydon, who had a good Clerodendron Balfourianum, the pretty Dipladenia boliviensis, Anthurium carneum, Ferrierense, and Andreanum; Stephanotis floribunda, Dracophyllum gracile, Ixora Williamsii, &c. Mr. King also had the finest specimen in bloom, a finely-flowered Clerodendron Balfourianum. Mr. Elsley, gr. to Captain Wright, Croydon, was 2nd, with a moderate Anthurium Scherzerianum. This latter exhibitor showed six plants in flower. Mr. King also had the best nine foliage plants in four diverse Palms, large specimens; Crotons superbus and Johannis; Alocasia macrorhiza, finely coloured; Dracena Lindenii, and Asparagus plumosus. Mr. King was also the only exhibitor of six Ferns, very fine pieces of Davallia Mooreana and polyantha; also D. fijiensis and D. fijiensis plumosus, and Adiantum gracillimum and cardiocleana.

The best single specimen foliage plant was a very fine Palm-like Carludovica Drudei from Mr. King. The same exhibitor had the best six Dracenas, medium sized, but well coloured plants of Lindenii, Gladstonei, Regalis, superba, and Recurva; Mr. Scott, gr. to J. Aste, Esq., South Norwood, was 2nd.

The only half-dozen of Caladiums, a very fine lot, came from Mr. Simmonds, gr. to H. C. Mayhew, Esq., Norwood Hill—Mons. A. Hardy, Luddemanniane, and Paul Veronese were admirably coloured. Mr. King was the only exhibitor of Selaginellas in pans, having specially good masses of Wildenoia, Kraussiana aurea, apoda, casia, serpens, and Poulterii. Exotic Ferns in 6-inch pots were largely shown, giving good variety.

Table plants were very good, the best nine coming from Mr. Lane, gr. to E. H. Coles, Esq., Caterham. Fuchsias were fairly good. Mr. Simmonds had the best six, with medium-sized pyramids, well bloomed; and Mr. Claley the 2nd best bushy plants, too much supported by sticks. Begonias in the large class for nine plants were unusually good. For gardeners, Mr. Slater, gr. to Mrs. Hulse, Carshalton, had the best nine dwarf compact very free-blooming plants. Mr. Simmonds was 3rd. Gloxinias were below average quality, and finer strains are much needed at Croydon. Mr. Simmonds and Mr. Perrett, gr. to Miss Fuller, Dappas Hill, exhibited zonal Pelargoniums of moderate quality. The best six Coleuses came Mr. R. Haynes, gr. to Miss Freeman, South Norwood.

In the plant tent were very good groups of plants from Messrs. J. Laing & Sons, Forest Hill; J. Peed & Sons, Streatham; Mr. T. Butcher, South Norwood; Mr. J. R. Box, Croydon, who had, in addition, numerous good Begonias and Caladiums; and Mr. A. Chaff, Parke Hill Nursery, Croydon. There were

but two large competitive groups, the best set up by Mr. Smith, gr. to G. Taylor, Esq., Margery Hall, Reigate; Mr. Scott was 2nd.

Roses.—The display made with these flowers proved to be exceedingly attractive. In the trade classes the Colchester growers had it all their own way pretty well. Mr. F. Cant was 1st with a fine lot of blooms in the class for forty-eight singles, having very good Duke of Teck, E. Y. Teas, Merveille de Lyon, Niphetos, Charles Lefebvre, May Bennett, &c. Mr. B. R. Cant, was 2nd; Messrs. D. Prior & Sons, 3rd. With twenty-four trebles, Mr. B. R. Cant was 1st, and had in his lot rich blooms of Maréchal Niel, La France, Earl of Dufferin, Marie Baumann, Madame Gabrielle Luizet, Mrs. J. Laing, and others; Mr. F. Cant was 2nd; Messrs. Prior & Son, 3rd. With twenty-four single blooms, Mr. W. Taylor, Hampton, was 1st, the blooms fresh but smallish; Mr. Rumsey, Wrotham, Kent, was 2nd; and Mr. T. Butcher, Norwood, 3rd. A very good twenty-four was disqualified because blooms of Comtesse Dechoisnel and Camille Bernardin were pronounced the same. Messrs. Prior & Sons had the best eighteen Tea and Noisette Roses, a capital lot of blooms; Mr. F. Cant coming 2nd; and Mr. B. R. Cant, 3rd. Messrs. Prior & Sons had the best twelve Teas of one variety in beautiful blooms of Marie van Houtte; Mr. B. R. Cant being 2nd with Madame de Watteville; Madame Cusin from Mr. Rumsey being 3rd. The best hybrid perpetual, one variety, was Horace Vernet from Messrs. Prior & Sons; Gustave Pigeaneu being 2nd, and Marie Baumann, 3rd. Mr. Rumsey had a box of bunches of Tea Roses, L'Idéale, reddish salmon, very lovely in the bud.

The Amateur's Classes.—These were well filled. Mr. Brown, gr. to Mrs. Waterlow, Great Doods, Reigate, took the Challenge Vase for the present year with forty-six good blooms; Mr. C. J. Salter, gr. to T. B. Haywood, Esq., Reigate, coming 2nd; and Mr. Meane, gr. to A. Tate, Esq., Woodside, Leatherhead, was 3rd. With twenty-four blooms, Mr. E. M. Bethune, Deune Park, Horsham was 1st; Mr. P. G. Burnand, Reigate, coming 2nd; and Mr. W. Blundell, gr. to C. Cristy, Esq., Westerham was 3rd.

With twelve Roses, one variety, Mr. Tucker, Swanley Junction, was an easy 1st, as he had superb blooms of Her Majesty, one of his box being placed as the premier flower in the amateur class; Mr. Brown was 2nd, with the same variety.

Mr. Bethune had the best eighteen Tea Roses; and Mr. Brown the best dozen.

Table Decorations were very attractive, several large tables being dressed very much after what are now regarded as the fashionable taste. One having three ordinary glass pergoes was placed 1st, and one having wire arches gaudily dressed with Shirley and Iceland Poppies was 2nd. Mr. Butcher had one table, not in competition, dressed with very lofty narrow arches, thinly covered with rich-coloured Poppies, which could hardly be termed pleasing. Mr. Chaff showed a very handsome basket of Roses, wreaths, bouquets, and ladies' wreaths or sprays.

Fruit was moderate in quantity and quality. Mr. J. Slater had the best six dishes of black and white Grapes, Anisden June Peaches, Bigarreau Cherries, President Strawberries, and a small Melon; Mr. Smith was placed 2nd.

There were no black Grapes, but some fair white ones, the best three bunches (Buckland Sweetwater) coming from Mr. Dangerfield, gr. to A. Steer, Esq., Norwood.

Mr. J. Slater had the best fifty Strawberries, in Sir Joseph Paxton, Sutton's A 1 Melon was the best, and Telegraph the best brace of Cucumbers.

Mr. J. Slater had the best basket of vegetables, in nine varieties; and Mr. Perrett the best basket of salading.

Cottagers' vegetables were very good and plentiful. Mr. R. Goaring, South Wimbledon, exhibited his metal plant suspender, for sustaining plants in pots in houses corridors, &c., and which seems to be a very useful article.

LEE, BLACKHEATH, AND LEWISHAM HORTICULTURAL.

JULY 7, 8.—This Society held its twenty-fifth annual exhibition on these dates. Favourable weather upon both days, and a larger show than has been seen there, we think, at all, resulted in a thorough success. There were seventy-two entries over and above the number that exhibited last year, and the general excellence of the exhibits in the plants and fruits superior to those seen on former occasions. Usually Gloxinias are quite a specialty here, but although there were

some very fair specimens to be seen last week, they were not quite up to the standard generally seen at Lee. To commemorate the twenty-fifth annual exhibition, a Silver Medal was offered to nurserymen only, for the best and most tastefully arranged group not less than 60 superficial feet, and Messrs. Peed & Son, Roupell Park Nurseries, Norwood Road, S.E., were the winners of the same, with a well-arranged group of miscellaneous stove and greenhouse plants, but unfortunately there was little competition in this class.

For six plants of ornamental foliage, the 1st prize was awarded to W. Strang, Esq., Lee Terrace (gr., J. Mullins), for a very creditable collection; H. W. Segelcke, Esq., was 2nd.

Caladiums were perhaps shown better than anything else in the whole of the exhibits, and J. Soames, Esq., J.P., Maze Hill, Greenwich (gr., C. Nunn), was 1st, for a group of six, with very first-rate stuff, the plants being some 4 feet through. This exhibit also obtained the Silver Medal offered by the *Gardeners' Magazine*, for the exhibit showing the highest cultural skill. Mrs. Penn, The Cedars, gr., F. Fox, was 2nd with another very creditable collection. For four Caladiums (nurserymen excluded), C. D. Abel, Esq., Eastcombe Villa, Blackheath (gr., W. Payne), showed very well, and secured 1st position.

Twelve stove or greenhouse plants.—These were well shown, and Mrs. Crundell, The Moat, Eltham, was 1st, with an interesting and meritorious collection, and likewise for twenty-four miscellaneous plants.

The best Gloxinias were shown by J. Soames, Esq., who with a plant of Kentia Fosteriana, was 1st for a single Palm, and in the competition for a group of plants arranged for effect, occupied a similar position, as well as in the class for four stove or greenhouse plants, in flower, other than Orchids, with Clerodendron Thomsonianum, Kalosanthes coccinea, Hydrangea hortensis, and a fairly well-flowered Azalea indica. H. W. Segelcke, Esq., was 1st for four distinct exotic Ferns, and for six Dracenas, with D. amabilis, D. Ferrierensis, D. Baptisti, and D. Lindenii, the latter, however, having but little colour. Mrs. South, Morden Road, Blackheath, was 1st for four ornamental Begonias, with some varieties of B. Rex.

Roses.—The best Roses were exhibited by C. E. Shea, Esq., Foots Cray, Kent, who was 1st for twenty-four single specimens, and for twelve single specimens, also for six Roses, H.P.'s, any variety, with Madame Gabrielle Luizet.

Pelargoniums.—Mrs. Crundell, The Mount, Eltham, was 1st for six show Pelargoniums, and for the zonals also, with very good stuff, especially in the latter class. J. Murray Wilson, Esq., Lee Terrace (gr., C. Saville), was 1st for six hardy Ferns, very nice clean plants, but showing evidence that they had just been brought from under glass.

Fruit, although in greater quantity than last year, was not of extra merit. W. G. Dawson, Esq., Plumstead Common (gr., L. A. Hester), was 1st for a miscellaneous collection of not less than four varieties. J. Vavasseur, Esq., was 1st for three bunches of black Grapes, with very fair black Hamburgh; and also for white Grapes, with fair Duke of Buccleugh.

Vegetables were better represented, and in most of the classes there were keen competition. For a collection of vegetables and salad, Mrs. Penn, The Cedars, was 1st; and for a collection of eight dishes of vegetables, J. Neighbour, Esq., Bickley Park, was 1st. The same position in the collection of six dishes being filled by J. Wainwright, Esq., Belmont Hill, Lee (gr., J. Pearce). The 1st prize for a collection of vegetables shown by a cottager, was gained very creditably by Mr. Court, Knowles Hill Crescent, Lewisham. Potatoes looked good, but were rather small; Mr. J. Neighbour's Ashleaf was the best kidney, and his Eight Week's the best round Potato.

MISCELLANEOUS.

Besides those we have enumerated, there were others in the plant, cut flower, fruit, and vegetable groups, including classes for ladies, for children, and for cottagers. Also many special prizes, offered by nurserymen and others for specific exhibits.

Amongst the non-competitive displays, we must mention a very fine group of single Begonias (tuberous) from Mr. H. J. Jones, Ryecroft Nursery, Lewisham, who had staged them very tastefully with pots of Maidenhair Fern. The same exhibitor almost filled one side of one of the tents with a magnificent display of Geraniums, Ivy-leaved, zonal, and show varieties. Messrs. Laing & Son, Forest Hill, had a pretty group of miscellaneous plants, also

a collection of cut flowers, hardy perennial Roses, &c. Messrs. Carter & Co., High Holborn, had a collection composed of small specimens of succulent plants, interesting and rare, and Mr. W. Curton, floral decorator, Blackheath, had wreaths, crosses, sprays, baskets of flowers, &c., which looked very delicate and inviting at the entrance to one of the tents.

REIGATE ROSE SHOW.

JULY 9.—The annual show took place in the beautiful grounds of Woodhatch Lodge, the residence of T. B. Haywood, Esq., whose able gardener, Mr. C. J. Salter, has the plant in perfect trim. The show was an excellent one, fine quality of bloom being the distinguishing feature throughout. We append a few notes of the principal exhibits. For forty-eight blooms, 1st prize, Mr. Frank Cant, Colchester; very noteworthy were Suzanne-Marie Rodocanachi, Comtesse de Nadailiac, Innocente Pirola, and François Levet. 2nd, Mr. B. R. Cant, Colchester, with a beautiful lot; Niphetos and Charles Lefebvre were very good in this stand. 3rd, Messrs. Paul & Son, Cheshunt, a bright and fresh collection. For eighteen Teas, 1st, Mr. Frank Cant, a very close 2nd being Mr. George Prince, Oxford.

For twenty-four blooms, amateurs, 1st, Mr. C. J. Salter, gr. to T. B. Haywood, Esq., who had some remarkably fine flowers of A. K. Williams and Alfred Colomb; 2nd, Rev. J. H. Pemberton; 3rd, Mr. Brown, gr. to Mrs. Waterlow. In the amateurs' division for eighteen blooms, 1st, E. B. Lindsell, Esq., a very fine stand, containing splendid flowers of Marie Baumann, Gustave Piganeau, Abel Carrière, Dupuy Jamain, and Earl of Dufferin; 2nd, Mr. S. P. Budd; 3rd, Mr. A. Tate.

For twelve blooms, 1st, Rev. H. A. Berners; 2nd, Mr. J. G. Fowler; 3rd, Mr. O. G. Orpen. For nine Teas, 1st, Mr. O. G. Orpen; 2nd, Rev. H. A. Berners; 3rd, Mr. Percy Burnand. For six Teas, 1st, Mr. W. A. Freshfield; 2nd, Mr. M. Hodgson; 3rd, Mr. J. de la Marle. For twelve Teas, 1st, E. B. Lindsell, Esq.; 2nd, Mr. S. P. Budd; 3rd, Mr. T. W. Girdlestone. For four vars., three trusses each, 1st, Rev. H. A. Berners; 2nd, Mr. C. E. Cuthell; 3rd, Mr. E. Mawley. For nine blooms of any variety, 1st, Mr. Percy Burnand (Marie Van Houtte); 2nd, Mr. C. E. Cuthell, with the same variety; 3rd, Rev. H. A. Berners (Eclair). For two of any variety, 1st, Mr. E. B. Lindsell (Caroline Kuster); 2nd, Mr. E. M. Bethune (Madame G. Luizet); 3rd, Mr. A. Slaughter (Alfred Colomb).

Garden Roses, shown in bunches, constituted a really delightful feature, the principal prize-winners being Messrs. T. W. Girdlestone and Mr. A. Tate. Polyantha Roses were well staged by Messrs. Tate and Cuthell.

The table decorations of Miss E. S. Watney and Miss B. Lorent were in beautiful taste. Amongst subjects not for competition may be mentioned a nice group of flowering and foliage plants from Messrs. Peed & Sons, Roupell Park Nurseries, an attractive display of hardy flowers in variety; and cut Roses from Messrs. J. Cheal & Sons, Crawley; a charming box of Rose l'Idéal, from Mr. S. G. Rumsey, Wrotham, Kent, who had a number of other varieties; cut Roses in variety from Mr. Will Taylor, Hampton; and some wonderfully fine blooms of Rose Her Majesty, from Mr. Brown, gr. to Mrs. Waterlow.

It is very necessary that the exhibitors' addresses should be given on the cards for the information of press representatives and the general public, omissions of which were very frequent at this exhibition. We refer more particularly to the amateurs' exhibits, as the trade may be always expected to have matters right in this direction.

EALING HORTICULTURAL.

JULY 13.—The twenty-eighth annual summer exhibition of this prosperous suburban Society took place in the grounds of Gunnersbury Park, by the kind permission of the Messrs. de Rothschild on this date.

The show compared favourably with its predecessors, the details incidental to such an exhibition being most satisfactorily carried out by the indefatigable secretaries, Messrs. Cannon and Dawes.

Groups of plants arranged for effect.—1st, with a remarkably pretty arrangement, Mr. Denison, gr. to T. A. Gledstanes, Esq., Manor House; 2nd, Mr. Roberts, gr. to J. Harris, Esq.

Six fine foliage plants.—Here again Mr. Denison led, with well grown examples.

Four flowering plants.—Honours in this class were well taken by Mr. Loug.

Some magnificently-flowered specimens of Gloxinias gained the premier position for Mr. J. Beesley, gr. to A. Fraser, Esq.

Twelve bunches of Gloxinias, wonderfully fine flowers, gained 1st place for Mr. T. Shingle, gr. to M. Hulbert, Esq.

Fuchsias were a nice feature, the principal exhibitors being Mr. C. Long, and Mr. A. Jones, gr. to E. Hyde, Esq.

Cut Roses formed a good display, the premier prizes in the trade being secured by Messrs. Paul & Son, Cheshunt, and Mr. C. Turner, Slough.

Mr. George Cannon, manager to Messrs. C. Lee & Son, Ealing, staged (not for competition) a beautiful collection of Rose blooms, representing all the best varieties. The hardy herbaceous plants from Messrs. Lee were also very noteworthy; Messrs. Veitch & Sons, Chelsea, also contributing, not for competition, a charming display.

The Gold Medal of the National Rose Society for eighteen Roses was well taken by Mr. C. Long, and this is the third time he has accomplished this feat; 2nd, Mr. N. Pouting; 3rd, Mr. A. Jones, gr. to E. Hyde, Esq.

Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, staged a bank of flowering and foliage plants, not for competition, in which section Mr. J. Hudson, Gunnersbury House, made quite a new and most effective departure in group exhibiting, by staging a group arranged in a square, and to which we intend to refer on a future occasion. The non-competitive group of Carnations, consisting of finely-flowered plants from Mr. Reynolds, gr., Gunnersbury Park, formed quite a noteworthy feature of the show.

Mr. Cooper, gr. to E. M. Nelson, Esq., staged a pretty group of foliage and flowering plants.

Much interest centred in the class for a collection of vegetables, the 1st prize for which, a Silver Watch offered by Mr. A. Pooley, was, in a keen competition, awarded to Mr. Goldsworthy, 12, Bayham Road; 2nd, Mr. Harman, 8, St. Helen's Road. The cottagers' exhibits of vegetables were worthy of all praise.

SCOTLAND.

CUCUMBER DISEASE IN THE NORTH.

THERE are several diseases which attack Melons, Cucumbers, and Vegetable Marrows. These vexatious maladies were, to practical gardeners, something like a calamity about thirty years ago, and appeared to be most common where the cultivation of Melons had for years been a leading feature in the establishment. It was combated with in earnest by many of the leading cultivators without any apparent satisfactory results. I refer at present to that disease which causes curling up of foliage and young growths; the other two known to me were the sudden death of a whole plant or part of one, and the always common disease known as canker. The first evil indicated above appears to be a fungus, and does not remain alone with the Cucumber family, but extends its destructive powers to Capsicums, Tomatos, French Beans, Celosias, and a few other plants we have associated with Melons grown on shelves in Pine-houses. I notice that Cucumbers (the young shoots of which died off when a few inches long), and most of the Melons suffered more or less, but one which is well-known for robust and hardy habit (Morris' Little Heath) has formed large green foliage, and produced fruit grown in pots 9 lb. and over, while Reid's Scarlet-flesh, our favourite Bleuheim Orange, La Favourite, and others have suffered much, but bearing nice fruit from 3 to 4 lb. The Little Heath is a good Melon when ripened, with abundance of large healthy foliage, liberal supplies of air, and not heavily watered at the roots, which is easily managed when grown in pots. Canker I never had on plants in pots. A small handful of charcoal pounded finely and put round the stem helps to ward off this disease, but gross stems and rich soil are productive of canker. The dying-off piecemeal, or all at once hurriedly, is the most perplexing disease of the three. Once, when I was employed in a London nursery (now extinct), this disease was quite masterful over every effort to assuage it, and put me much in mind of the disease which is so common with the Apricot. I have seen

in Suffolk whole beds of ridge Cucumbers cleared off with it, causing consternation among cottagers who grew Cucumbers to pay their house rent. We find Gishurst Compound, with sulphur added, to arrest the progress of the fungus disease. I notice it is very general in these parts (Stirlingshire) especially among Tomatos, Melons, and Cucumbers. *M. Temple.*

METHVEN'S INVERLEITH NURSERIES.

This firm has gigantic nurseries, but the Inverleith glass and grounds may be looked upon as an auxiliary nursery to the larger spaces covered with collections of trees, shrubs, and glass. Having half an hour to spare, I looked in on Mr. McKenzie (the enterprising manager at Inverleith Nursery), and found, as on former visits, the whole of the contents of the glass structures (except large Camellias, Azaleas, and other huge plants, kept for supplying cut flowers in winter and spring, were in the transition state, which means that the plants in flower, ready for sale or for decorative purposes, were being thinned out and re-arranged by adding succession stock, in order to take the place of their departed fellows. When visiting such nurseries, and there are many others around Edinburgh, one may pause and ask themselves the question, "Where can so many thousands of plants in pots be sent to?" It does not, of course, all go to country gardens, nor to the largest of suburban gardens, but the taste for foliage and flowering plants is largely on the increase among most of the middle, and even the working-classes, so that nursery growers must cater for the general public, as well as their aristocratic customers, far and near. It is not only flowering plants that have to be grown in immense numbers; but shrubs, dwarf in habit, or kept dwarf by cultivation, are grown by thousands. At Inverleith, the quantities of Retinosporas (especially *R. plumosa aurea*), Aucubas, Cupressus, Follies (especially variegated ones), and many other species, indicate that the taste for substantial and permanent plants is increasing, and ordinary bedding-plants do not monopolise space in gardens to the extent they once did. Roses, Carnations, and herbaceous plants, are among the specialties; English Iris, Gladiolus The Bride, and others of this class, are grown in great quantity to meet the growing demand for flowers in a cut state.

Passing by pits filled, or which were lately so, we enter long span-roofed houses filled with Callas, Cliveias, pyramid *Eleagnus variegatus*, Euryas (also hardy), Pelargoniums, semi-double especially being much valued for cutting; they seem to have had a new lease of life, as they are now often seen in great numbers in private places as well as in nurseries. Euonymus are being propagated in great numbers for winter use. Chrysanthemums, of course, are in great abundance, both for large and small flowers; long lines are planted out, for September cutting, in the open ground. The larger flowers are not valued so much for general decorative purposes, but are suitable for low glasses on tables, and are much in request for this purpose, whilst smaller flowers when grown in clusters of five or six, with a good stem, are most valued for room decoration.

Though the demand for flowers, cut and in pots, has greatly increased of late years, the means of supplying them have extended proportionately. The Messrs. Methven, like their compeers, have to make special efforts to keep pace with the times, and retain their position. Their wreath, spray, and bouquet-making is a trade in itself. *M. T.*

COLONIAL NOTES.

THE MANGOSTEEN, GARCINIA MANGOSTANA.

THE following article, which appeared in the November number (1891) of the *Trinidad Agricultural Record*, is from the pen of Mr. J. H. Hart, recording the successful transmission of Mangosteen fruits into England during the latter part of 1891. It occurred to me that it might be of some interest to readers of the *Gardeners' Chronicle*.

"The first number of the *Agricultural Record*, published in 1889, contained an account (extracted from the *Gardeners' Chronicle* of November, 1875) of the sending to England by my predecessor, Mr. Prestoe, of two Mangosteen fruits as a trial shipment, it being the first time on record that fruit of the tree had been produced in the western world, and the account states that they arrived in excellent order, and were much appreciated.

"The tree being in fruit in September last (1891), at the time Sir F. Napier Broome, K.C.M.G., was leaving for England, His Excellency expressed the wish to take some of the fruit with him, with the view of presenting it to the Queen, it being reported that the Mangosteen was almost the only fruit worth eating which Her Majesty had never tasted. I received instructions, therefore, to prepare a consignment for the purpose, and to give directions for the care of the fruit during the voyage. The care of the fruit was personally supervised by His Excellency, and with such success that the fruit reached London in excellent condition, and was forwarded at once to Her Majesty at Balmoral. The following will show that it was much appreciated by Her Majesty:—

"Buckingham Palace, October 12, 1891.

"DEAR SIR FREDERICK BROOME,

"The fruit has duly been received at Balmoral, and with your letter, has been given to the Queen.

"I am commanded by Her Majesty to thank you for these Mangosteens, and I may add that the Queen says at the same time 'they were quite excellent.'

"Yours sincerely, "HENRY F. PONSONBY."

"Can Trinidad claim the honour of being the first of the Queen's possessions to afford Her Majesty the opportunity of tasting what is often called 'the finest fruit in the world?'"

"The tree is a native of Singapore, and besides the specimen growing in the Royal Botanic Gardens, Trinidad, there is only one other fruiting tree known to exist in the Western Hemisphere, and that, a tree of much smaller size than ours, is growing in the Botanic Gardens, Castleton, Jamaica. The fruits were packed in a single layer, in a shallow box, in nests of cotton-wool. Instead of placing them in the ice-closet of the steamer, directions were given that they should be placed in an airy position in an empty cabin, with the lid and upper packing removed until cool weather was encountered. The upper packing was then to be replaced, and the lid screwed down, taking care to keep the box in a warm position as the weather became cooler, and when removed from the ship to be covered with a woollen rug or other covering.

"This was similar treatment to that which resulted in the safe transportation of the No. 11 Mango from Jamaica to England in 1879, and is one which I am confident could be adopted with other tropical fruits much more successfully than the usual course of placing them in the ice chamber of a steamer."

In a paper on "Tropical Fruits," written by Mr. D. Morris, M.A., F.L.S., published in the *Gardeners' Chronicle* for July 24, 1886, reference is there made to the Mangosteen having fruited both in Trinidad and Jamaica. Mr. Morris winds up his very interesting paper—"Hence West Indian Mangosteens and Durians are objects not impossible to be seen in England during the next decade." *W. E. Broadway, Royal Botanic Gardens, Trinidad.*

Obituary.

MR. WILLIAM TOOGOOD.—The death of this well-known member of the horticultural and agricultural seed trade, which took place at his residence, Southampton, on Thursday of last week, removes one who had made, both as a business man and a seedsman, an excellent reputation. There was perhaps some natural pride on the part of the deceased that the Royal patronage bestowed upon his business enabled him to advertise himself as "The Queen's Seedsman," although honours of that description in no sense outweigh the reputation of a wide character for business integrity and ability, which Mr. Toogood possessed in a high degree. A good many years since he was in the service of the once eminent nur-

ery and seed firm of Southampton, Messrs. W. B. Page & Sons. Then he became a partner in all that was finally left of the old business, that of the seed trade, with the late Mr. Bridgewater Page, and eventually became sole proprietor. With the well-known exception of the fine nurseries of Messrs. W. Rogers & Son at Red Lodge, Southampton now boasts of no other important nursery establishment, but has a very good seed trade especially of an agricultural kind. The late Mr. Toogood realising the importance of furnishing high class seed stocks to root growers, held every year in the town of Southampton a root exhibition, connecting with it also garden roots, of which good stocks for gardeners are not less important than are root stocks for farmers. Some few years ago Mr. Toogood's health suffered severely, but of late it materially improved. He was sixty-five at his death, and has left sons who now conduct the old and excellent business.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

A GARDENER wishes to know if there are any oil-lamp stoves invented capable of heating a house 36 by 12 feet with hot-water pipes; temperature required about 40° in winter. Position of house, where smoke is objectionable.

Mr. G. Sampson would be very grateful if any of our readers could tell him of any places where an "Allotments Association" is in existence on the co-operative plan.

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.

*	1	132	0	+	33	42	2	94	12.3	67	49

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending July 9, is furnished from the Meteorological Office:—

"The weather during this week was extremely unsettled, with frequent and rather heavy rain in the western and northern parts of the Kingdom; but in

the south and east the conditions were generally fair, although rain fell during the middle part of the period, and again at some stations towards its close.

"The temperature was rather above the mean in 'England E.' and the 'Channel Islands,' and just equal to it in 'England, S.,' in all other districts, however, there was a slight deficit. The highest of the maxima, which were recorded on the 3rd over England, and on irregular dates in Ireland and Scotland, ranged from 85° in 'England, E.' and 84° in the 'Midland Counties,' 81° in 'England, S.,' and 80° in 'England, S.W.,' to 68° in 'Ireland, N.,' 66° in 'Scotland, E.,' and 62° in 'Scotland, N. and W.' During the greater part of the period the daily maxima were below 70°. The lowest of the minima were recorded on very irregular dates, and varied from 40° in 'England, N.E.,' and 41° in the 'Midland Counties,' to 48° in 'England, S.W.,' and 52° in the 'Channel Islands.'

"The rainfall exceeded the mean in Ireland, Scotland, and the western and north-eastern parts of England; in the 'Midland Counties' and 'England, S. and E.,' however, it just equalled the normal, while in the 'Channel Islands' it was rather less. In Ireland and the north and west of Scotland, the excess was considerable.

"The bright sunshine continued fairly prevalent over the eastern and southern districts, but showed a decline in the north and west, where it was less than the normal. The percentage of the possible duration ranged from 67 in the 'Channel Islands,' and from between 48 and 53 in the east and south of England, to 29 in 'Ireland, N.,' 24 in 'Scotland, E.,' and to only 12 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, July 14.

TRADE slow, with heavy supplies. *James Webber, Wholesale Apple Market.*

POTATON.

NEW POTATON.—Kidneys, 5s. to 6s. 6d.; Rounds, 4s. 6d. to 5s. Market dull.

OLD POTATON.—Season virtually over. Best samples command 100s. to 120s. per ton. *J. B. Thomas.*

SEEDS.

LONDON: July 13.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that the seed market to-day was devoid alike of business and of interest. As regards new French Trifolium, buyers anticipating, either rightly or wrongly, lower prices, still hold aloof. Mustard and Rape seed keep firm. The re-shipment to America of Canadian blue Peas strengthens the English market. In Canary seed the tendency continues upwards. Hemp and Linseed are neglected. For Spring Tares there is still some sale. Haricot Beans, Bari, Buckwheat, and Millet realise former terms. The Board of Trade Returns give the imports into the United Kingdom of Clover and grass seeds for the first six months of this year as 178,831 cwts., value £400,569 as against 148,945 cwts., value £328,789, for the corresponding period of 1891.

FRUITS AND VEGETABLES.

BOROUGH: July 13.—Quotations:—Cauliflowers, 2s. 6d. to 3s. per dozen; Cabbages, 3s. to 5s. per tally; Peas, 2s. to 3s. 6d. per bushel; Greens, 1s. 6d.; new Carrots, 3s. 6d. to 4s.; Spring Onions, 3s. to 5s. per dozen bunches; Egyptian do., 3s. 6d. to 4s. 6d. per cwt.; English Apples, 3s. per bushel.

FARRINGTON: July 14.—Quotations:—Cabbages, 5s. to 6s. per tally; Carrots (crew), 5s. per dozen (large) bunches; do. small, 3s.; Turnips, 5s. per dozen large bunches; spring Onions, 4s. to 5s. per dozen bunches; Egyptian Onions, 5s. per cwt.; Peas, 5s. to 6s. per bag; Cucumbers, frame, 2s. 6d. per dozen; do., natural, 1s. 6d. to 2s. per dozen; foreign Tomatos, 9d. to 1s. 3d. per 8 lb. box; Cherries (white), 3s. to 5s. per half-sieve; do., black, 3s. 3d. to 7s. do.; Strawberries, 3s. to 4s. 6d. per peck; green Gooseberries, 3s. per half-sieve; red do., 3s. 6d. per half-bushel.

POTATOS.

BOROUGH, July 13.—Quotations:—St. Malo, 3s. 6d. to 4s. 6d.; Jerseys, 4s. 6d. to 5s. 6d.; Cherbourg, 4s. to 5s. per cwt.; English Early Rose, 70s. to 80s.; Hebrons, 80s. to 100s. Old: Bruce Magnums, 90s. to 100s. per ton.

FARRINGTON: July 14.—Quotations:—Magnums, 85s. to 100; Jersey, 90s. to 100s.; White Beauty, 4s. 6d. to 5s. per cwt.

GENERAL AVERAGE: July 13.—English Kidneys, 5s. to 6s. 6d.; Jersey, 4s. 6d. to 5s. 6d.; French, 3s. 6d. to 5s. per cwt. Old: Hebrons, 80s. to 100s.; Magnums, 90s. to 100s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 105s.; inferior, do., 40s. to 75s.; hay, best, 60s. to 98s.; inferior, do., 20s. to 50s.; and straw, 20s. to 38s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending July 9, and for the corresponding period last year:—1892: Wheat, 29s. 2d.; Barley, 24s. 4d.; Oats, 21s. 7d. 1891: Wheat, 38s. 7d.; Barley, 26s. 2d.; Oats, 20s. 11d.

NOTICES TO CORRESPONDENTS.

*. PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We have been pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilise them for the benefit of our readers.

BANANAS: J. D. S. Musa Cavendishi and M. Paradisiaca are the varieties grown in hothouses in this country. We doubt if they are grown commercially anywhere out of the tropics. The above species are fairly good, but a much finer-flavoured species is grown in British Guiana, the fruits of which have reached us in the dried state within the past year or two. The fruits are small, half the size of those of Musa Cavendishi, and in the dried state they bear transit admirably. The senders in George Town hope to create a trade in them in this and other temperate countries.

BEGONIA BAUMANNI: C. E. Since answering you in a previous number, a foreign correspondent has kindly furnished the required information. It is to be bought of Mr. Lemoine, at Nancy, for 4 francs each, or 12 for 28 francs.

BOOK ON IRRIGATION IN CALIFORNIA: C. H. R. An enquiry of Messrs. Williams & Norgate, foreign booksellers, might be of value in eliciting an answer. We know of none.

CLEMATIS: Bloomfield. Send the flowers to some one who has a good collection of these plants.

CORRECTION: Show at Earl's Court. Messrs. E. Shuttleworth and Co.'s exhibit, see *Gardeners' Chronicle*, July 9, p. 50, col. a; for "Silver Medal," read "Gold Medal."

CUCUMBERS DISEASED: F. Hall. The fruits are attacked by a fungus, and you must clear out the soil and the plants. Wash the glass with arsenical water, 1 oz. to the gallon, washing this mixture off with clean water before it is dry; and limewash the walls. The spores of the fungus may be in the soil you have been using, and it will be advisable to procure soil, &c., from another source. The close, humid warmth of the ordinary cucumber pit is particularly favourable for the development of fungous growth.

FILBERTS: C. E. M. An excellent crop.

INSECT ON POTATOS: C. H. Perkins. An aphid.

NAMES OF PLANTS: John Hopper. Specimens dried up before we received them. So far as we can make out, they are—1, Anthyllis vulneraria; 2, Echium vulgare; 3, Trifolium arvenae; 4, Daucus carota; 5, some umbelliferous quite undistinguishable in its present state.—S. W. 1, Lychnis chalconica; 2, Veronica spicata; 3, Gnaphalium lanatum; 4, Geranium sanguineum; 5, Verbascum thapsus; 6, Lysimachia thyriflora; 7, Eschscholtzia californica; 9, Ferula sp.—O. O. Asclepias curassavica.—G. H. 1, Ginkgo biloba, the Maiden-hair tree; 2, Spiraea sp.; 3, Edwardsia microphylla; 4, specimen insufficient.—J. E. 1, (E)nothera Lamarckiana; 2, Geranium pratense; 3, Lysimachia clethroides; 4, Pyrethrum Parthenium; 5, Gnaphalium lanatum.—F. S. Cologynne speciosa. The material used is correct. Grow in warm house.—R. S. Orchis foliosa.—R. Y. A. All withered, and labels mostly gone astray. We believe them to be—1, Lotus corniculatus; 2, Achillea Millefolium; 3, Veronica sp.; 4, Stellaria graminea; 5, Centaurea nigra; 6, Prunella vulgaris.—S. B. Send when in flower.—G. S. Cologynne speciosa.

PEAS DESTROYED FROM ROOTS UPWARD: F. E. M. Something deleterious may have been applied to the land, as gas-lime, strong manure-water, &c. The roots are intact, but dead.

PELARGONIUM LEAVES: W. H. A peculiar thickening of the skin of the leaf; there may be fungus also. We will report later on.

REPORTS OF SHOWS: J. P. & Sons. We can have no animus against exhibitors, as it would be quite against our interests—of that you may be quite assured; but it is impossible, with the space at our command, for us to report everything at a large show, especially one of an unofficial character.

ROSE LEAF CURLED: G. D. We found a small caterpillar, which has probably caused the mischief.

ROSE SPORT: F. M.—Your sport is distinct and interesting, but there are so many Roses of a similar colour as good as yours, if not better, that we hardly think it would be worth your while to propagate it.

THE APPLICATION OF ARTIFICIAL MANURES, &c. H. W. J. P. M. The pamphlet may be had of H. & E. Albert, 17, Gracechurch Street, E.C.

TOMATO DISEASED: Constant Reader. The fruits are attacked by Cladosporium lycopersici, for description and figure of which, see *Gardeners' Chronicle*, October 1, 1887.

TOMATO LEAVES: H. H. Badly affected with the Tomato fungus. Cut off all the affected leaves, and burn them. We fear it has gone too far for any application to do good.

The GREATEST NOVELTY of the AGE!

SAM DEARDS' PATENT SELF-WATERING SHELF FOR PLANTS ON SHELVES.

Now on view at Stand 11, Block A, Horticultural Exhibition, Earl's Court, S.W.

ITS ADVANTAGES ARE—

- 1st.—No waste of water, all water being absorbed by the plants.
- 2nd.—Saving of three-fourths of the labour in watering.
- 3rd.—The plants are watered more naturally than by any other method.
- 4th.—All drip and water dropping from shelves to plants beneath entirely prevented.
- 5th.—Not a drop of manure-water is lost, all being absorbed by the plants.
- 6th.—A boy can do the work of a man.
- 7th.—A row of plants 100 yards long can be watered without walking a yard to do it.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD," ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other Property advertised in the Columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let would do well to advertise in the "WORCESTER HERALD," the Leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

TO NURSERYMEN and FLORISTS.—Young man seeks situation; experienced in all branches of the trade; is of good address; thorough knowledge of Wreath, Bouquet, and Decorative Trade.—M., 33, Victoria Road, Bournemouth.

TO NURSERYMEN and FLORISTS.—Situation wanted by a young man, quick at Making-up Wreaths, &c., and willing to fill up time under Glass; good experience and references.—H. JUPP, Hadlow Road Nursery, Tonbridge, Kent.

HOLLOWAY'S PILLS.—The Hour of Danger.—Disease commonly comes on with slight symptoms, which, when neglected, increase in extent, and gradually grow dangerous—a condition which betrays the grossest remissness—when these Pills, taken in accordance with their accompanying directions, would not only have checked, but conquered the incipient disorder. Patients daily forward details of the most remarkable and instructive cases, in which timely attention to Holloway's advice has undoubtedly saved them from severe illness. These Pills act primarily on the digestive organs, which they stimulate when slow and imperfect; and, secondly, upon the blood, which is thoroughly purified by them, whence is derived the general tone they impart, and their power of subjugating hypochondriacism, dyspepsia, and nervous complaints.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2s. post-free.**
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

Clovenfords, July 20, 1892.
THE BUSINESS CARRIED ON BY US here, for more than twenty years, under the Firm of **W. THOMSON AND SONS**, has been, for convenience of Management and Settlement, CONVERTED INTO A LIMITED COMPANY, and will be conducted exactly as hitherto, under the Firm of **W. M. THOMSON AND SONS, LIMITED**.

MR. W. F. TAYLOR (late with Messrs. Little & Ballantyne, Seed Merchants and Nurserymen, Carlisle), has the pleasure to intimate that he has commenced business at the address stated below, under the style of **TAYLOR AND THOMSON**.

Mr. Taylor takes this opportunity to thank his many friends throughout the country for the courtesy and support accorded to him during his long connection with the Seed and Nursery Trade, and he trusts that by personal attention to all commands he will secure for his firm a share of patronage and confidence.

SALES BY AUCTION.

Streatham Hill.

A few minutes' walk from the Tulse Hill Railway Station.
UNRESERVED SALE.

By order of the Owner, who is leaving the neighbourhood.

MESSRS. PROTHEROE AND MORRIS will SELL by Auction on the premises, Hughenden, 19, Palace Road, Streatham Hill, S.W., on TUESDAY NEXT, July 26, at 1 o'clock precisely, the whole of the STOVE and GREENHOUSE PLANTS, CAMELIAS, and AZALEAS, ASPIDISTRAS, PALMS and FERNS, a few ORCHIDS, CHRYSANTHEMUMS; the erection of Three Greenhouses, Pits, Hot-water Piping, Boiler, Lawn Mower, Garden Tools, Pots, Ladders, Light Spring Bath Chair, and other effects.

On view day prior and morning of Sale. Catalogues may be obtained on the premises, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Stamford Hill. Without Reserve.

ABSOLUTE CLEARANCE SALE. By order of the Proprietor, who is going abroad, and relinquishing the Business.

IMPORTANT TO PALM GROWERS, DECORATIVE FLORISTS, and OTHERS.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION on the Premises, The Palm Nursery, 106, Stamford Hill, N., a few yards from the Stoke Newington Station, G. E.R., on WEDNESDAY and THURSDAY NEXT, July 27 and 28, at 12 o'clock precisely each day, under reserve, by order of Mr. W. Owen, the whole of the STOCK-IN-TRADE, comprising thousands of well-grown Palms in various sizes, particularly worthy of the attention of the Furnishing Trade and Private Buyers, including 100 Specimen *Latania borbonica*, 500 fine plants of *Chamaerops excelsa*, 2½ feet to 5 feet; 100 *Cocos pinnata*, good plants; large quantities of seaforthia elegans, *Areca sapida*, *A. Baueri*, *Corypha australis*, *Phoenix reclinata* and *tenuis*, *Kentia Belmoreana* and *Pouteriana*, 1000 *Draecena congesta discolor*, and *rubra*, in 48-pots; 200 *D. indivisa*, small plants; *Aspidistra lurida variegata*. The Erection of 6 Greenhouses, about 3600 feet of Hot-water Piping, mostly 4-inch; capital Steam Boiler, also 2 other Boilers, Flower-pots, Office, and other Effects.

May be viewed two days prior to the Sale. Catalogues may be obtained on the Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C., and Leytonstone.

N.B.—The Vendor has made arrangements for a large Marquee to be erected at the Nursery into which plants will be removed. The Sale will take place in this Marquee, which will afford ample accommodation for intending purchasers to view the plants, and avoid walking through the Greenhouses.

Building Land at Cheshunt, Herts.

Payment on the twelve years' system, if desired.

MESSRS. PROTHEROE AND MORRIS will offer for SALE by AUCTION, in a Marquee on the Estate, on THURSDAY, July 28, 1892, at 5 o'clock precisely, 98 Plots of FREEHOLD BUILDING LAND, situated about a mile from Cheshunt Station on the G. E. Railway, and in a district most justly celebrated for its picturesque scenery, for the healthiness and productiveness of its soil, and for the beautiful walks abounding throughout a grandly-timbered country. Though only about 13 miles from the City, and the population of the parish about 10,000, it is, nevertheless, exquisitely rural and scattered, and forms the centre of a large Rose-growing district. The estate is within sight of the park gates of Sir Henry Meux, through whose grounds there are lovely walks accessible to the public, and upon his property Temple Bar has been lately re-erected. The main sewer is laid in all roads, and Local Board's water laid on; and altogether this Sale offers an unique opportunity to City men of obtaining a building site within 35 minutes of town with beautiful surroundings.

Particulars and conditions of Sale may be obtained of Messrs. KEBBY, SON and VERDEN, Solicitors, 14, Great Winchester Street, E.C.; of the Freehold Land and Building Corporation (Limited), 14, Wormwood Street, E.C.; and of the Auctioneers, 67 and 68, Cheapside, E.C. Second-class railway tickets may be obtained by intending buyers from the Company at 1s. 10d. each, which will be refunded to purchasers. Conveyances will be in waiting at the station. Dinner will be served to purchasers at the close of the Sale.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 29, at half-past 12 o'clock, *DENDROBIUM LINGULIFORME*, an extremely rare and interesting species of dwarf habit, with thick tongue-like leaves. Its elegant slender spikes bear each about a score of pure white fragrant flowers. The plants, which were collected in New South Wales, are in fine masses and in fine condition.

ANGRÆCUM ARCUATUM,

a very fine species with wax-like white fragrant flowers.

The fine yellow *POLYSTACHYA SMEDEEYANA*, and other species.

Also various ESTABLISHED ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.

A NEW LELIA.

MESSRS. PROTHEROE AND MORRIS will include in their ORCHID SALE on FRIDAY NEXT, July 29, 150 plants of a NEW LELIA, collected and sent home by Mr. F. Pechacek for unreserved sale. The collector writes that he found the plants in the Sierra Madre Mountains, and that they are not *Lelia Arnoldiana* or *albida*, but quite different, and must be new. Two dried flowers taken from a spike found on one of the plants will be shown at the sale.

On view morning of Sale, and Catalogues had.

Arlesey, Bedfordshire.

On the main line of the Great Northern Railway, midway between Bedford and Baldock, and close to the ARLESEY Station, THE "WATERLOO" FARM, a Freehold and Tithed Estate of valuable GARDEN LAND, containing 330 acres, and having an extensive frontage to the road from Arlesey Station to Stotfold, let to Mr. Daniel at an annual rental of £875, to be SOLD by AUCTION, at the "Sun Hotel," Hitchin, on TUESDAY, July 26, 1892, at 4.30 o'clock precisely, by

MR. J. R. EVE and Mr. GEORGE JACKSON (who are jointly concerned).

The "WATERLOO" FARMHOUSE and HOMESTEAD and 230 acres of GRASS and ARABLE LAND will be offered in One Lot, and the remainder in Ten Lots, to suit the convenience of purchasers.

Also, the "OLD OAK" PUBLICHOUSE, Garden and Paddock, within 200 yards of the Arlesey Station, and a Plot of BUILDING LAND adjoining, both now let to Mr. Page, of Ashwell Brewery, at the rental of £50 per annum.

The tenancies of the whole of the Estate will terminate at Michaelmas next. Three-fourths of the purchase money will be advanced (if desired), on mortgage, at 4 per Cent. per ann.

Particulars and Plans can be obtained of Messrs. PRESS AND INSKIP, Solicitors, Bristol; of Mr. J. R. EVE, Bedford, Hitchin, and Luton; and of Mr. GEORGE JACKSON, Hitchin, Baldock, and Royston, Herts.

Ivinghoe, Aston.

Two miles from Cheddington Station, on the London and North-Western Railway.

MESSRS. CUMBERLAND AND HOPKINS have received instructions from Mr. W. Ashby, to SELL by AUCTION, in Nine Lots, on FRIDAY, July 29, 1892, at 4 o'clock, several ORCHARDS of FRUIT, about 25 acres in extent. The Orchards consist of Prunes and Damsons, and there is a capital crop. The usual credit will be given, on approved security.

May be viewed at any time, on application to Mr. ASHBY, of whom Catalogues may be had; also of the Auctioneers, High Street, Leighton Buzzard, Beds.

WANTED TO PURCHASE, a genuine NURSERY and FLORIST BUSINESS. Country town preferred.—Reply, A. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED BUSINESS, for Disposal.—Well situated, and near station in a city in the north of England. Terms moderate.—Apply, B. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

To Nurserymen, Florists, &c.

SUBSTANTIAL NURSERY PREMISES, constructed at great cost (Leasehold—over 60 years to run), to be DISPOSED OF, by Executors, at a small nominal premium. The premises are in working order, and comprise Greenhouses, Dwelling-house, Gardener's Cottage, Stabling, &c.; about 6 miles from Covent Garden, London.

Particulars will be furnished upon application to A. Z., 2, Wisteria Road, Lewisham, S.E.

LEYTON (Essex).—TO BE SOLD, FIVE GREENHOUSES, well-heated, and in good repair, standing on about ½ acre of ground, viz., Span-roof, 47 by 18. 47 by 14, 45 by 13; Lean-to, 89 by 12, and 21 by 7½. Lease will be given of ground and six-roomed dwelling-house, and if needed more ground can be had near. Man with small capital could do well, good opening for jobbing.

Apply, SMAIL AND CO., 23, Lime Street, London, E.C.

FLORIST and NURSERYMAN'S BUSINESS, with large JOBBING TRADE attached.—Two compact Nurseries, about 3 acres in extent, 8 Greenhouses, Stabling, 9-roomed Dwelling House. Good position in important fashionable suburb of London. Total rental £198 reduced to £74 by letting off. Price for Stock, Greenhouses, and Building, £1100 or offer.

Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

ESSEX.—About 12 miles from Covent Garden. To Fruit and Plant Growers, 16 GREENHOUSES, 2 ACRES of GROUNDS, and DWELLING-HOUSE. Rental and particulars on application to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

THE

Gardeners' Chronicle.

SATURDAY, JULY 23, 1892.

COMMERSON.

The story of *Philibert Commerson, Botanist and Traveller, and Jeanne Baré (1727—1773).*

WHO was Commerson? Who was Jeanne Baré? Alas! how few readers of the *Gardeners' Chronicle*, who can talk glibly enough of the Commersonia, or of the Baretia, of the Bougainvillea, the Poivreia, the Lalandia, the Veronia, the Cossignia, the Chaza'ia, the Jossignia, the Colletia, &c., can tell the inquirer as to the origin of these denominations; who Commerson and Baré were, who can even tell the period when Bougainville or Pierre Poivre lived, who can give the slightest idea of the personalities of Lalande or Véron, who can even suggest the Christian names of Cossigny, of Chazal, or of Jossigny, or Collet. A century ago, this would not have been the case, for, although our modern globe-trotters did not then exist, there were great souls and good, then as now, whose fame extended across the Channel, but whose names were perhaps more familiar to the scientific gardeners and botanists of our comparatively benighted island before the sun of the old French Monarchy had set in the stormy times of "Quatre-vingt-treize." The world was larger then, the names of the philosophers fewer. Now, the world has narrowed to smaller dimensions, whilst the roll-call of philosophers is crowded. Philibert Commerson, according to Du-Petit-Thouars and Emile Vinson, his biographers, was born on November 18, 1727, at Châtillon-lès-Dombes, where his father was Notary and Counsel to the Prince of Dombes. When his literary studies were over, he went to study medicine at Montpellier in 1747; there he took his degree as Doctor, and for four years devoted himself to the study of natural history and botany. At this time he commenced the formation of a herbarium, which was at his death—and, indeed, which is perhaps now—the finest and richest collection of different species gathered in all quarters of the world, that any one man has ever amassed single-handed in one collection. All the young medical students who frequented the College of Montpellier were admiring witnesses of his attainments and wonderful energy, so that his reputation soon spread throughout Europe. Linnæus soon wrote to him, and engaged him to collect and describe the rarer fishes in the Mediterranean Sea, hitherto undescribed and wanting to complete the collection of the then King of Sweden. This work occupied him several years, and formed the completest Ichthyology in those days obtainable by the means at his command. This commission procured for him the opportunities of making an immense amount of observations of the greatest interest. Needless to say, that the King of Sweden was more than satisfied at the results of Commerson's indefatigable labours, and this satisfaction was

shown by royal presents most flattering to the young and ardent naturalist. In 1755, Commerson proceeded to Geneva on a tour for the purpose of collecting alpine plants on the mountains of Savoy and Switzerland; and he also visited Berne, where he met the illustrious Haller, with whom he had been for some time in correspondence.

In the following year, 1756, he established a botanical garden at Châtillon, and thence went on tours over the mountains of Auvergne, and through Dauphiné and Mount Pilate, near Lucerne. Meantime, he struck up an intimate acquaintance with Lalande, the great Lalande, a fellow-countryman, and native of the same province, with whom he ever remained on the most cordial and affectionate terms throughout his lifetime. It was Lalande who persuaded his friend to come to Paris, where he arrived in 1764; and some time afterwards he was selected as an expert naturalist to accompany the expedition which was then being projected to undertake a voyage of discovery under the command of Captain Bougainville.

It was a glorious age for the sciences, for letters, for philosophy, for discovery, in France at this period. Among the savants were to be found Linnæus, Buffon, Daubenton, and Jussieu; among the first ranks, already Cuvier was coming to the front. Voltaire, although a confirmed valetudinarian, represented literature as Lalande astronomy. Bougainville, who saw his road to fame more surely by discovery than by war, burned to distinguish himself and the French navy by the exploration of new worlds, begged his sovereign, Louis XV., to despatch him at the head of an expedition to exploit the unexploited regions of the globe—and the king consented. Lalande instantly comprehended the advantage of securing the post of naturalist of the expedition for the man best qualified and most competent to undertake the onerous task, and had the satisfaction of obtaining the appointment for his friend—but, that friend he was never to see again—"the path of glory leads only to the grave." Bougainville returned, the riches collected by the naturalist came back to Paris, but his friend never got back to receive the crown he had justly won, he never came back to France.

And now there commenced one of those strange, remarkable, romantic events, which at intervals occur to remind us that true stories of real life are, in fact, far stranger than the fantastic conceptions of fiction. To all intents and purposes, Philibert Commerson was a practical matter-of-fact man, a hard-working, keen observer of life, animal and vegetable, in all its wonderful series of transformations, yet for years in close contact with him, there existed a most surprising case of mimicry, so aptly concealed, that until it was revealed to him by the keener observation of untutored savages in another hemisphere, he never dreamt of its possibility; nor indeed could such a possibility ever have occurred to his mind.

Commerson was at Rochefort, making his preparations for the voyage, before joining his ship at Nantes, when one fine morning, after making enquiries for a servant who could act as his personal attendant on board ship, he was told that a young lad wished to see him, and offer his services. On being told to enter, Commerson beheld a youth, slight, but apparently active, evidently willing and zealous. M. Vinson describes the young fellow, who gave his name as Jean Baret, to have been in appearance profoundly grave and sad, who, although of delicate frame, was evidently endowed with a supernatural energy, and, altogether, a manly, resolute young stripling.

He answered all Commerson's questions satisfactorily; the fame of the unusual expedition round the world had attracted hosts of young adventurers who were willing to go at all hazards, and Commerson was mainly intent on obtaining as an assistant some one less horny-handed than the grim sons of Nep-

tune, who would be likely to tend his much-beloved specimens of natural history with lissome fingers and intelligence. Baret spoke with an accent superior to most of the other applicants, and showed uncommon aptitude for handling and manipulating the savant's instruments and preparations of specimens; and, moreover, he was most earnest in his entreaties to be allowed to accompany the naturalist.

"You will never find anyone who can be more devoted to you!" exclaimed the boy. "I shall do my utmost to obey you, and follow your instructions implicitly. I feel that I shall be really able to assist you, and I care not what dangers I encounter, but in all you may trust me thoroughly in whatever part of the world you take me. I may not have the strength of a full-grown man, but I have intelligence, and am willing to learn whatever you may teach me in the art of preparing your specimens."

"All right," I will take you," said Commerson.

formed a dam across the water with large stones. Immediately below this dam, but not quite touching it, he arched over the stream, for a distance of 9 or 10 feet, with some large boulders of irregular shape. The water flows over this dam, and makes pleasant music as it rushes down and disappears amongst the boulders. It is always a pleasure to watch the trout below the arch, curving their lissome tails, and darting out of sight the moment they perceive a "peeping Tom" or a shadow falling on the water. In this case the stream is remarkably clear and bright, flowing as it does for some miles from its source over sand and gravel. Every pebble at the bottom can be clearly seen, and as some high adjacent hills produce several streams which are all tributaries to that in my friend's garden, the body of water is considerable, and it flows out from amidst the boulders with exhilarating force. The fast flow of water prevents the dammed-up part of

FIG. 13.—GLADIOLUS COLVILLEI: PRODUCING WHITE FLOWERS ON THE SAME SPIKE WITH THE RED. (SEE P. 91.)

"*C'est une chose entendue.*" According to Vinson, Commerson did not even look at the boy, when thus engaging him as servant; but this is not likely. S. P. O.

(To be continued.)

TROUT IN GARDENS.

A FAST-RUNNING stream of clear water is always a welcome ornament in a garden, and so are the trout which thrive in such water, the handsomest of the trout family being *Salmo tario*, the common brown trout with red spots. The *Salmo leuvenensis*, the Loch Leven trout, is less ornamental than the above, though equal to it in flavour. Some years since, a gentleman of much good taste in landscape gardening, greatly improved his lawn by adding to it water and trout. Having diverted a stream, he brought it through the midst of the lawn, and at a distance of two-thirds from the point of entry he

the stream from becoming stagnant, and here some of the biggest trout are found. On the margin of the lawn several tall clumps of *Osmunda regalis*, and some handsome specimens of deciduous Cypress are fed by the water below, and are making rapid growth.

The trout have certainly added largely to the interest of my friend's garden, and although he requires a certain number of them to yield up their lives every year, they have continued to increase. I would remind those who have the opportunity and desire to follow my friend's example, that trout love shelter in the form of over-hanging foliage and over-lapping banks, or jagged roots of trees, or large stones in the water. In streams that run through meadows the sod upon the margin prevents the ground from caving in, even when the earth beneath has been undermined by the current, and this is the sort of shelter the trout delights in. In a lawn, however, the banks should be kept neat and

in good repair, and with this object my friend has embanked the stream with walls of sandstone, laying the stones roughly, so that Ferns, Sedums, and other plants may grow in the crevices and drape the banks, while the top of the wall is partly covered by a carpet of alpines. Among the most attractive of these may be mentioned that charming Thyme, which clothes itself thickly with small white blossoms in June; *T. Serpyllum*, and another plant of the same family, *T. lanuginosa*, which clings tightly to the rock, and is so exceedingly neat and pleasing that its relatively inconspicuous blossom detracts nothing from its beauty.

It seems that the gardens of South Africa will soon obtain the trout as an ornament. An attempt was made to introduce trout at the Cape eight years ago, and fish of 3 lb. weight were afterwards taken in the Breede River. Most of the fry were poisoned, however, by the action of the soft water of the river on the zinc lining of the hatching boxes, and the

piece of fine muslin. The ova are placed on the muslin, and the process is repeated twice with each box. Several boxes are enclosed in a large case, perforated top and bottom, and ice is used continually to keep the temperature sufficiently low to arrest hatching during the voyage. Hatching recommences within twenty-four hours of the arrival of the ova at their destination, and in two or three days the embryo trout begin to appear. The fry are fed on baked liver, meat, &c., chopped fine, and in about a year they become fit for removal to the rivers. It is intended to send out some salmon ova to the Cape next January, but it seems doubtful whether salmon will succeed anywhere in the southern hemisphere. They have not done so in any part of Australasia, where thousands of ova have been successfully hatched, and the young salmon "parrs" turned into the rivers. In about a year the parrs become "smolt," and commence their journey to the sea, and this annual migration has

conditions? In some cases it may arise from the dissociation of previously mixed elements. But this will not explain the following case, noted by Mr. Burbidge, who sends us a *Gladiolus Colvillei*, "The Bride, bearing a typical red flower of *G. Colvillei* in the middle of the spike, i.e., both white flowers and one red flower are borne on the same spike. This 'break' or 'sport' seems to show that the characters of *G. Colvillei* proper (especially the colour so often a shifting quantity in *Gladioli* and other flowers) really lie latent in its offspring 'The Bride;' but why they so seldom become evident is not so well known." (See fig. 13.)

Another curiosity of a cognate character we have seen several times in *Azalea mollis*. Our illustration, (fig. 14) taken from a specimen sent to us last year, is precisely similar to one exhibited this spring by Messrs. Paul & Son. Some of the flowers of the truss, as will be seen, are on shorter stalks, much smaller than their fellows, of a white colour, and with very short anthers and style, so that both are included within the flower-tube. Whether these white flowers indicate a reversion to an earlier state, or whether they are merely cases of degeneration, is more than can be told. As throwing a little light on this subject, we notice the prevalence of "running" in flake and bizarre Carnations, the latter being the worse. This departure from the normal colouring of these flowers is caused, say the growers, by the low temperature that prevailed at certain periods during the formation of the flowers, and to the recent heavy rains, and the fact that "run" blooms are rarely found in plants which have been grown from the first under glass protection, seems to favour the supposition of the growers.

FIG. 14.—AZALEA MOLLIS, WITH DIMORPHIC FLOWERS, THE LARGER ONES BUFF-COLOURED, THE SMALLER PURE WHITE.

surviving fish have since disappeared through neglect. The introduction of fresh ova has now been accomplished, and a spring of water having a uniform temperature of 62° Fahr. has been utilised, as it was found that the fish are liable to succumb from the effects of heat when the water in their ponds and streams has been allowed to run too low. Early in the present year, 100,000 trout ova were obtained from the famous breeding establishment in the Wey, near Haslemere, belonging to Mr. Thomas Andrews, of Guildford, and an expert to superintend the experiment, has been sent out from this country by the Agent-General of the colony. The process of hatching the ova commences in England. In fact, the freshly-deposited ova are too frail to be handled. After thirty days' hatching, the eggs become firm enough to be moved, and they are then packed in thin iron boxes 12 inches by 9 inches, perforated at the sides and bottom. The bottom of each box is covered with moss, on which is laid a

been observed in Australia, but unfortunately the salmon have never come back to the rivers again. The salmon, however, is not a very frequent ornament of gardens, though we could mention several gardens whose attractiveness is greatly enhanced by their presence. As for trout, we could name a garden where the Loch Leven variety prospers in a pool partly concealed amidst shrubs. Water is kept always flowing into the pool by a small pipe, and the fish are regularly fed, and grow amazingly. They are tame, and, if not particularly ornamental, they are, at all events, amusing. H. E.

DISTRIBUTION OF COLOUR IN FLOWERS.

ONE of the many mysteries attendant upon plant-life concerns the distribution of colour in certain cells. Why should it be present in some cases, why absent in others, under what seem to be precisely similar

CULTURE OF THE TUBEROSE.

THERE are few cultivated bulbous plants that are so easily managed—when their treatment is properly understood—as the Tuberose, and there are fewer still that command such a ready sale, and yield such good returns. It ranks, as it justly deserves to do, among the choicest and most useful of flowering plants in summer, autumn, and winter months, and to say that the individual blooms of the Tuberose—of which the spike of a well-grown plant contains from forty to fifty—are almost equal to Gardenias, would not be an exaggeration. As a decorative plant, the Tuberose, when associated with Ferns and other suitable plants, is very effective, but it is for purposes of personal adornment and in bouquet-making that its flowers are especially useful; and, owing to their flowers expanding in succession daily at the bottom of each spike, a dozen or two of plants in bloom would suffice for the requirements of a private family for a period of four or five weeks. By potting about one dozen tubers at intervals of a fortnight or three weeks from February to the end of June or July, the supply of flowers may be extended from May well into the new year.

The Pearl, a dwarf American variety, growing from 3 to 4 feet high, is the best one to cultivate. It should be potted in 3-inch pots, burying three-parts of the bulb in the soil, which should consist of sandy loam and a little sweet leaf-mould; and previous to being potted, the bulbs should have the old roots cut away, and all the bulblets rubbed off, and afterwards all the suckers excepting the principal one, which springs from the crown as soon as they appear, otherwise failure to flower may result. After potting, plunge the pots to the rim in a propagating pit, Melon or Cucumber frame, watering them then, but afterwards keeping the soil on the dry side till top-growth begins. I have been very successful with early batches of plants started in boxes about 30 inches long, 10 inches wide, and 6 inches deep, and three-parts filled with clean sawdust, in which the pots were plunged, the boxes being placed over hot-water pipes in the Melon and Cucumber-houses, and covered with glass.

Later in the season Melon and Cucumber frames are well adapted to the requirements of the plants till they require more head room, and although

the plants start better and more regularly into growth when the pots are plunged in a bed with a gentle bottom-heat, I may say that during the months of June and July the plants will do satisfactorily without bottom-heat, simply standing the pots on the soil in what may be called cool Melon pits, that is, pits in which the necessary degree of heat for the growth of the Melons is obtained by husbanding solar heat. As soon as the flower spike has attained to a height of about 6 inches, the plants, being sufficiently moist at the roots, should be shifted into 6-inch pots—their flowering pots—and water withheld from the roots for a few days, until the roots have seized on the new soil, and as the pots become filled with roots, weak liquid manure should be afforded, and occasionally a surface-dressing of Thomson's Vine and Plant Manure immediately before applying clear water, and keeping the stems clean of the manure. I have also found applications of Farmer & Co.'s manure productive of large spikes of good flowers, the change of stimulating manure acting beneficially. After the plants become too tall to stand any longer in the Melon pits, &c., they should be transferred to a forcing-house, where they should stand as near to the glass and light as circumstances will permit, syringing them thoroughly morning and afternoon at closing time with tepid water so as to keep them free from red-spider, an insect that is liable to infest the foliage in the temperature of a forcing-house if not washed overhead as recommended. As soon as the plants begin to flower, they should be placed in the greenhouse or conservatory, the drier and airier atmosphere there maintained being congenial at that stage. In conclusion, I may say that the plants should be afforded sufficient air to insure a sturdy growth, and supports afforded the flower spikes in due time.

Treatment of the Bulbs before being Potted.—The bulbs when received from the dealer should be all trimmed in the manner described, and then spread out on a shelf in a cool but dry house, where the temperature is not likely to fall much below 35°, putting them in the order in which they are to be potted up in batches during the interval from the beginning of January to the end of July. In this way it will be easy to examine them whenever a batch is to be potted, removing any offsets that may be showing on any of them. This examination of the bulbs is of value. Should those intended for potting in June and July be overlooked until potting time has arrived, several of the bulbets will be found to have pushed into growth, thereby wasting the forces of the bulb and ensuring weak flower-spikes. I annually flower about 400 bulbs of the Tuberose, which are potted in successive lots of from thirty to fifty, at intervals of about a fortnight from the beginning of the year to the end of the month of July. Should any of the late-potted bulbs fail to flower during the winter months, all being well, they will send up good spikes the following summer. *H. W. Ward, Longford Castle Gardens.*

ORCHID NOTES AND GLEANINGS.

CATLEYA MENDELI "MRS. BROOMAN WHITE."

The chief things on which the Arddarroch collection of Orchids at Garelochhead, Dumbartonshire, prides itself are the fine collection of varieties of *Cattleya Mendeli*, and of *Odontoglossum crispum*, and in both these specialties they excel. Yet another superbly-coloured form of *Cattleya Mendeli*, named in honour of the wife of the proprietor, comes to hand. It is a well-formed flower, sepals and petals white, tinged with lavender colour. The front and basal part of the interior of the broad and beautifully-crippled labellum is almost entirely of a rich purplish-crimson, there being only two patches of yellow, one on each side of the throat. The upper part of the side lobes folded over the column is white. A noble-spotted form of *Odontoglossum crispum*, of great size, also comes from Mr. Brooman White.

REMOVING THE FLOWER-SPIKES OF ORCHIDS.

I was admiring some very pretty flowering plants of *Oncidium concolor* at the great exhibition of Orchids in the Temple Gardens, when an eminent orchidist remarked, that he never could maintain his plants of that species long in good health and vigour unless the flower-spikes were cut off, or, rather, pinched off, before the flowers opened, this being done in alternate years. *O. concolor* is not the only species of Orchid that is benefited by this kind of treatment. I was some years ago much interested in well cultivating a fine specimen of *Oncidium macranthum hastiferum* for an exhibition in June; one year it was exhibited splendidly in flower, and the flower-spike—a very long one—was allowed to remain with all the flowers until they passed away naturally. I found the next season that the spikes were not so long as in the previous year, and the flowers opened too late for the exhibition, which was held at about the same date as before. These spikes were allowed to remain, and next year we were like to have had a still later bloom, so I cut off all the spikes as soon as they showed out of the sheathing leaves, with the result that the new growth was more vigorous, and the pseudobulbs earlier in forming, giving us strong early spikes the next year; we lost, of course, the bloom of one season. The way to obtain these *Oncidiums* early in the year would be to grow plenty of plants, and allow a few to rest annually. Some cultivators may say that this *Oncidium* or that, which many

FIG. 15.—BOUGAINVILLEA HOUSE, AT CLIVEDEN, BUCKS.

cultivators fail to manage, is no trouble to them, and that they flower well every year, and grow freely. This is so, for either owing to the construction of the houses, or some trait in the culture of the plants, one man may succeed and another fail with certain Orchids difficult to manage. I wrote in the *Gardeners' Chronicle* some years ago about the success obtained by the R.-v. F. D. Horner in his garden at Low Fields with *Cattleya citrina*; this year the plants were better than ever, producing flowers freely, and sending roots down 18 inches below the blocks on which they are growing; and few specialists, if any, have ever obtained such excellent results. Mr. Horner has nothing particular to say about his treatment; the plants are hung up close to the glass over the path, and never suffer for want of water—he does not believe in drying them off, even in winter. *J. Douglas.*

BOUGAINVILLEAS.

The perplexity that exists in India and elsewhere as to the correct names to be applied to the species and varieties of Bougainvillea, has induced us to apply to Mr. Watson, of Kew, for the benefit of his experience in the matter, and which he has kindly afforded in the subjoined note. When the Bougainvillea was first flowered in this country, at Swyncombe, under the care of Mr. Daniell, great was the excitement. Mr. Daniell grew his plant in great heat, and especially with great bottom heat. We now know that great heat is not required, and Mr. Fleming, of Cliveden, was one of the first to show that it will grow in an ordinary greenhouse, with no

bottom heat at all. Our illustration (fig. 15) shows how this may be effected, the roots being at first confined in a brick cage, but subsequently extending beneath the stage into a border of brick rubbish mixed with soil, which affords ample drainage. The Bougainvilleas are natives of Mexico and tropical South America, but are now universally diffused in warm countries. Who Bougainville was is told in the article on Commerson in another column.

"There are," says Mr. Watson, "only two distinct species of Bougainvillea in cultivation in England, or anywhere else, so far as I know, and the correct names for these two are *B. glabra* and *B. spectabilis*. Unfortunately, the latter has received several other specific names, and as cultivators insist upon retaining these several names for what they consider quite distinct kinds, we have as a consequence a confusion of names.

"With regard to *B. glabra*, it is unnecessary to say more than that it is a well-marked species, and one of the very best of climbers for the warm greenhouse or stove, and a popular garden plant in all parts of the tropics where the European dwells. Although a Brazilian plant, it is said to have been introduced into England from Mauritius in 1861 by Mr. J. Daniells, of Swyncombe Gardens, Henley-on-Thames, who obtained a First-class Certificate for it from the Royal Horticultural Society in September of the same year.

"*B. spectabilis* was first flowered in England at Chatsworth in 1844, by Sir Joseph Paxton who published a figure and description of it in his *Magazine of Botany*, vol. xii. In 1854 it was figured in the *Botanical Magazine*, where Sir William Hooker stated that, 'in respect of colour, the bracts (flowers) are exceedingly variable.' I have seen them pure rosy-pink, rosy-purple, and almost crimson, but I have never seen any that could be called rich purplish-blue, the description given by Mr. J. H. Veitch in his notes from Bombay, published in the *Gardeners' Chronicle* on April 2. In Madeira and at the Cape I have seen magnificent specimens of this species, covering the fronts of houses, scrambling over verandahs, or draping high walls with its flower-laden branches. The leaves vary in size and in hairiness, and in some plants the branches are much more spinous than in others. But all these variations are of a minor character, and are certainly not worth distinguishing with names. Dr. Lindley described in the *Gardeners' Chronicle* in 1861 a plant which he called *B. speciosa*, and which he said differed from *B. spectabilis* in having compact heads of flowers on very hairy stalks, the latter species being characterised as having a loose and sparse inflorescence. But this distinction is not now considered good enough, and latterly all botanists call by the name of *B. spectabilis* all those plants which had previously been called *B. bracteata*, *B. braziliensis*, *B. speciosa*, *B. splendens*, and *B. peruviana*.

"There is, however, a very distinct variety of *spectabilis*, which was figured in the *Floral Magazine* in 1865, t. 260, and in the *Illustration Horticole* the year following, under the name of *B. lateritia*, this name, which means brick-red, having allusion to the colour of the bracts (flowers), which are the colour of bright red bricks; or, as some one has described it, dull flame. In all other respects this plant is identical with the ordinary *B. spectabilis*. I have had specimens of it from Madeira, Egypt, the Riviera, and several English gardens, and Mr. Goldring informs me that it is a common plant in India. It is in cultivation at Kew. Some people prefer its flowers to those of *B. spectabilis*, others do not, and some cultivators call this the true *B. spectabilis*, retaining the name *speciosa* for the rosy-purple plant. Briefly, the nomenclature of garden Bougainvilleas is as follows:—

"*B. glabra*, a loose grower, with thin branches, pale green, nearly glabrous leaves, and rosy-mauve bracts.

"*B. spectabilis*, a very woody climber, with stout spines, rather thick leaves, more or less hairy, and large bracts, sometimes 2 inches long, coloured rich rosy-purple, or rosy-crimson.

"*B. var. lateritia* differs from the type in having the bracts coloured brick-red or dull-flame." *W. W.*

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, JULY, 1892.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

** Fuller details will be given in the following number. See also Leading Article on page 100.

FLORISTS' FLOWERS.

LARGE-FLOWERING PELARGONIUMS.

The time has arrived for hardening off and cutting down large-flowering Pelargoniums which bloomed in May and June. Cutting down is regulated to some extent by the time when it is required that the plants should be in bloom the next season; those required to be in flower in May and June should be cut down early; those to flower in July and August should be cut down later. Previous to cutting down, it is the practice to "dry off" the plants, that is, water is withheld, a practice which matures the wood, both old and young. If the plants can be put out in the open, and laid upon their sides, they will do as well there as anywhere else. A good ripening of the wood is better both for the old stool and the wood out of which cuttings are made; for the harder the wood for cuttings the better do they strike, and there is no art in rooting them. They can be put into a bed of light sandy soil in a frame, or into pots of the same compost, and stood on a greenhouse shelf; or, for the matter of that, they can be put out on an open border, and shaded from the sun, and they will quickly root. I have seen cuttings of large-flowered Pelargoniums put in which looked like pieces of dry sticks, but they rooted quickly, and made excellent plants.

After the plants have been cut down, they should be put into a cool frame and sprinkled overhead every morning until they begin to break into growth, and then they can be potted. Those first cut down will be sufficiently broken to be repotted towards the end of August, turning the plants out of the pots, shaking the soil from the roots, and trimming them somewhat, and then repotting in pots that will just contain the roots, using a compost made up of

fine yellow loam, leaf soil, and sand, taking care in the act of potting not to break off any of the young shoots being put forth from the old wood. The plants should be placed in a cold frame, be kept close for a few days, and shaded from the sun, and occasionally have a gentle sprinkle. As soon as they show signs of growth they can be taken to a cool well-ventilated plant house. The plants required for early flowering should be placed in their blooming pots about the end of September or early in October; on this occasion using such a compost as that before mentioned, but adding some well-decomposed manure. As the plants have made considerable progress in growth, repotting should be done with great caution. During the latter part of September and during October, the plants should be well housed on a lean-to stage, without crowding them, and where there is plenty of light; they being kept warm, that is a night temperature of 50° is permissible, and 65° by day, so as to encourage growth, and have plenty of air during the morning. It should always be borne in mind that specimen Pelargoniums in order to flower them well, must make their principal growth before Christmas.

Cuttings, as soon as sufficiently rooted, should be potted singly into small pots in a compost made light by the addition of leaf-mould; and as soon as established, shifted into large 60 or 48-sized pots. They should be kept warm and encouraged to make a free growth, and as soon as well-established after the second shift, the top of the leading shoot should be pinched-out, which causes it to break into side shoots, and thus bushy plants are formed. Such plants as these, if obtained from a nursery in November, can be grown on into excellent flowering specimens by June. A dozen fine large flowering varieties will be found in Ambassador (Foster), Amethyst (Brebant), a variety remarkable for its rich purple colour; Claribel (Hoyle), pure white;

Corsair (Foster), Despot (Foster), deep crimson, fine in colour; Duke of Norfolk (Foster), deep crimson-scarlet, very bright; Fortitude, (Foster), Maid of Honour (Foster), Martial (Brebant), Outlaw (Foster), Ritualist (Foster), and Sister of Mercy (Foster).

Among what is known as the decorative section, there are some very fine varieties, well worthy cultivation either for exhibition or house decoration; and a good selection will be found in Duchess of Edinburgh, Empress of India, Formosa, Gold Mine, probably representing the nearest approach to an orange Pelargonium yet raised; Lady Isabel, bright lilac, very distinct and attractive; Maggie, Mons. Desmoulin, Nellie Hayes, Radiant, Rosetta, rosy-purple, quite distinct; Spotted Beauty, and Triomphe de St. Maude, deep crimson, an excellent grower, and very free. R. D.

DWARF CHRYSANTHEMUMS.

These are the most useful of all varieties of the Chrysanthemum to those who have limited space in which to flower the plants. The present fashionable craze for large blooms causes the plants in a general way to be grown very tall, in some instances exceptionally so, and persons with low pitched houses find themselves prohibited from growing their plants in this manner. Fortunately for them, there are some new varieties which are of a dwarf character; take for instance, Middle Marie Hoste, one of the latest to bloom, and the finest of the new Japanese varieties, which is of comparatively dwarf habit. At the present date my plants of Middle Marie Hoste are but 2½ feet high, whereas plants of A. H. Neve, and Cleopatra are 6 feet in height, which makes them quite unsuitable for growers with small houses. I could give other instances of the progress now being made in this direction, and a little later I hope to be able to give a list sufficiently extensive

for most small growers of the dwarf-growing varieties, and which will comprise those with blooms equalling in size and in good quality any of the taller-growing ones. I think I hear some one say, "But cannot we have equally good blooms from the naturally tall-growing sorts by a system of culture known as the dwarfing process?" I say, no, we cannot, except in a very few instances, as it appears to be necessary for most of these plants to be allowed to assume their natural mode of growth if blooms of the finest size and quality are required. It is certainly possible to grow the plants as dwarfs and get good blooms, as long as the grower does not aspire to the exhibitionable. There are two ways of obtaining dwarf plants: one is by cutting down plants in the months of May and June to within a few inches of the ground, and allowing them to carry from three to six shoots, each one to develop a single bloom. This is the best way of obtaining plants from 2 to 5 feet high of the leading varieties; and plants so treated will have their new growth well advanced by this date, all that is now necessary being the removal of all side shoots as fast as they appear, so as to concentrate the energy of the plant in these growths, each of which will in due time produce a flower-bud at the point. This bud should form some time during the month of August, as a rule, according to the variety and the manner in which the plants have been treated. Pots 8 inches, and 9 inches for the largest, are sufficiently large for the strongest plants, carrying, say, six blooms each. The second method is to pinch out the point of the shoot, presuming the plant was grown at first with one stem until 6 inches or 1 foot high; the result of such topping is the production of additional shoots, which must be limited to three, four, or more, according to the natural size of the variety, and for the purpose the blooms are required. It is needless for me to say, the fewer the blooms the finer.

Where plants are looked to, to furnish a quantity of bloom, rather than blooms of fine quality, they may yet be dwarf, and there are two methods by which it is possible to obtain them. The cuttings are rooted, say, about the middle of the month of January, and the point of each is removed when the cutting is 4 inches high, and the resulting shoots are restricted to four on a plant. These shoots are allowed to grow without stopping till a natural break is made, and they are restricted to, say, three to each main branch, which is a total of twelve; and these in time break without being forced so to do, sending out numerous small side-growth; and these and the central shoot are allowed to develop all the blooms which form, the result being a mass of bloom on long stems which are more useful for cutting purposes than the same number of blossoms on shorter stems would be, obtained by continually topping the shoots at 4 inches up to the middle of the month of July. These latter may give a large quantity of bloom, but the plants occupy a great deal of space; and for cutting purposes the blooms are not so useful, the stalks being short and weak. I have now described my method of obtaining dwarf plants, and the culture that is necessary at the present time is to attend most carefully to affording the plants water at the roots—want of attention in this respect spoiling the foliage and ruining the appearance of the plants. Too much water at the roots has much the same result, and although the Chrysanthemum is a moisture-loving plant, it can get too much; it is surprising how long a time the plants will go and look well without water, provided they are properly potted, the soil rightly chosen, and it is rammed hard into the pots—in this state the moisture does not pass away nearly so quickly as when the soil is potted loosely. *E. Malpinus.*

THE WEEK'S WORK.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

HERBACEOUS BORDERS.—Delphiniums, Thalictrums, Potentillas, Tradescantias, Spiræa palmata, Cigars, &c., are now rendering good service, and

the only attention which the plants growing in these borders are likely to require during the next two or three months is that of keeping the ground free from weeds, removing decayed leaves and spent flowers, and affording the necessary support to the stems of Delphiniums, Thalictrums, Helianthus, Phloxes, &c., and watering them at the roots when and where necessary.

BEDDING PLANTS.—Owing to the recent heavy rains which we have had, bedding plants of every kind have made rapid and satisfactory growth, and, having discontinued picking off the blooms, the beds which are filled exclusively with flowering plants are now looking quite gay. The only after-attention necessary, until the time for taking cuttings has arrived, is to remove all faded flowers and leaves, and weeds, and to give them water when this is thought necessary. Pinch the points out of extra strong growths, so as to promote and maintain a symmetrical surface in the floral display of beds filled with Pelargoniums, Calceolarias, Verbenas, Ageratums, Heliotropes, &c., and peg down the shoots of trailing plants as occasion may arise. In the case of mixed beds, in which standard, bushy, and trailing plants are used in variety, care must be taken not to allow the stronger growers to smother the weaker ones, but each must have ample space to develop and appear to advantage. Large beds of mixed plants of irregular heights, with colours somewhat regularly distributed, are certainly very telling, and contrast well when viewed in proximity to masses of colour.

BUDDING ROSES.—The present is a capital time for carrying out this process, as the bark of both Briars and Roses is in good condition for operating upon. Although the method of budding is generally understood by gardeners and a great number of amateurs, there may be, nevertheless, some among the many readers of the *Gardeners' Chronicle* who would like to be initiated into the way of doing it. I will therefore repeat the details set forth on a previous occasion. Select shoots containing plump buds of the desired varieties of the Rose to be budded, cut off the leaves and half the leaf-stalk, label and stand them on their butt-ends in a can containing water, so that they may be kept fresh until used. Then make a transverse incision about $1\frac{1}{2}$ inch from the main stem on the upper side of a stout shoot, and from the middle of this a longitudinal one extending to about 1 inch in the direction of the stem. Next remove a bud from one of the shoots referred to by taking it in the left hand, and inserting the knife about half an inch below the bud, and with a clean sloping cut, pass the knife inwards well under the bud, and then slope outwards, so that the eye shall be in the centre of the shield thus removed. In doing this, the knife will necessarily cut off a thin slice of wood with the bud; this should be removed by turning the cut surface upwards, holding the piece between the forefinger and the thumb of the left hand. Then enter the point of the knife between the inner bark and the upper extremity of the wood, which raise a little to enable it to be laid hold of between the point of the knife and the nail of the thumb, and then with a sort of twitch, remove the wood, being careful not to injure the base of the bud. This done, with the thin handle of the budding-knife raise the bark on each side of the incision, commencing at the corners immediately below the cross-cuts. In raising the bark sufficiently to admit of the bud (held by the petiole) being gently pushed into position, be careful not to injure the cambium with the handle of the knife. Should the bark on either side of the bud be longer than the incision in the stock, cut a piece off the top end, so that the bark and cambium of the bud and stock may fit closely together; binding the bud in position with bands of soft matting or worsted, in such a manner as to exclude air, and keep the bud on the albumen, beginning at the end of the incision, and binding round and round to the top, allowing the bud ample room between the turns, and passing the end of the tying material under the last turn, so as to secure it. An expert budder can pass a large quantity through his hands in one day.

GENERAL WORK.—This will consist in mowing and sweeping lawns, weeding, and rolling the gravel walks, and hoeing them—where they are made of shell or sea-sand.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Peatrice Castle, Swansea.

AMARYLLIS.—Much depends upon the time these plants are started. Those which were started

in heat early in the season, and have been kept growing in a nice genial temperature, will now have completed their growth; still, great care must be taken that the leaves are thoroughly matured. If the plants have been stood in a light position, and they have had the necessary amount of air and water, the leaves should have plenty of substance in them. Avoid giving more shade than will prevent the foliage being injured by bright sun, as on the thorough maturity of last season's growth depends the amount of bloom to be looked for next year. Syringe the plants overhead every afternoon when the weather is bright, to keep the foliage clear of thrips and spider, which, under the drier conditions the plants from this time are subjected to, are almost certain to put in an appearance. Plants which were started late should be encouraged to make their growths; close the ventilators early in the afternoon, syringing the plants thoroughly to keep insects in check. Young seedlings should be sponged occasionally to keep the foliage thoroughly clean, and any seed which may be ripe may now be sown, afterwards plunging the pots in a gentle hot-bed made from fermenting materials.

NERINES.—This most useful plant is very seldom seen in a satisfactory condition. When the plants have completed their growth, instead of keeping them in a cold frame or pit, stand them at the foot of a south wall, so that they will get the full rays of the sun, plunging them to half their depth in coal-ashes. By treating them in this way, the bulbs will get thoroughly matured. They may remain under these conditions until the end of the summer, when they should be placed in the greenhouse, where they are intended to bloom.

SPARMANNIA AFRICANA.—Young spring-struck plants of the above which are now growing in 4-inch pots, may be shifted into pots two or three sizes larger, as soon as they are ready, and afterwards place them in a cold frame for a few days until the roots take possession of the fresh soil, when they may be stood outside on a bed of coal-ashes. Old stock which were cut back, and have started into growth, should be shaken out and repotted in a compost of three parts loam, and one each of leaf-soil and decayed manure, with sufficient sand to keep the same porous; place them in a cool house or pit until established, shade them during bright weather, and syringe the plants overhead when closing the ventilators in the afternoon. When they have commenced to make new growth, gradually harden them off before removing them outside.

EUPATORIUM WEINMANNIANUM AND E. RIPARIUM.—Shift these into larger pots as soon as they are ready—5 or 6-inch will be found large enough for young stock propagated this spring, but for plants which bloomed last year, and have been cut back, 9 or 10 inch will be required. Pinch out the points until the necessary number of shoots is obtained, but by no means carry the pinching too far, as five or six strong growths are preferable to a larger number of smaller ones. After repotting, keep them rather close for a few days, then gradually admit more air, so as to prepare them for the open.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, Syon House, Brentford.

ONIONS.—The preparation of the beds for the autumn-sown Onions should now be made by digging it deeply, employing plenty of rich, partly-decayed manure. If the maggot is feared, a slight quantity of gas-lime should be dug in. It is yet full early to sow the seed of Onions, but there is much to be gained by having the ground got into good condition for its reception. The flat and globe Tripolis, including the larger varieties of these, as the Giant Rocca, and the white Portugal, and Lisbon. The yellow Trebon is a mild flavoured, sweet, and agreeable sort, answers well for autumn sowing. By sowing a good breadth of autumn Onions, there is always a supply after the stored Onions are come to an end, or if the summer crop should fail.

CARROTS.—Seed of Early Horn Carrots may now be sown for drawing whilst young, or to supplement the spring sowings; a greater quantity of laod being sown if that sowing has failed to a large extent. If the weather be dry at sowing time, germination will be assisted by covering the beds with mats, &c. As Carrots suffer from various enemies, a change of ground is advisable, using such materials as soot, common salt, wood ashes, as a dressing in preference to rank manures.

PEAS.—Those Peas which are in bloom should be well mulched in light soils with stable dung; the mulching will be more effectual if it is preceded by a good watering of the soil on both sides of the rows, first loosening the soil with a digging-fork. Tall kinds of Peas should be topped when the desired height has been reached, thereby inducing haulm to branch out. As a preventive of mildew in Peas, a thorough watering once or twice a week will be of much service. A small quantity of the dwarf kinds of Peas may still be sown on warm borders, in rows 3 or 4 feet apart. To enable a fair crop to be gathered, good cultivation is essential.

POTATOS—Early kinds should be lifted as soon as ripe, and stored in a cool place. The varieties, Victor and Veitch's Ashleaf, have turned out excellently this season, and, though a little late, there is no trouble, so far, with the disease. Those roots that are required for seed should be carefully lifted, and laid out in the sun, and allowed to get dry before putting them into store. Care should be taken to obtain the seed true. A change of seed will frequently give better crops than seed saved of the same year by year, and should be arranged for with other gardeners at a distance. If the early Potato-ground is to be planted with winter vegetables, fresh manure may not be necessary for all of these, but deep digging will certainly be necessary.

CELERY.—To have Celery in good condition for a long period at different seasons, it requires to be planted in succession, and the earliest lot will now be large enough to receive liquid manure occasionally, or a surface dressing of some good kind of artificial manure, flooding the row with water after the application. Earthing-up should not be done too early, but as the first lot of Celery is quickly used, there is less danger in doing it than would be the case with later crops; and as it is necessary to have well-blanched sticks, the earthing-up of the earliest plants must soon be undertaken. See that the soil is well moistened before beginning operations. Late Celery should be planted as soon as large enough to lift, it being best to put out the plants before they get drawn, and there is but little check given by this early transplantation.

THE ORCHID HOUSES.

By H. A. BURBRAY, *Orchid Grower, Highbury, Birmingham.*

THE COOL-HOUSE.—*Odontoglossum crispum* is a universal favourite, and no Orchid is imported in such large numbers, or which finds so ready a sale. Many persons are engaged in growing the plants for market purposes, and find their cultivation a sound investment, the cut flowers being at all times in great request. Large and well-shaped, as well as beautifully-spotted, varieties occur in every importation of the plants, and these, if sold, often realise high prices. Few other species of Orchids are more easily or more cheaply grown than *O. crispum* when the right treatment has been hit upon; but this is sometimes missed, and then it is no easy task. The structure I prefer for this species of *Odontoglossum* is a plain and simple one. A span-roofed house running north and south is just the right one, and should be of sufficient width to admit of side-stages, and a stage in the middle, which should be brought well up to the light—that is, the top of the stages should not be more than 3 or 4 feet from the glass, and they should be stepped on each side. Ventilation should be provided at the top and the bottom, and there should be a door at each end of the structure; the side-lights need not be made to open. I have previously advised the grower to have as few obstructions to a free admission and circulation of air as possible, and that is best obtained by having simple stages for the plants, the more obstructive stage covered with moisture-retaining materials directly underneath the plants, which some growers favour, and others think absolutely indispensable, finding no place in the house. For aerial moisture, dependence should be had on a floor and paths consisting of moisture-holding substances, as coal-ashes, fine gravel, or sand, which can be moistened as may be required. The blinds, which should be fixed to rollers, if they are run down on strips of wood or wires raised 6 inches above the roof, will cause the air to circulate between the glass and blind, and thereby tend to keep the house cool in warm weather. By paying attention to the plants, the right position for them will soon be ascertained, and position is of as much or more importance in Orchid growing as the nature of the compost or the amount of water supplied to the plants. In a former Calendar

the beginning of the month of September was advised as the proper time to re-pot plants of *O. crispum*, that is, supposing them to be growing in a house such as I have described; but if it be a lean-to, facing north, it is different. In a house of this kind the plants thrive during the summer months without much trouble, but more care is necessary during the winter-time, and September is too late in the year to re-pot the plants; and if they were not re-potted early in the spring, it should be undertaken forthwith. There is no better compost for this species than Orchid peat and sphagnum-moss, to which very small crocks are added. The old compost should be entirely removed, and the new pressed down firmly, so as to make the plant steady in the pot. If the sphagnum-moss is growing too freely, and smothering the pseudobulbs, as it sometimes will do on the early spring-potted plants, it should be pressed down whilst wet with the thumb and finger, and a layer of finely-pounded crocks sprinkled on it, which will have the effect of checking its growth. The new growths must be kept free from thrips and aphides.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, *Gardener, Mereworth Castle, Maidstone.*

STRAWBERRY BEDS.—The plants of most varieties having been dropped heavily, should be attended to so soon as the fruits have been gathered, for if good strong and well-matured crowns are not prepared by the end of the season, there will be but a scanty crop next year. Remove all runners not required, a portion of the lower leaves, and all weeds, after which spread a good thickness of manure over the roots and between the rows, and if the soil be dry, as is frequently the case, beneath the plants, give a thorough soaking of water, repeating the watering at intervals till the roots have got well moistened to a good depth. Finish the layering of all young plants required if such has been delayed, get the ground prepared in readiness for planting them when in a fit condition, and lose no time in getting the early plants put out so that they may have plenty of time to grow and build up good crowns. When planting (if the young plants have been layered in small pots), give each a good watering before turning them out, and loosen the roots. Plant very firmly, especially if the soil is light and shallow; water a few times until the roots have taken to the new soil, and keep the ground free of weeds, by hoeing between the plants, and in every way possible encourage a free growth. Young plants may also be dibbled out 6 inches apart on a shady border for planting later, but these seldom bear fruit to any extent the following year. Water overhead should be frequently supplied on bright days till rooted, and the runners kept pinched out. Nets which have been in use for Strawberries should now be put over Gooseberries, Morello Cherries, &c., and any not required for further use stored away in some dry, airy shed, when perfectly dry.

GATHERING FRUIT will need daily attention, and on favourable occasions all hands should be put to this work. The fruits should at all times be gathered when perfectly dry, alike for bottling, preserving, and for the market. Cherries, and Black and Red Currants are usually forwarded, carefully packed in half-sieves, and sieves containing 24 lb. and 48 lb. net. These are supplied by the fruit salesmen. All baskets should be fastened down (first placing over the top two sheets of thick packing-paper) with sticks, and properly secured.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Cusle Howard, York.*

PEACHES AND NECTARINES.—These fruits coming on in late houses should have the fruits well exposed to the sun, the sublaterals being pinched at the first leaf from the base. It is important that Peaches and Nectarines for the late supplies should be well-coloured, sunlight being each day less; moreover, we may have a repetition of the wet, sunless autumn of last year, and every ray of direct sunshine should be utilised to give colour and flavour to the fruit. Borders that may be getting in a dry state about the roots of the trees must be thoroughly watered, liquid manure being employed if trees are weakly, or crops very heavy. By liquid manure, I do not mean that which is obtained from the farmyard tank, as this fosters the production of succulent wood at this season, if applied in a strong state; and maintain a free circulation of air at all times in the house until the

stoning period be passed. Houses in which the fruit has commenced their second swelling may be shut up early in the afternoon, and the trees syringed; this will hasten ripening, and add size in the fruits. See that the fruit in this house is not unduly shaded with leaves. When the fruits are ripening, go over the trees daily and gather the ripest, placing them in the fruit-room for a few days, if they are to be used at home; but should they have some distance to travel, it will be better to pack them when gathered. Discontinue syringing trees when the fruit becomes ripe, and only employ the syringe again to keep the trees free from the ravages of insects after it has been gathered. In such houses, however, the condition of the trees should be a guide as to treatment from the present time till the fall of the leaf, exceptionally strong wood requiring a dry atmosphere, with a fair amount of light to secure due solidity. When the plants are less vigorous, a more humid air may be afforded, but the ventilators should not be closed on any account.

THE APIARY.

By EXPERT.

SALEABLE HONEY.—It should be the aim of every producer of honey for sale to put up the article in the neatest, cleanest, and most attractive form consistent with smallness of cost, so as to keep the price to the consumer as low as possible. Although sections put up in boxes made of cardboard, ornamented with gold-lace paper and other adornments, or metal cases enamelled in various tints, look very nice, all the extra cost this entails, generally amounting to 2*l.* per section, has to go on to the price of the honey, and is simply so much waste, as the whole is afterwards thrown away. Good sections are really so attractive in themselves, that it seems almost superfluous to want to add anything to artificially enhance their appearance; and if we can devise something that will protect the delicate comb from damage when handled, and keep flies, bees, or wasps from injuring it, this seems all that is really necessary. It may be taken for granted that glass on each side of the section is indispensable for showing off its beauty to the best advantage, and the next thing is to fix it so that it will keep in position. This may be done by having the glass cut the exact size of the section, 4½ by 4½ inches, and pasting a lace paper, which may be bought for the purpose, round the edges, taking care that it does not overlap more than three-eighths of an inch, in accordance with the regulation laid down by the British Bee-keepers' Association. The chief objection to this way, however, is, that it is not always possible to produce sections free from propolis, unless they are hung in the frames when in the hive, so as to have all the outside covered. There is a cheap wooden show-case made similar to a one-piece section, with a groove on each side to slide in the glass. This would seem to answer every purpose, as it could obviously be sold at about the same price as ordinary sections, to which, adding the cost of the glass, a serviceable section-case could be procured at about a quarter of the price of cardboard or metal ones, if a general demand was made, so that manufacturers could stock them in quantity.

HONEY-BOTTLES.—The best kind of bottles to use for extracted honey are undoubtedly those with screw-caps, as, although the cost is a trifle more than a cork or tie-over one, the purchaser will prefer them, as they look nicer on the table, are more handy for closing up when the honey is put away, and are more useful for various household purposes when it is consumed.

PLANT PORTRAITS.

ANTHURIUM ATRO-SANGUINEUM, *Garden*, July 9.—In connection with this, Mr. Gower makes the interesting statement that it was he who brought the first *Anthurium Scherzerianum* to Kew, where he flowered it. He obtained it in 1862, from Herr Wendland, its discoverer. Those who remember the illustration of the plant as it first flowered, may well be astonished at the progress made.

ASPLENIUM MONTANUM, *Meehan's Monthly*, July.

CATLEYA MONSELLEI VESTALIS, *Orchidophile*, April.

ODONTOGLOSSUM BASTILABIMUM, *Orchidophile*, May, 1892.

PEAR FONDANTE DU PANISEL, STRIPED, *Bulletin d'Arboriculture, &c.*, June.

EDITORIAL NOTICES.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, JULY 26 { Royal Horticultural Society; all Committees. Lecture on "Insect-eating Plants," at 3 P.M.

SHOWS.

TUESDAY, JULY 26 { Carnation and Picotee, at the Drill Hall, James Street, Westminster.

WEDNESDAY, JULY 27 { Berkenham. Hessel (two days). Royal Botanic Society, Regent's Park, Musical Promenade.

THURSDAY, JULY 28 { Southwell Rose and Horticultural. Halifax Rose.

SATURDAY, JULY 30 { Salterhebble (York) Horticultural (Southampton Horticultural (two days). Ripley Horticultural and Rose.

SALES.

TUESDAY, JULY 26 { Stove and Greenhouse Plants, at "Hughenden," Palace Road, Streatham Hill, S.W., at 1, by Protheroe & Morris.

WEDNESDAY, JULY 27 { Unreserved Clearance Sale, at the Palm Nursery, 106, Stamford Hill, N., at 12, by Protheroe & Morris (two days).

FRIDAY, JULY 29 { Established Orchids, at Protheroe & Morris' Rooms, at half-past 12.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63° 3.

The Fruit Crops.

By the courtesy of our correspondents, we are now enabled to give in tabular form a rough estimate of the fruit crops for the year throughout the British Islands. Next week we hope to publish some of the more extended comments with which our correspondents have favoured us.

We may range the records of the most important commercial crops—Apples and Plums—as follows:—

Apples.			
	Average.	Over.	Under.
Scotland	5	3	29
England and Wales	55	8	101
Plums.			
	Average.	Over.	Under.
Scotland	8	5	23
England and Wales	31	10	114

Pears are almost universally greatly deficient. Cherries, on the other hand, have yielded generally a good average crop. Peaches, Nectarines, and Apricots are thin.

Small fruits, such as Gooseberries, Currants, Raspberries have been fairly good, as have also Strawberries, but the season has been short.

The general results are the same in Ireland as in Great Britain.

It remains now to be seen what prices have been, or which will be obtained, in the market before we can form any estimate of the commercial value of the fruit crops of the season, and of the profit they have yielded to the grower. We fear the result will not be so satisfactory either to producer or to consumer as sundry enthusiasts would endeavour to persuade us.

A GREAT deal was said some time ago in these columns and elsewhere as to the action of certain

of the County Councils in commissioning instructors in gardening to visit various districts with a view of imparting information of a character likely to be useful to the auditors. Some there were who derided the whole scheme; others who threw cold water upon it; others who performed the much more useful office of showing how, and where, and why, failure was likely to occur; and still others who pointed out the best means of achieving success. The affair was evidently one of a tentative and experimental character. For our own parts, we warmly encouraged the scheme for many reasons, the most potent among them being that it seemed to us that, if properly carried out, such a scheme could not fail to be the means of diffusing and promoting a knowledge of gardening among the rural population, a knowledge which would in the end largely contribute to their own benefit, and to the general welfare.

Another reason which commended the scheme to our approval was, that we saw in it a means of raising the position of gardeners and gardening in the eyes of the public.

The time has now come when we may appropriately take a brief survey of what has been accomplished. And from this survey, it is probable that some hints for the future may be obtained. In response to our enquiries, many of the teachers were good enough to forward to us programmes showing the subjects upon which they lectured, and to give us information as to the manner in which they treated their subject.

We have scanned these programmes with very great interest, because they were drawn up by the lecturers themselves. The lecturers were mostly practical gardeners, and as such conversant with the requirements of their auditors. So far as we know, the course to be followed was in no case prescribed by the County Council, but each man followed the course he thought best under the circumstances. Now, when we come to compare the schedules before us it is very interesting, and we may say, very satisfactory to find how nearly they resemble each other in essentials. There are, of course, little differences of detail, but the main principles followed are the same throughout. The number of lectures given and varying local circumstances, sufficiently account for what differences there are. These principles are the same that we have consistently advocated, as the appropriate ones to be followed in this particular matter.

As in reply to our request we received so many similar accounts, it might be thought invidious for us to single out any one for special comment; but by way of illustrating our remarks we may print the subjoined letter without appending to it the name of the writer:—

"The system I follow is to talk in quite plain language, avoiding as far as possible technical terms. It is a difficult matter to overcome the prejudices of some persons in rural places, and to convince them that they need instruction in the management of their gardens or allotments. The subjects for the present course are, "Advantages of Cottage Gardens and Allotments," "Apples and Pears for Profit and Home Use," "Profitable Fruit Culture," "Useful Vegetables." My plan is to point out by practical illustrations what to avoid and what to do. I find that, for future guidance, persons like to know the wrong way as well as the right to follow, to achieve the best results.

"The most important point is to teach the right methods of cultivation, mainly with a view to provide a full home supply of vegetables and fruit, rather than to attempt to teach how to make a fortune from a small plot of land, which of course is quite out of the bounds of possibility. Such ideas do more to imbue the listeners with scepticism than ought else. I also find that the mere reading of a paper is not sufficient to enlist the attention of an audience. Something more is needed to give interest to those who are in almost total ignorance of how to manage a garden, however small. In all rural districts, there are strictly local methods of dealing with the manner of cropping, pruning trees, and so on, which a stranger would find some difficulty in understanding.

"The thorough preparation of the soil—such as trenching, for instance—is but imperfectly understood, and the reasons for so doing, and the results of good and bad methods, are not well understood. Much ignorance is displayed regarding the procuring, planting, and after-management of fruit trees, especially Apples. As a rule, the sorts are ill-chosen, no regard being paid to the selection of those sorts which will succeed in certain soils. The kind of tree bought is, as a rule, anything but the best. Cheapness is a point which receives far more attention than it should, as it is a well-known fact that cheap things are often the dearest in the end. Some growers of fruit trees appear to cater specially for this class of customers, selling trees at 9d. and 1s. each, which are simply maidens allowed to grow the second year without any cutting down, simply topping them; the result is, in many cases, a tree 4 to 5 feet high, with just a few shoots near the top (a mere apology for a bush). These, if planted in an exposed position, are in a sore plight after a strong south-westerly wind has swept the bulk of the fruit off. Then the trees are indifferently planted, often a mere hole is dug out, the roots crammed in anyhow, much too deeply, and as for mulching that is a point never heard of. Of course, it is understood that I am now alluding to persons in a general way—there are exceptions even in this; some men have gleaned knowledge, and strive to put it into practice. The lecturers would do well to find out, and point out to the audience, all such discrepancies as here named, making himself acquainted with the nature of the soil in the neighbourhood if possible, then to illustrate either by the aid of diagrams, or by the actual bushes and trees, how to properly plant, prune, and manage the trees afterwards. No matter how clearly the methods to be adopted are explained, if ocular demonstration is given the subject is fixed much deeper in the mind of the listener; for instance, in treating upon Apple culture, both as standards and bushes, my plan has been to provide an illustration and bush tree, which is easily done. Abundance of wild Cherries grow in the woods here; the young growths are capital representations of standards. I point out the importance of early staking newly-planted trees of the last-named, and not only tell them how to stake them on the most approved principle, but demonstrate the operation on the platform.

I am aware there are varied opinions as to the advisability of non-pruning over pruning the first year. I have heard them expressed pretty freely among the audience. I always provide for any argument of this kind by carrying with me sample branches or shoots from pruned, unpruned, or simply topped shoots, which demonstrate clearly to any who has a doubt as to the system adopted. Such proofs as these cannot fail to give satisfaction. Then, again, in pruning established trees, where space will allow, I advocate extension of growth in preference to root-pruning, laying especial stress upon the desirability of ample branch space, avoiding overcrowding. I generally commence by showing a shoot of last year's growth 2 feet long, the result of cutting back to within, say, 4 inches of the base for the past three years, for instance, without root-pruning. After explaining the error of such treatment, showing no prospect of fruit-spurs forming

on the previous year's growths left, I advise an extension principle of pruning in the place of root-pruning. One night a well-to-do amateur interrupted me by flatly contradicting the method I was explaining; he had no doubt managed his trees by judicious root-pruning, but when I produced afterwards specimens of shoots and branches showing the results of extension, these being thickly studded

of the persons they are intended for. Such a plan as this only leads to confusion in the minds of the audience. Some knowledge ought to be previously gleaned from the locality respecting this point, of the sorts which do succeed; improvements can then be sometimes made, and the lecturer places himself more in touch with his audience and by a far better chance of gaining their confidence. *Lecturer.*"

brought Gooseberry and Currant bushes and young fruit trees with him, and actually went through the process before their eyes, initiating them into the mysteries of stopping, spur-pruning, root-pruning, &c., in such a practical manner, that he must indeed have been a dullard who could not afterwards go and do likewise. Then, when on the subject of fruit trees, he had examples of the various sorts with him, such as standard, pyramid, espalier, cordon, &c., and showed the class the points to be observed in choosing a healthy tree, told them the most valuable sorts to grow, and how to plant, train, and treat them when obtained. The same plan was followed with regard to budding and grafting, a quantity of scions, stocks, &c., were brought, and the students not only saw the lecturer so deftly perform the operations himself, but they tried their 'prentice hands themselves, and after a few trials under supervision, accomplished them with a fair amount of dexterity.

"In preparing seed-beds, soil and seed were brought; in propagation by the various methods, e.g., by cuttings and layerings, &c., examples of each were taken off the parent plant before the students' eyes, and, in short, the same plan was followed, whether it was in allotment gardening, the subduing of pests, or any other subject taken during the course; everything that was of service in explanation was brought forward, and practice combined with theory in such a manner that everyone must learn.

"Now, is it to be considered that the money spent upon such classes as the foregoing, and reaching 131 students, is entirely wasted? Surely not. And when it is remembered that, by the East Suffolk Scheme every hole and corner of the county can be touched, and every one instructed that has a desire to be, I think that the money is as usefully spent as in making large grants to central institutions, which can at the most be attended by only a very small percentage of the population."

This being the sort of information that is given, let us see who were the instructors, and from what class of men they were taken. It is necessary to do this, as one of the objections raised was that there would be a dearth of competent teachers. This seemed likely enough, and no doubt some few would-be teachers found out that they were not fitted for their duties, or that they had taken a wrong view of the requirements of their auditory.

It will suffice to mention the names only of those who kindly communicated with us on the subject:—Messrs. A. Dean, R. Dean, Dutton, Fraser, D. T. Fish, Jordan, J. Knight, Luckhurst, Macmillan, Milsom, Molyneux, Palmer, Udale, Woodcock, and J. Wright.

We are sure that, taking one with another, no better set of instructors could have been found, and the mention of their names is sufficient to show that the apprehensions of those who feared the teachers would be incompetent, and would take erroneous views as to their duties, were happily not realised.

"What was the result of all this?" it may be asked. Of course, it is too soon to judge of the practical benefit that has or will ensue, but we have at least some means of forming an opinion on the subject—one by ascertaining the numbers that attended, and by noting the reception the lecturer met with; the other, by testing the result of the examinations.

The number that attended of course varied, according to locality, state of the weather, and other considerations, not forgetting the influenza, which was very prevalent at the time when the lectures were in progress. But, speaking generally, the attendance was very good, men coming often for several miles to be present. We have no record of a smaller attendance than 12 on any one occasion in any county; the next lowest is 20, the highest 120, and the general average throughout the country, 40 to 50. Of course,

This is what was said by the local Secretary of the East Suffolk Technical Instruction centre, regarding the class conducted by Mr. JORDAN, gardener to Rev. H. BERNERS, Harkstead Rectory, Ipswich:—

"But the class which was the most useful in a purely agricultural district, I consider to be that of horticulture, for the lessons in this subject were not lectures only, but practical demonstrations, e.g., when the lecturer treated of thinning and pruning, he not only told the students how to do it, but

FIG. 16.—*BOUGAINVILLEA SPECTABILIS* AT BANGALORE, GROWING OVER A *CASUARINA* TREE 40 FEET HIGH. (SEE P. 92.)

with fruit-buds, and the length of the annual growth perceptibly decreasing, the tree altogether rendered fertile without touching the roots, my critic collapsed. Of course, I always take care to explain that the roots must be kept near to the surface, especially in heavy soil by surface dressings rather than digging manure in deeply. Well-executed diagrams will, of course, illustrate the ideas of a lecturer equally well. It is a mistake for any lecturer to go into a strange neighborhood and give a long list of names of any kind of fruit or vegetable without knowing whether they are applicable to the soil or the requirements

these are rough enumerations, but they are precise enough to show that considerable interest was felt in the matter by the auditory. Often the lectures were invested with a little ceremonial—the County Councillor of the district, the rector, the squire, or other local magnate occupied the chair, regulated the subsequent discussion, and tendered a vote of thanks to the lecturer. Some of the lecturers wrote to us at the time in warm terms of the kindness and encouragement they received at the hands of the country gentlemen and others with whom they came into contact.

We have not much information as to the results of examinations. In East Suffolk, the prize was awarded at Hoxne to GEORGE ISMAY, and various other prizes and certificates were awarded at Metfield in the same county, where Mr. PLEASANT held a course of lectures. JAMES KERRISON obtained the first prize, and many others secured honours. At this examination (we are quoting from a local paper), one of the examiners, Mr. BRYANT, of Laxfield, spoke in high terms of the practical work done by the students, emphasising particularly budding and cleft grafting. One examination we are in a position to speak of from personal knowledge—the one conducted under the auspices of the Royal Horticultural Society for the Surrey County Council. This has already been alluded to in our columns. Its result was to show conclusively that instruction of an excellent character, well suited for its purpose, had been conveyed by the lecturers to a class of persons as a rule not reached by the gardening press, nor by any other means known to us.

Considering the novelty of the scheme, and the various obstacles in the way of carrying it out, we can but congratulate all concerned. They have not allowed themselves to be discouraged, but they have gone to work so earnestly and ably that they have laid an excellent foundation on which they and their successors will erect a superstructure that will be of the greatest service in the diffusion of useful horticultural knowledge in increasing the welfare of the community, and indirectly in raising the status of gardening and gardeners.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the above Society will be held in the Drill Hall, James Street, Victoria Street, S.W., on Tuesday, July 26. In addition to the ordinary exhibits, the National Carnation and Picotee Society will hold its annual show, in which the special prizes offered by Mr. MARTIN SMITH will be competed for. At 3 P.M., Mr. A. J. MANDA, of the United States Nurseries, Hextable, Swanley, will give a lecture on "Insect-eating Plants," in connection with which many exhibits are expected.

A HYBRID LILY, "FRANCIS FELL."—Mr. WARE, of Tottenham, sends us for examination a flower of a Lily raised by him by crossing *L. pardalinum* and *L. Parryi*, together with flowers of the parents for comparison. Great interest attaches to hybrid Lilies, as they are rare in Nature, and not yet common in gardens. In this particular instance also, the cross is interesting, as the two parents have marked characteristics, and although *L. pardalinum* presents numerous variations, yet none of them, so far as we know, is at all likely to be confounded with *L. Parryi*. Lily "Francis Fell, hort. Ware," has linear-lanceolate very acute leaves, like those of *L. Parryi*, the lower ones in whorls of nine, each leaf measuring about $3\frac{1}{2}$ by $\frac{1}{2}$ inch. The upper leaves are smaller, scattered, continued up the stem to the base of the inflorescence. Peduncles somewhat umbellate, longest about 4 inches long, erect, four or five times longer than the lanceolate bract.

Flowers horizontal or ascending, about 3 inches long, orange-coloured, flask-shaped at the base, contracted about the middle, bell-shaped in the upper third segments, linear lanceolate, orange-coloured, and with a prominent midrib externally, internally of a brighter orange, with numerous small brownish spots. Filaments very slender, anthers protruding, deep brown, with very larger pollen grains. Ovary very slender. In *L. Parryi* the perianth segments are about one-fifth longer, pale yellow, with only a few spots at the base, and the small veins are, in the specimen before us, remarkably sinuous, much more so than in *pardalinum*, or in the hybrid. Whether this is merely accidental or no we cannot tell. It is to be noted that the peduncles of *L. Parryi* of Mr. WARE'S plant are very much longer than they are represented in the plate in Mr. ELVES' *Monograph*, but that was taken, he tells us, from a dried specimen. The specimen of *pardalinum* sent us by Mr. WARE, appears to us to be the variety *angustifolium*.

UNDER THE BLOSSOM.—Mr. F. W. BORDIDGE contributes to the current number of *Good Words* a paper entitled "Under the Blossom," which treats in popular language of the fertilisation of flowers, and the relations between plants and insects. There are several sketches of members of the natural order Rosaceæ, which should beguile the unscientific reader into improving his mind by reading the article which they illustrate.

NATIONAL CARNATION AND PICOTEE SOCIETY.—The sixteenth annual exhibition of the southern section of the above Society will be held in the Drill Hall of the London Scottish Volunteers, James Street, Westminster, on Tuesday, July 26. Seventy-four prizes are offered in sixteen classes. Special prizes are also offered for border Carnations by MARTIN R. SMITH, Esq. The exhibition will be open to visitors at 1 P.M. A luncheon is provided at the Hotel Windsor, adjoining the Hall, at 1.30 P.M., for members and their friends. Tickets are 2s. 6d. each. The *Carnation Manual*, which has been in preparation for some time, is nearly ready, and will be published by CASSELL & Co., Limited, about the first week in August.

BOTANICAL NOMENCLATURE.—We have received from Berlin the following propositions for an amendment of the "Lois de Nomenclature Botanique":—"Since the time of LINNÆUS, botanists have continually endeavoured to gain a uniform nomenclature, and these endeavours have been completely justified on account of an easier mutual understanding. We know very well that certain differences will always remain, because the decision on some questions only depends on the author's subjective opinion. But we hope that a gradual and continual reformation will result in an essential improvement. O. KUNTZE'S *Revisio Generum* has raised an evident perturbation, and will cause a complete confusion; we have therefore thought it necessary to propose the following four resolutions, which refer only to genera:—

"1. The starting-point of the priority of genera as well as species is the year 1752, resp. 1753.

"2. *Nomina nudum et seminuda* are to be rejected. Pictures [illustrations] alone without diagnoses do not claim any priority for a genus.

"3. Similar names are to be conserved, if they differ by ever so little in the last syllable; if they only differ in the mode of spelling, the newer one must fall.

"4. The names of the following larger or universally known genera [appended, but not here reprinted] are to be conserved, though after the strictest rules of priority they must be rejected; in many of them the change of the names now used is by no means sufficiently proved.

"The Committee: P. ASCHERSON, A. ENGLER, K. SCHUMANN, I. URBAN."

We do not suppose that there will be any great difference of opinion as to the last three proposals; but as to the first, it must be remembered that the authors of the *Genera Plantarum* (BENTHAM and HOOKER), adopt as their starting-point for genera, LINNÆUS' *Genera Plantarum*, published in 1737. If we mistake not, in the vast Kew Index now in preparation, the same date is adopted. Now, as these two works are

already practically completed, and are likely to be the standard for working botanists for many years to come, it is preferable to follow the same plan rather than set up another. The whole matter is one of convenience, not of science, nor of ethics. Neither convenience, however, nor science, will be promoted by variation of usage in the great botanical centres.

"**ICONOGRAPHIA FLORÆ JAPONICÆ.**"—This work, otherwise entitled *Descriptions with Figures of Plants indigenous to Japan*, is edited by Dr. KYOKICHI YATABE, and published in Tokyo by Z. P. MARUYA & Co. It contains excellent lithographic illustrations with botanical details, while the text is rendered both in English and Japanese. It will be indispensable to all botanists interested in the Japanese flora, and as so many garden plants are derived from Japan, it should be included in all good garden libraries.

POTATO DISEASE.—The report published by the Board of Agriculture on recent experiments in checking Potato disease (EYRE & SPORTSWOOD) is a useful summary of what has been done by the Royal Agricultural Society, and by private individuals, to test the value of the copper treatment of mildewed Potatoes. Another year's trial at least, it is evident, must be made in different parts of the country, and greater care taken to secure a solution of the right strength, and that it shall be applied at the right season. The Jensen system is here and there alluded to, but no mention is made of the remarkable experiments carried out at Chiswick. "The proper method of making the Bordeaux Mixture is to hang the sulphate of copper in a coarse bag in cold water in a tub or other vessel [wooden or earthenware, not metal], and allow it to melt gradually. The quick-lime is put into another vessel, and slaked by degrees. The milky liquid should then be poured through a sieve into the sulphate of copper solution, and the whole well stirred." The sulphate of copper must be pure, the lime also should be of good quality, and the resultant fluid beautifully blue. A 2-per-cent. solution—that is, 20 lb. of copper sulphate, and 10 lb. of lime, to 100 gallons of water—is about the right proportion, but the appropriate strength varies with the variety of Potato, the character of the season, &c.

ZURICH.—Dr. HANS SCHINZ has been appointed Professor of Systematic Botany in the University of Zurich. Dr. SCHINZ has travelled in South Africa, and is well known for his researches into the botany of that country.

BRAUNSBURG.—Dr. NIDENZU, of the Berlin Herbarium, has recently been appointed Professor at Braunsberg.

POISON IN TINNED PEAS.—Attention has recently been called to the way in which the poor people are poisoned by the bright green Peas and pickles which adorn some of the grocer's shops in our large towns. From some proceedings which took place at Liverpool a few days since, it would appear that the preserved Peas which the poor consume with so much relish are injurious, owing to the sulphate of copper that is present in them. A Liverpool grocer was fined for selling a one-pound tin of Peas, which contained as much as two and a-half grains of this poison. The medical evidence was both startling and interesting. One doctor testified that not only had this dangerous chemical coloured the skin of the Peas, but it had penetrated the Pea itself. Peas treated with sulphur became green in half-an-hour. The borough analyst said that the evil arose from the astringent effect produced by the sulphate, which resembled that caused by alum when present in bread. It is suggested that the municipal authorities should grapple with more vigour the matters of this kind as they appear to possess the power so to do. It is an old practice, which the parochial analysts might do much to prevent.

THE PICOTEE AND THE CARNATION will soon, in Southern England, have about reached their greatest perfection for the present year, a fact which was

quite evident on the occasion of a recent visit to the very nice collection of these favourites to be found at Messrs. VERRICH & SON'S Nursery, Chelsea. Picotees, both red and purple edges, do very well as treated there, and they seemed to have withstood wind and heavy rain even better than their reputed hardier relations, the Carnations. Of the former, Dr. Epps, one of the best of the heavy red-edged varieties; Liddington Favourite, the finest wire-edged variety of the same section; J. B. Bryant, red heavy-edged variety, were in excellent form and preservation. The popular varieties Mrs. Sharp and Mrs. D'Ombrain were likewise very nice, and furnished the best reasons for their popularity. Mrs. May is a Picotee with a rosy-purple edge. It is very dwarf—a matter of some moment with certain growers. Of the same class is Clara Penson, one equally in request with those; and also Mary, a pretty thing. Flaked Carnations come more and more to the fore, Bizarres retiring in a proportionate degree; but the popular fancy just now leans most towards those varieties which the florist names fancies; that is those flowers that do not range themselves under what may be called the primaries, which are crimson, yellow, scarlet, rose, and white; hence fawns, salmon-reds, slaty crimsons, and a few other not easily-described tints have to be kept in stock in considerable numbers. However, good distinct colours in self find numerous admirers, such varieties are the Imperial Purple, Cara Roma (Turner), of good form and slightly fragrant; Queen of Bedders (Turner) a bright free-flowering variety, useful for cutting, and the habit is good; Ruby is like the last-named, but it is a smaller bloom; the habit is good, and the plant does well—at Chelsea; Germania, for which a great demand exists, does splendidly there, both indoors and out; Mr. Gifford's seedlings, viz., Mrs. Gifford, after the style of Gloire de Nancy; Amy Herbert, cerise pink, not very full, a robust grower; Leander resembling Germania, but standing rain better than that variety; and Montague, a flower of a bright shade of scarlet, but not possessing such substance in the petals as some of the older varieties of the same shade of colour. Crimson Pet is a beautiful deep crimson Carnation, not large, but of good quality. Border Maid is a perpetual blush-coloured self, running out to white at the edge of the flower, dwarf in habit, and growing well. Winter Cheer every one knows. It is a very bright scarlet, very dwarf, even when grown under glass, where it seldom reaches 2 feet in height; out-of-doors it will flower up to September. Frank Watts is rather taller than the last-named, and is a white, full flower. Among white-flowered varieties we noted Mrs. Donaldson, W. P. Milner, and The Bride. One of the best red Carnations is Magnum Bonum; it will succeed out-of-doors, is dwarf and floriferous, and the grass is abundant. Others noted were Joe Willett, a bright scarlet; Beauty of Foxhall, a variety that was fast disappearing, but which is now being taken in hand, and increased; it has the nicest of purple shades; W. Toby, a very dark sport from Lord Beaconsfield; Brilliant, an old variety, this year dwarfer than usual; Dr. Park, a good grower, rose-pink in hue, very free and fragrant. These, with Lothair, Celia, Alice, Agnes, Thalia—a fine flaked Carnation, and Colonial Beauty, comprise the pick of the beds at Chelsea.

PHOTOGRAPHING THE MOVEMENTS OF PLANTS.—By means of an ingenious contrivance described by MM. DERVÈRE and BORDAGE in the *Rev. Gén. de Botanique*, 1892, p. 65, it is now possible to make photographic observations on the movements of the growing parts of plants. These scientists have obtained some especially interesting results in examining climbing plants, e.g., *Humulus Lupulus*, *Ipomœa purpurea*, *Convolvulus sepium*. They find that the nutation of the young stem consists of a succession of irregular circular or elliptical curves which vary every moment, even in their direction, and which are caused by unequal growth in different parts of the stem. Distinct Heliotropism was discovered in the case of *Ipomœa purpurea*.

Observations were made of a similar character in the case of roots grown in water and "aërial" roots, the latter being illustrated by the Orchideæ, Aroideæ and Bignoniaceæ. The sleep-movements of leaves may be examined in the same way. These movements appear to be by no means uninterrupted movements, but to consist of alternate upward and downward movements, the oscillation becoming less in amplitude, and of greater frequency as they progress.

SPECIES OF THE ROSE.—The following species of Roses were shown by the Director of Kew Gardens at the Drill Hall, Westminster, on July 12, 1892. The exhibit was of the most interesting and instructive character. It is to be regretted that someone conversant with the subject was not told off to speak on the subject:—

Rosa agrestis (sepium)	Rosa lucida
" alpina var. inermis	" fl. plena
" anemoneflora	" macrophylla
" arvensis var. capreolata	" microcarpa
" .. fl. plena	" microphylla, fruits of
" Beggeriana	" moschata (R. Brunonii)
" beigradiensis	" mundi
" blanda	" nitida var.
" canina	" nivea
" californica	" Noisettiana
" carolina	" Nutkana
" centifolia and vars.	" pisiformis
" cinnamomea	" Pisardi
" damascena	" provincialis
" gallica and vars.	" rugosa
" var. byzantica	" .. var. alba
" hibernica	" .. fl. plena
" indica	" sempervirens
" .. var. cannabifolia	" tomentosa
" mou-trosa (Rose verte)	" .. var. nivea
	" versicolor

All of these were in flower except R. microphylla, which was sent to show its curious fruits.

COPPER DRESSING IN THE TREATMENT OF FUNGOID DISEASES OF PLANTS.—Perhaps the greatest difficulty in the successful treatment of such diseases as the "Potato-blight" and mildew of Vines, is the action of heavy rains, which dissolve and wash away the dressings before they have had time to take effect. It is under these circumstances well to know what remedies are the most resistant and what the most ineffectual. The most easily displaced amongst the various preparations which have been used in combating the Potato disease is, according to Mons. Aimi GIRARD (vide *Bulletin de la Société d'Encouragement pour l'Industrie Nationale*), the well-known "Bordeaux broth," i.e., that composition which is composed of the following ingredients:—

Copper sulphate...	2 kilos.
Slacked lime (weighed as quicklime) ...	2 kilos.
Water ...	100 litres

The most resistant solutions that have hitherto been employed are the so-called "Burgundian broth," "Perret's solution," and the Montpellier mixture; these are composed of the following ingredients:—

<i>Burgundian Broth.</i>	
Copper sulphate...	2 kilos.
Soda crystals ...	3 kilos.
Water ...	100 litres
<i>Perret's Solution.</i>	
Copper sulphate ...	2 kilos.
Lime ...	2 kilos.
Troncle ...	2 kilos.
Water ...	100 litres
<i>Montpellier Mixture.</i>	
Verdigris ...	1 kilo. 6 grammes.
Water ...	100 litres.

Our readers should make a note of these last three solutions.

SOME NEW OBSERVATIONS ON MUSCINEÆ.—If mosses are cultivated in the air or in water, and the conditions of illumination and of the position of the stem are varied, the stems are seen to be endowed with very fully negative geotropic, and with strong positive heliotropic properties. The heliotropism is always preponderant, and the stems always direct their growth towards the source of light, whatever its direction. In a moist air the leaves of certain mosses take two positions on the stem; one when the air is nearly saturated with moisture, the other when the air is comparatively dry; the latter is the closed position, or that of sleep. The movements of one of their positions to the other depend on the contraction or turgor of its chlorophyll tissues. In both states of the leaf

mosses disengage carbon dioxide in the dark, but the process is less active in the sleep condition; and this is also true of the process of assimilation. The relation of the volume of carbon dioxide disengaged to that of oxygen absorbed is constant and normal. It is in the spring and autumn when mosses are moistest that their vital functions are most active, and that the sexual organs are formed. [*Rev. Gén. de Bot.* (Bonnier) iii., pp. 255, &c.]

FLOWER FORMATION.—Professor SACHS' theory that the substances which go to the formation of the flower are already formed in the green leaves, receives support from a fresh series of experiments recently carried out by him in the case of buds formed on the leaves of the Begonia. From these experiments he concludes that the materials which take part in the formation of the flowers are present in the leaves in the summer, but not in the early spring. For further details, and for other interesting information upon the period of the formation of the flower, consult the *Rev. Gén. de Botanique*, p. 18, 1892.

ENTOMOLOGY.—The reports of the Division of Entomology of the U.S. Department of Agriculture for 1891 contains some valuable information relating to scale insects of various kinds. The fluted scale, *Icerya Purchasi*, has been kept in check in California by "lady-birds" (*Vedalia cardinalis*), imported from California for the purpose, so that the friendly character of these little beetles is now well established.

LEWIS A. LEE.—Few appreciate the value of a magazine. Let us illustrate by the old *Gardener's Monthly*. In September, 1869, it announced the discovery by a Chicago gardener, LEWIS LEE, that Paris Green was a sure protection against the ravages of the Colorado Potato beetle. It is safe to say that millions of dollars have been saved to our country by this discovery. Had Mr. LEE been a Frenchman, his government would have adorned him with crosses, and he would have been placed on a par with Parmentier, who made the first Potato popular. Chicago should look him up, and do him some honour yet if living. He ought to be one of the lions of the exhibition, says *Meehan's Monthly*, Philadelphia.

NEBRASKA.—The annual report of the State Horticultural Society for the year 1891 contains in addition to matters of purely local interest, articles which are of value to cultivators in all parts of the world, as, for instance, the Entomologists' Report by Professor BRUNER, and the botanical articles of Professor BESSEY. Of the special rules for nomenclature and judging we have already spoken. If in some districts there is a fear that noble and priceless forests will be destroyed by reckless felling and other causes, it is satisfactory to find that, in the prairies a great deal of planting is being done. In one part of Nebraska, as late as 1872, a region of treeless plains, there are nearly 5000 acres of cultivated timber, and more is being planted each year. Mr. A. J. BROWN, speaking of the results obtained, says, "Plant freely of the better sorts; give good care and thorough cultivation for a few years, and great will be your reward."

DOES GIRDLING NECESSARILY KILL A TREE IN A SHORT TIME?—According to American exchanges, this question must be answered in the negative. Professor MEEHAN, in his *Monthly*, figures and describes a case of the white Pine, in which the upper part of the branch above the denuded portion has grown for at least six years, whilst the lower part has not increased in size. This looks as if the leaves and young bark absorbed moisture from the atmosphere sufficient to enable the shoot to dispense for a time with root-supplies. We are assuming that the girdling has been so efficiently done as to cut off all communication with the root.

DEVIZES BENEVOLENT SOCIETY.—The annual exhibition of Chrysanthemums, Primulas, Cyclamens, &c., which is held in connection with a bazaar in support of the above Society, will take place in the Corn Exchange, Devizes, on Tuesday,

November 8. Probably at no other exhibition held in the West of England can better trained specimen plants be seen than that at Devizes; while the table of baskets of hardy autumn foliage is a delightful exhibition in itself.

BEDDINGTON, CARSHALTON, AND WALLINGTON HORTICULTURAL SOCIETY.—A Conference, under the auspices of the Surrey County Council, will be held on Monday, August 1, at 4 o'clock, when short lectures will be given by the judges (Mr. JOHN WRIGHT and Mr. GEORGE GORDON) on cottage gardens and allotments, with special reference to those inspected, in which strong and weak points in culture will be pointed out, and suggestions made for future action. The County Council has also appointed Mr. ALEXANDER DEAN and Mr. EDWARD LUCKHURST for short lectures, and will provide any diagrams or models that may be necessary. The committee of the Society have made arrangements to have a flower stall for the sale of cut flowers, fruit, &c., in connection with the show, the proceeds to be devoted to the Gardeners' Orphan Fund.

ROSE AND HORTICULTURAL SHOWS.—Moseley (Birmingham) Rose Show was held on Tuesday and Wednesday last, the 19th and 20th inst., in what is known as the Moseley Botanical Gardens and College Grounds, which is an important addition to the places of public resort in Birmingham. The show was a very good one, and in the class for seventy-two distinct, single trusses, there was a keen fight between Mr. F. CANT and Mr. B. R. CANT, both of Colchester; by a few points, Mr. F. CANT was eventually awarded 1st position. The Portsmouth Horticultural was held in the Victoria Park on the 13th, 14th, and 15th, and was a thorough success. Horleston Horticultural was held on July 14; and on the 19th inst., the annual show took place at Bray, "the Brighton of Ireland." We have received reports of all these exhibitions, but regret from want of space, we are able only to refer to them in the briefest manner possible.

BALSAMS AT CHISWICK.—A very excellent batch of Balsams are now in bloom in the Paxton-house of the Royal Horticultural Society at Chiswick. They are in 24's, and are producing a wonderful amount of large and extra-double flowers.

BRIGHTON AND SUSSEX NEW HORTICULTURAL AND MUTUAL IMPROVEMENT SOCIETY.—At a meeting of the above society a letter from the committee of the Chrysanthemum Society was read, to the effect that that society was in favour of the amalgamation of the two societies at the end of the financial year, and it was resolved that the first joint committee should be held on the 21st inst. to discuss details. Fifteen new members were elected, and the general proceedings and the various interesting exhibits show that the horticulturists of Brighton are sensible of the advantages to be gained by mutual improvement.

HOME CORRESPONDENCE.

JAMES VEITCH STRAWBERRY UNDER FRUIT TREES.—Accident has revealed the fact that James Veitch Strawberry is capable of producing heavy crops of rich fruit on ground underneath fruit trees, in the following manner:—About five years since, some Strawberry plants which had been forced were planted in a row at the south end of a small piece of land on which had been planted two or three years previously some pyramid fruit trees on dwarfing stocks for permanent fruiting. Among several other varieties in the row were two or three plants of James Veitch. All the sorts did fairly well, but after two or three years it was found that the James Veitch were overrunning and driving out the others. Very little time could be spared to keep the land under the pyramid fruit trees clean, and consequently runners from the Strawberry row roamed at will all over it. The plants now under the trees are all found to be of the James Veitch variety, and many of their leaf-stalks measure 15 inches long. Fruit of excellent quality is now (July 11) ripening fast, even in places

where direct sunshine can hardly at all if ever find its way; the berries are not highly coloured, and are somewhat too soft for market purposes; but the latter characteristic is one which appertains to this variety even when grown in more open positions. The flavour is most excellent. The land, which these Strawberries cover close up to the fruit-tree stems, has been exceptionally well done in the matter of manure; but I doubt if there is any other sort which would ripen fruit of good quality in dense shade under the drip of fruit trees, no matter what manure had been applied. This land was deeply dug between the trees for the first few years after the latter were planted, care being taken not to go close enough to damage the roots, and crops of vegetables were taken off it. Heavy dressings of earth-closet manure were applied each winter during this time. Every winter since the trees were planted, one or more soakings of sewage have been given, and during the winter just past, in addition, a very heavy coat of cow-yard dung was applied and spread over the surface and left, without notice or care being taken of the Strawberries; the prunings of the trees have been left on the ground to rot with the leaves for several years. The Pears are splendidly handsome and healthy-looking trees, and flower profusely every year, but for some reason or other are not satisfactory; only once in eight years have they borne a really heavy crop, and then the fruit did not keep well. Plums occasionally bear tremendously, and at other times, as this year, the crop gets destroyed by spring frosts happening when the trees are in flower. Apples, however, are thoroughly at home, and there is always a crop; this year it is exceptionally heavy, and the fruit is well scattered over every part of the trees, showing how advisable it is to admit sun and air to every part of an Apple-tree. These trees have had their branches well thinned out, so that they cannot unduly shade one another, the consequence is that fruit buds form all over the tree, instead of only outside at the extremity of the branches where it is so liable to be blown off when heavy winds prevail. Apples were gathered for cooking purposes off some of these trees on June 29. Lord Sullield, Lord Grosvenor, Potts' Seedling, Ecklinville Seedling, and others have already good sized fruit on them. *J. E. Fwing, Havant.*

BERBERIS DARWINII AS A HEDGE PLANT.—It may not be generally known that this Barberry makes a capital hedge plant. We have some hedges of it here (Swanmore Park, Hants), on each side of a grass path 70 yards long, which were planted fourteen years ago, and they are very pretty when the plants are covered with their bright orange-coloured flowers, which are followed with berries of the same colour as Sloes. Thinking it might not prove thoroughly hardy, we at planting time put in one common Holly to every two of the Berberis, thinking the former would act as a protection to the latter in severe winters, and right well has the plan answered, as, until the last two years, none of the plants suffered in the least; but two have died since, while a branch or so of another shed its leaves during last winter; but as *B. Darwinii* is a quick grower, often sending up strong growths from the base, any gaps that may occur will soon be made good again. The hedge is now 5 feet 6 inches high, and about 15 inches broad, with perpendicular sides and flat at the top. It is a hedge that is easily kept, being amenable to clipping, which is done two or three times in a season, if excessive neatness is a point of study. The point to bear in mind is not to cut off the flower shoots and spikes until the flowering season—the middle of the month of April to the same period in the following month. It flowers again, sometimes, in the autumn. It will be understood that not quite so much flower can be seen on a hedge of it when clipped, as would be the case with plants unpruned; but as an evergreen hedge plant, it is alike suitable and uncommon. *E. M.*

PEACHES, WATERLOO AND ALEXANDER.—Both these were ripe on the open walls on the 16th of July. They are this season very fine, and if gathered a little under ripe and kept in an airy place a few days, the flavour is very fair. The trees should never be over-cropped, one large fruit being better than two small ones. *H. Markham.*

MARKETING FLOWERS.—In reply to the letter of "Rector" in your last week's paper in reference to the sale of cut flowers in Birmingham, we should like to say that much of his disappointment is the result of want of experience; for instance, what man of knowledge of the flower trade would send to market such flowers as white Snapdragon, red Snap-

dragon, white Rockets, rock Roses, Escallonia, Ribbon grass, single Pelargoniums, Sweet William, Honeysuckle, Day Lilies, Canterbury Bells, and Pansies, unless they were in bloom in February or March, as they would not pay their carriage fare to any market in England. Only imagine the state of Cistus and single-flowered Pelargoniums after a short journey. We can only add that if the Roses had been sent well packed to any respectable and established flower salesman at the times appointed for their sales, "Rector" would certainly have obtained fair value for his flowers, which at all times is variable, and greatly subject to the influx of large quantities from France, the Scilly Islands, and the overflow of the London market, which sometimes nearly deluges our market. However, there are growers, and they on the increase, who continue to send, and are content with the fluctuations of the auction sales. *Pope & Sons, Floral Auctioneers, &c., Birmingham.*

CHERRY, FROGMORE BIGARREAU.—This is a very useful early dessert Cherry, and is fit for use soon after that valuable Rivers' Early. The fruits are of pale amber, with a bright flush of red on the upper side, the flesh is sweet when gathered at the right time, but if left on the trees too long they become somewhat watery. It is notwithstanding a most valuable early fruit, and well deserves a place in every collection. It is a heavy cropper, and the individual fruits are large and handsome. Black Tartarian ripens its large black and delicious fruits in close succession to the first named, and is altogether a truly fine sort, while Kentish Bigarreau and Napoleon Bigarreau are both excellent, the latter having a long time in good condition. Both are sure and lasting croppers; the fruits are large and especially fine on walls. Napoleon being a darker red and firmer flesh. *H. Markham.*

PLANTS FOR WINTER AND SPRING FLOWERING.

DURING the summer season, while flowers abound in such profusion, many, except the oldest and most experienced gardeners, are apt to leave this important question until too late in the season for proper justice to be done to it. It is of little use to propagate a good supply of plants for winter flowering, unless they receive the requisite attention throughout the whole summer and autumn. I have known more than one instance where a person has been stimulated into making grand preparations for a showy and useful display in his conservatory during the ensuing winter, simply because he saw one or two subjects well done in a neighbour's garden. The sight of good examples of any suitable winter-flowering plants naturally induces all lovers of flowers to attempt a similar supply, but too often, as the busy time of late spring and early summer comes round, such subjects have been somewhat neglected, with the inevitable result that the show of winter flowers is little if any improvement upon previous years. No neglect during summer and autumn should be allowed to affect any plants intended to produce flowers during the dull days of winter, and when they must perforce be under artificial treatment. Indeed, I may say that the chief secret of a good winter supply is careful attention at the present time.

Much of the propagation should have been done before this, but there are still several very useful subjects that may be prepared between the present time and the early part of November, when winter-blooming plants may be said to commence the most useful part of their existence.

Small pots are by far the best in which to grow the majority of flowering subjects, and this more particularly applies to those intended for winter cultivation, as in that case small and well-matured plants result, and the closer confinement of their roots is conducive to a better supply of bloom. Small pot-bound plants may also be more beneficially assisted by applications of weak manure-water. This cannot be given with the same good results if the soil is not thoroughly permeated with roots; liquid-manure being deleterious instead of beneficial under such conditions, as it is apt to make the soil stagnant and sour.

Poinsettias are far better if grown under much

cooler treatment than they generally receive, and at the present time will do very well without the aid of artificial heat. They grow more slowly, retaining their foliage much better when removed to warmer houses in the late autumn. This should always be done before the colder nights have affected them in any way; at the same time, care should be taken not to introduce these, and *Euphorbia Jacquiniflora*, into too strong a heat. An advance of 10° from their autumn quarters in some deep pit or frame will be ample; too often these are placed into a stove temperature at once, and the result is not nearly so satisfactory as if a cooler treatment had been afforded them until the bracts and flowers were showing more prominently.

Then there are the zonal *Pelargoniums*, *Abutilons*, *Echeverias*, winter-flowering *Begonias*, *Azaleas*, *Ericas*, *Clerodendrons*, and numerous other subjects, all of which require special attention at the present time if good and free-flowering specimens are to be had during the winter. To give even a brief outline of the treatment suitable to the various winter-flowering subjects, would take up far more space than the limits of my paper can afford, and I trust that these few remarks may serve their purpose in reminding my readers of the great importance of a careful summer and autumn cultivation.

Abutilons, zonal *Pelargoniums*, *Oleanders*, and many others, will respond very quickly to a rise of a few degrees in the temperature at any time a more abundant supply of flowers may be wanted; indeed, I think that the two first-named are still among the most useful of all winter-flowering plants, and the great diversity of their forms and colours, together with their freedom from diseases and insect pests, renders them particularly suitable for amateur cultivators. Both of these are ever-blooming; but if kept from flowering during the present time, and frequently headed to secure numerous points of growth, they are certain to repay you for such slight attention. *A. P.*

THE CEDARS, HARROW WEALD.

THE gardens of T. F. Blackwell, Esq., under the management of Mr. J. Dinsmore, gives a noteworthy example of what is commonly called all-round gardening, and one in which the interests of any department is not allowed to encroach unduly on the others. Since the erection of fine ranges of vineries and plant-houses over two years ago by Mr. James Gray, of Danvers Street, Chelsea, S.W., and which have proved eminently successful, Mr. Dinsmore has had more scope to display his abilities as a plantsman and fruit-grower, and well has he availed himself of the better accommodation provided.

In the stove-houses in which *Orchids* are grown, mingled with foliage and flowering plants, there is a show of *Cattleya Gaskelliana*; some good varieties of *Miltonia Roezlii*, an elegant specimen of the old *Brassia verrucosa*, with ten spikes; some good *Epidendrum vitellinum mejus*, with *Acineta Barkerii*, *Dendrobium Pierardi*, and other species suspended overhead; while the showy flowers of *Allamandas* and *Dipladenias* on the roof, and the bright foliage of *Dracenas* and *Crotons*, mingled with *Palms* and flowering plants of *Gardenias*, *Anthuriums*, *Tabernaemontana coronaria flore-pleno*, &c., form a suitable setting to the showier flowers of the *Orchids*.

In the new range of plant-houses, plants for conservatory, indoor and table decoration, are chiefly grown, and among them the *Begonias* and *Gloxinias* are especially well grown.

In these houses, too, a manner of growing *Dracenas*, *Crotons*, and other plants useful for decoration, and which require a good light, should be noted, as by these means the desired object is accomplished, and space made use of which would otherwise be void. These coloured-leaved table plants it is Mr. Dinsmore's practice, when they receive the shift into 48's, to suspend by wires in rows along the roof over the sides of the walk, and so placed and carefully looked after with respect to water, they form neat dwarf plants in which their respective

colours are highly developed, and which are said to withstand a sojourn in the dwelling-house or conservatory far better than those grown on the stages, and consequently at a much greater distance from the glass.

The conservatory, the stonework of which matches the style of the mansion, has a fine show of flowering plants, arranged with *Palms* and *Tree Ferns*. In front of the door stands a specimen of *Erica Cavendishii*, and on the side-stages are good examples of *E. Aitonii* and many other *Heaths*, with here and there a specimen *Clerodendron Balfourii*, some good *Anthuriums*, and well-grown *Achimenes*, &c. Outside the conservatory is the summer bedding-plant arrangement, brilliant and effective. In this the different colours of *Pelargoniums* play a leading part, and several beds of silver variegated *Pelargonium*, mixed with purple *Viola*, are telling features. Running past the Rosery is the long border of mixed herbaceous plants, biennials, and annuals, and the whole length of it is crowded with gay and fragrant flowers, such as *Delphiniums*, *Stocks*, *Pyrethrums*, *Mignonette*, &c. But the display of hardy flowers is not confined to this part of the garden, for, on the other side, is a cleverly-planned garden, in which all the showy hardy flowers, and especially those denominated "old-fashioned," are planted, with backings of effective shrubs. Among these the *Cypress* and *Juniper*, and the golden *Elder* and silver variegated *Maple* are very effective, and throughout the whole of the borders and beds which flank the tortuous walks, the rich colours of the fragrant *Roses*, the tall spikes of *Delphiniums* and *Hollyhocks*, the neat clumps of *Phloxes* and showy *Pæonies*, the *Antirrhinums*, *Pentstemons*, *Pincks*, *Sweet Williams*, *Campanulas*, the scented sprays of the *Honeysuckle*, the tall spikes of the *Foxgloves*, and innumerable other beautiful and favourite flowers appear in rich profusion.

The new range of vineries, not yet three years planted, have heavy crops of fine bunches. The progress of these *Vines* since they were first planted has been great, proving alike the good treatment and proper planting of the gardener, and that they liked the houses in which they are grown. The *Peach-houses* also are well-cropped, the *Melons*, *Cucumbers*, &c., in good condition, and the kitchen gardens well furnished, and kept in a neat and tidy manner.

FOREIGN CORRESPONDENCE.

NOTES FROM PROFESSOR SARGENT.

Boston.—The name of Professor C. S. Sargent is so intimately associated with trees and forestry that we seldom think of him as being the owner of one of the finest and most extensive private gardens in the country.

He is great on *Rhododendrons* and *Azaleas*, and every year in June endeavours to have large display of these as well as of *Indian Azaleas* in bloom together. Then he invites his friends to come and feast their eyes upon his pets.

His *Indian Azaleas* are now (middle of June) in splendid bloom, and arranged under a spacious conservatory-shaped canvas attached to his residence. Having them in bloom so late as this is caused by late growth, setting their flower-buds late, and wintering them in cool pits. On the verandah beside the *Azalea* tent were specimens of *Rhynchospermum* 7 to 8 feet high. "Plant them out in summer," said the professor, "that's the secret of success." *Bambusa aurea*, 12 feet high in tubs was also placed on the verandah, but because it is continually dropping its old leaves or scale bracts of the young growth, and making a mess, it is not regarded with much favour. *Wistarias* grown in tubs and trained as standards are used about the house when they are in bloom, and are liked very much.

Among the best of the outdoor *Rhododendrons* were *Lady Armstrong*, *Everestianum*, *Mrs. Milner*, *Charles Dickens*, *E. S. Rand*, *Lady Grey Egerton*, *Delicatissimum*, and *Alexander Dancer*. Along the

side of a walk at the back of his *Rhododendron* border, beside the pond, is a stone wall supporting a bank of earth, and this wall is completely hidden in a rank growth of *poison Ivy*. "Why do you have that villainous thing there, Professor?" I asked him. "Well, it's beautiful in the fall, when its leaves begin to turn," he answered. "Yes, it poisons me badly, too," he continued. Well, a man can do what he likes with his own; but my advice to you one and all is, erase every vestige of that vile plant from your property. Its presence is too great a price to pay for a streak of Nature's glow in our garden.

Syringa villosa, a very beautiful and late-blooming *Lilac* from Northern China, was in good bloom, or rather past its best. Professor S. tells me that the longer-known *Himalayan* plant known in gardens as *S. Emodi* is the same as, or at most a form of, *S. villosa*. Botanically this may be so, but horticulturally they are decidedly distinct, and *villosa* is the better one of the two by far.

Pointing to a handsome specimen of *Syringa japonica*, he remarked, "But that's the beauty." So it is, I admit, and the latest blooming; but where *Rose-bugs* are a plague, as they now are with us, we get no good from *Japonica's* flowers, as the panicles are alive with the vermin. These insects are more partial to the flowers of this section of *Lilacs*, namely, *Amurensis* (which is past) and *Pekinensis* and *Japonica* (both of which are now in bloom) than any other parts of any other plants with us.

The Professor is down upon *Retinosporas*, they are not reliably hardy. Well, they may be sour *Grapes* at Boston, but at *Glen Cove*, I can assure you we think they are pretty nice evergreens.

And he is severe upon *Japanese Maples*, that is, the polymorphous and *Japonicum* sections, because they die out so. He used to have lots of them, but they have dwindled down to two handsome specimens of crimson-leaved varieties. These *Maples* are, as far north as *New York*, I know, considerably affected by the *Japanese die-back* (we call it this because we know of no better name). A branch will die off this year, another next year, and so on unaccountably, and in summer as much as in winter. Dryness at the root particularly induces this evil. With good ground, abundant moisture summer and winter, protection from hot sunshine and bleak winds, one can grow these *Maples* well enough. If they are short-lived, by growing them low-branched, and elbowing the branches into the ground, we can keep on renewing and invigorating them, for they root quite readily from layers.

He has a very fine specimen of *Acer cissifolium*, a species seldom heard of. It makes a dense, broad-headed tree, 10 or 11 feet high, is in perfect health, and apparently perfectly happy with its lot at *Brookline*, and is seeding freely.

"The only unique tree I have got is that dwarf *Picea pungens* there," he said, pointing to a dense little plant, 2 or 3 feet high. It was one of the young plants raised from that lot of *Colorado* seed nearly thirty years ago, from which all the "first" fine blue specimens were raised.

He is getting solicitous about the value of the blue *Spruce* (*Picea pungens*) as a permanent garden plant, the indications are that it will lose its lower branches *à la Balsam Fir*. But, well treated, it will not do that under thirty years old, so I do not see the use of worrying much about it.

Syringa Alberti looked fine as a plant, and so it did too at the *Arboretum*, but when I ventured to suggest that it did not appear as if it had many blooms on it this year, I found I was treading on somebody's corns, for this little shrub is highly prized around *Boston*. Its rose-lilac flowers are really pretty, and delightfully fragrant; but, say what you will, it does not blossom very full every year. *Wm. Falconer*, in the "*American Florist*."

CALOCHORTUS VENUSTUS VESTA.

Haarlem.—Mr. C. G. van Tubergen, jun., *Zwanenburg*, *Haarlem*, writes, "I have much pleasure in again sending you a new type of *Calochortus*. Last autumn my collector sent me a number of bulbs of a

variety of *C. venustus*, which are now in bloom here, and as they are entirely distinct from the other forms in cultivation, they will be sent out under a separate name. It is proposed to call this beauty *C. venustus Vesta*. As you will see from the specimens forwarded to you, this new variety has no eye-like spots like the others, but it has a very richly-coloured band in the centre of the flower; it is also much the largest flowered of the whole *Mariposa* section. Judging from its vigorous growth and very free-blooming qualities, it promises much for the future, and will, I hope, help in more popularising this beautiful tribe of bulbs, which in good light soil can be grown as easily as Tulips, and which recent extensive importations have rendered much cheaper than they formerly were."

[The variety sent has flowers about 3 inches (8 cm.) across. The petals are flushed with pale lilac, externally, destitute, in the upper half, of the numerous small spots which form so conspicuous a feature in some of the varieties. The lower half of the inner surface of the petals is of a pale primrose hue, and marked in the centre with a deep crescentic or somewhat triangular blotch of chestnut-brown, with numerous minute spots and streaks of the same colour at the sides. Near the base is a crescentic corona, consisting of several rows of short brown threads, and beneath these the sharply-tapering stalk of the petal is marked with small purplish-brown blotches. When compared with other varieties, the most striking differences are the larger size of the flower, the absence of spots on the upper part of the outer surface of the petal, and the broad aureole of primrose colour, which instead of being confined to the centre, stretches across the whole of the lower half of the petal, and sets off the chestnut blotch and its attendant streaks. Ed.]

WEST INDIES.

THE UNITED STATES TROPICAL NURSERIES, TRINIDAD.

FOURTEEN miles by railway from the town of Port of Spain, and close to the Dabadie station, are situated the nurseries of the United States Tropical Nursery Company. The establishment forms a branch of the well-known and enterprising firm of Messrs. Siebrecht and Wadley, New York, U.S.A., and is under the management of Mr. H. W. C. Dihm.

Early in the present year, I had the pleasure of visiting this gentleman, and found him living in a complete paradise of Palms, *Dracænas*, *Ravenalas*, *Pandanads*, and thousands of other plants, all of which are cultivated for export to New York during the months of June, July, and August. The plants are, generally speaking, grown in pots, from thumbs to the 16-inch size; but beds, containing two or three thousand each, were planted out, to be again lifted, and potted hereafter as demand may arise.

For transit purposes, the firm has a contract with a line of steamers, who set apart a certain portion of their space for special storage. The plants are carefully packed on this side by Mr. Dihm, and I am told that each consignment is immediately taken over by the home firm on arrival at the port of New York, thus reducing risk of handling and bad treatment to a minimum. The average percentage of loss is very small. Among other plants, a few large Cocoanut Palms (*Cocos nucifera*) were successfully landed in New York in good condition last year. Flower pots and manures are returned by the firm by each steamer for the use of their Trinidad Nursery.

On the advice of Mr. Hart, who has taken a great interest in this enterprise, Mr. Dihm has built a small glasshouse for propagating purposes, and especially for the germination of seeds. This house is kept very close all the year round, little or no ventilation being allowed to the occupants of the house; in fact, treated in a similar manner as a propagating house in England during the summer season. In speaking of the germination of seeds,

Mr. Dihm informed me that he could "beat Nature by three months," meaning that if a seed was sown in the open ground at the same time that others were sown in the glass house, the latter would be fully three months in advance of the former which is a great advantage. That the plants raised in this artificial way are thrifty and strong is well shown by the excellent condition of those which had passed the ordeal, and been potted and placed in the open air. *Dracæna Goldieana* was represented by a few small plants, which do not appear to be much of a success. The same may be said of *Cocos Weddelliana*. *Dracænas* and *Asparagus plumosus* were being propagated from cuttings; and a few pans of Water Lilies, from seeds lately received from New York, were commencing to grow. A glass house of some description is indispensable in the tropics, for were it not for something of this kind, it would be quite impossible to raise many valuable seeds. So heavy are the tropical rains, that all seeds sown without covering are almost sure to be washed away. Like protection is also necessary for the successful growth of *Adiantum Farleyense*, and other tender Ferns, but for this purpose it must be understood that a completely closed house is not required; on the contrary, one where plenty of air can always be admitted, and one which can be readily shaded from the sun, is best suited to the purpose. In a well-drained bed were numerous seedlings of the best kinds of *Hippeastrum*, popularly known as *Amaryllis*. These were in fair condition, but the results of the experiment could not be accurately determined.

Palms are the principal plants grown at this nursery, followed in number by *Dracænas*. After the Palms are placed in pots from the seed-pans they are placed in permanent beds, where they are shaded with leaves of the Cocorite Palm (*Maximiliana caribæa*), raised on frames 8 feet above the ground, for protection against the sun. It is a somewhat difficult matter to procure these leaves, as this Palm, though once very plentiful, is fast disappearing, and a substitute will soon have to be found. A light wooden roof made of laths, say, 2 or 3 inches wide, and placed at a distance of 1 or 2 inches apart, to allow light to penetrate, might be suggested; and from an economic point of view, it would appear that by using such, a saving of labour might be effected. The beds under this shade are raised and sloped sufficiently to allow superfluous water to escape the walks and canals intersecting each other. The pots are partly plunged in the soil, which is of a very adhesive nature, with an opening scooped out underneath each pot by a trowel for the sake of drainage. First and foremost among the Palms is *Livistona chinensis* (*Latania borbonica*). This was present in all sizes, from 6 inches to 8 feet high in from 2 to 16-inch pots. This favourite is always in demand in New York, and is shipped by thousands during the summer months in all sizes, the larger specimens having an average of ten leaves each. Many plants of *Archontophoenix Cunninghamiana* (*Seaforthia elegans*), *Howea Forsteriana* (*Kentia Forsteriana*), *H. Belmoreana* (*K. Belmoreana*), *Rhapis flabelliformis*, *Phoenix sylvestris*, *P. rupicola*, *Stevensonsonia grandifolia* (*Phœnicophorium sechellarum*), and *Licuala peltata*, were noticed, and among small plants several hundred of *Chamaerops ignea* (so-called by the firm) were on their trial. *Thrinax radiata* (a native Palm of Trinidad), *Livistona altissima*?, *Chrysalidocarpus lutescens* (*Areca lutescens*), are grown in large numbers, especially *C. lutescens*. A few large tubs of this latter were noticed to be in excellent condition.

Unlike the Palms, *Dracænas* are planted out in beds fully exposed to the sun. These are grown for the New York establishment, where they are sold at so much per foot. They are usually exported in 18-inch lengths. The principal sorts grown are *D. ferrea*, *D. terminalis*, *D. terminalis alba*, *D. regina*, *D. stricta grandis*, *D. chelsoni*, *D. braziliensis*, *D. imperialis*, *D. metallica*, *D. bella*, *D. Shepherdii*, *D. fragrans*, *D. amabilis*, *D. Massangeana*, *D. Lindenii*, *D. congesta*, and *D. Norwoodiensis*. The latter appears to be the gem of the collection.

It is of a delicate character, but in appearance an exquisitely pretty plant. Its colouring is of a bronzy-red, edged with crimson-lake, and it shows out very distinctly among the various colours found in the other varieties. I have followed Messrs. Siebrecht and Wadley in adopting the word "*Dracæna*," as it is by this name the plants are commercially known, but most of them would be placed under *Cordylina* in a strictly botanical article.

In one of the avenues leading to the manager's house are several specimen Palms and Traveller's Trees (*Ravenala madagascariensis*), the latter having already matured seeds from which young plants had been raised, and, at the time of my visit, two more were flowering. In another avenue, parallel to the last, *Areca Catechu*, the Betel-nut Palm, were somewhat conspicuous. The road, however, is much too narrow for a carriage-drive, and the specimens are not seen to the greatest advantage. Planted out here and there are specimens of *Pandanus utilis*, a plant also exported by thousands in its small stages, with *P. Veitchii*, *Didymosperma distichum* (*Wallichia disticha*), *Cycas revoluta* and *C. circinalis*, *Stevensonsonia grandifolia*. *Rhapis flabelliformis* are grown both in pots and planted out, and the same may be said of *R. humilis*. *Aspidistra lurida variegata* is extensively grown, and *Alpinia vittata* in small quantities.

Mr. Dihm has formed a screen of climbing plants, to ward off the sun and glare from the front part of his house, which, apart from its pleasing aspect, helps to keep the interior cool during the heat of the day. *Piper nigrum* (Black Pepper), *Thunbergia laurifolia*, *Stephanotis floribunda*, and the golden-yellow flowered *Ipomœa pterodes* (a native of the colony), were all growing luxuriantly, and thriving in harmony one with the other. *W. E. Broadway, Trinidad, B. W. I.*

SOCIETIES.

CHESTER ROSE SHOW.

JULY 16.—The National Rose Society held their annual provincial Rose Show at this old town on this date, and although so far from the majority of rosarians who grow the queen of flowers for exhibition, there was a grand attendance of growers, and good quality was remarkable throughout the whole show. Unfortunately, it was a wet day, there being one incessant downpour all the morning and afternoon. This fact is the only reason for the public attendance being so meagre, as a greater feast of Roses was never provided in Chester. The entrance to the show-grounds, and also that leading into the exhibition tent were very sloppy and bad, and we could not help thinking that the management might have improved upon this somewhat in the way of straw, tan, or a little sawdust.

Judging commenced fully an hour and a half late; consequently, many holders of private-view tickets were in the tent while the judges were carrying out their functions. This evidently caused some little confusion, as it was quite impossible to turn ladies and gentlemen out into the wretched weather and dirt that prevailed all day.

The Jubilee Trophy was won by Mr. B. R. Cant, of Colchester; Mr. F. Cant, of the same town, followed very closely with Messrs. Harkness, of Bedale, Yorks, they being placed in the order named. This class was very strongly contested, the whole strength being evidently thrown into the contest, with the result that some eight or nine lots of perfect flowers were staged, and the judges had a very difficult task to decide upon the premier honours.

The class for seventy-two distinct varieties, single trusses, was also very strongly contested, Mr. B. R. Cant and Mr. F. Cant, of Colchester, being awarded 1st and 2nd respectively. The 3rd prize went to Messrs. Harkness, of Bedale, Yorks. These collections contained a magnificent lot of flowers in a perfect stage of beauty and form.

The next large class in the nurserymen's division was for thirty-six distinct varieties, three of each, and was again awarded to Colchester, Mr. B. R. Cant and Mr. F. Cant taking 1st and 2nd, in the order named; the 3rd went to Messrs. Dicksons, Newtownards, Ireland, who brought over a wonderfully creditable lot of blooms, especially when one considers the distance they had to travel.

For thirty-six distinct varieties in a lower division, Messrs. Merryweather of Southwell, Prior of Colchester, and Jefferies of Cirencester, were awarded honours in the order named. For eighteen distinct, trebles, Merryweather, Prior, and Messrs. Burch, of Peterborough, were the successful competitors.

Next followed the amateurs' division, and here also the Jubilee Trophy was strongly contested, being finally awarded to S. P. Budd, Esq., of Bath; 2nd honours going to the Rev. J. Pemberton, who ran his opponent very closely indeed; the 3rd was given to E. B. Lindsell, Esq., of Hitchin.

The class for thirty-six single blooms (amateurs) brought out a splendid lot from W. Drew, Esq., The Uplands, Ledbury; Rev. J. Pemberton and Mr. Lindsell being 2nd and 3rd. In the winning stand was a new Rose, a sport from La Duchesse de Morny, which seems of fairly good merit, and quite distinct.

For twelve varieties, three of each, E. B. Lindsell was 1st, with a very heavy lot of blooms; W. Drew, of Ledbury, followed 2nd with one of the most pleasing boxes in the whole show, the blooms being remarkably bright and clean; 3rd was awarded to Mr. Budd, of Bath.

This year there has been a new idea carried out by this Society, viz., to form classes for growers of less than a certain number of plants. It seems to be working exceedingly well. In that for eighteen distinct, single trusses, open to growers of fewer than 2000 plants, W. Boyes, Esq., of Derby, was 1st. A. Whitton, of Bedale, and J. Parker, of Oxford, being 2nd and 3rd.

Twelve distinct, singles, open to the same class of growers, but tied from those competing in the above class, brought out a grand lot from the Rev. L. Garnet, Christleton Rectory, Chester. E. Mawley, Esq., Berkhamstead, and Rev. Page-Roberts, of Scole Rectory, also showed grand lots, and were placed in the above order.

Growers of fewer than 1000 plants of exhibition varieties have a class to themselves as well, and this seems a very fair and judicious arrangement, as evidenced by the strong competition in these new classes or divisions.

For twelve singles, T. Tatham, Esq., Wilmslow; Colonel F. Standish-Hore, St. Asaph; and J. Ough, Esq., Hereford, were the successful competitors, and in the order named.

Growers of fewer than 500 plants were only required to show six single trusses, distinct varieties. Mr. R. Park, Bedale, Yorks; Dr. W. Bell, New Brighton; and Mr. T. R. Fleming, Rowton, Chester, taking honours as placed.

The classes in the local division, open to amateurs within thirty miles of Chester, brought together several competitors. The chief class, for twenty-four distinct, single trusses, going to the Rev. L. Garnet, of Chester, who showed an extra good example of Duchess of Bedford; also good flowers of Le Havre, Rosiériste Jacobs, and Charles Lefebvre. C. Burgess, Esq., Chester, and Mr. W. Stubbs, of Nantwich, were 2nd and 3rd, with really good collections.

For twelve distinct singles (under the same conditions, but debarred from those competing in the higher class), Colonel F. Standish-Hore, St. Asaph, was 1st; Mr. W. Taylor, Chester, 2nd; and Mr. H. G. Roberts, Hope, Mold, 3rd.

Six distinct singles.—1st, T. Raffles Bulley, Esq., Liccard; 2nd, A. Baker, Esq., Crewe; 3rd, T. R. Fleming, Esq., Chester. The 1st prize for six Teas or Noisettes went to Colonel F. Standish-Hore, who exhibited splendid blooms of Rubens, Jean Ducher, Innocente Pirola, Hon. Edith Gifford, C. Kuster, and C. de Nadaillac. The Rev. L. Garnet, of Christleton Rectory, was 2nd; Mr. W. Stubbs, of Nantwich, being 3rd. Each of these gentlemen put up some first-class and well-finished flowers.

An amateur's class for six new Roses only brought out one competitor, the Rev. J. Pemberton, who was awarded 1st. The same exhibitor was awarded 1st in the next class for nine trusses of H.P. Marie Baumann; C. Burgess, Esq., being 2nd for Mrs. John Laing; and S. P. Budd, Esq., 3rd, also for M. Baumann. The awards for six single trusses went to J. G. Churton, Esq., Neston; Mr. R. Park, Bedale; and Miss Mellich, Worksop, in the order named. This lady also got 1st for a collection of garden Roses, being closely followed by the Rev. J. Pemberton. Both of these were excellent lots, and must have afforded the judges some difficulty in coming to a decision.

Next in order came the Tea and Noisette division. In that for twelve varieties, three of each, Mr. E. R. Cant, Colchester, was first with a lot

of flowers that were a trifle dirty and weather-beaten. Mr. Merryweather and Mr. F. Cant followed very closely with good flowers, the last-named having an exceptionally clean lot, but somewhat smaller, and of less substance.

Eighteen single Teas were strongly contested, Mr. Prince, of Oxford, being 1st; B. R. Cant and Frank Cant again following one another for 2nd and 3rd prizes.

Twelve single Teas were shown by Prior & Son, Colchester; H. Merryweather, Southwell; and J. Mattock of Oxford; the prizes going in the same order as placed. The 1st and 2nd in this class were the cause of several comments during the day, and the majority of growers would evidently have reversed the order had the decision rested with them. Mr. Merryweather's were an exceptionally clean and grandly built-up lot, while those of Messrs. Prior & Son were rather weather-beaten and rough in comparison.

Twelve Teas (amateurs, open).—Rev. Burnside, Dr. Budd, and A. Hill-Gray, Esq., were placed in the above order, the 1st prize being a grand collection.

In the class for six Teas (amateurs), A. Hill-Gray, Esq., Rev. Burnside, and Dr. Budd, changed orders; a good proof of how closely these two classes were contested.

In the class for nine distinct Teas, open only to growers of fewer than 500 plants of exhibition varieties, J. Parker, Esq., Oxford, was 1st with grand blooms; C. Kuster, E. de Lyon (good), Innocente Pirola, E. Gifford, and M. van Houtte being very noticeable. E. Mawley, Esq., of Berkhamstead, was a good 2nd with grand examples of Madame Lambard, Madame Iloste, Souvenir de S. A. Prince, C. Kuster, and others. The 3rd prize went to Mr. Boyes, Bank House, Derby. The competition in this class was numerous and very keen.

Six single Teas, for those with less than 200 plants, was awarded in the following order: Colonel F. Stanwick-Hore, St. Asaph; R. G. Burgess, Esq., Knutsford; and J. Brown, Esq., Manchester.

In the extra classes (amateurs) for nine single trusses of any Tea or Noisette, A. Hill-Gray, Esq., Bath, was 1st with good blooms of Maréchal Niel; Rev. Burnside, Hereford, being 2nd with M. van Houtte. For six trusses of any Tea, Mr. Boyes, Derby, was 1st with Cleopatra; Mr. Parker, Oxford, 2nd with Maréchal Niel; Rev. L. Garnet, Chester, was 3rd with Innocente Pirola.

OPEN CLASSES.

For twelve distinct new Roses, Mr. Merryweather, of Southwell, was a good 1st, the most noteworthy varieties being G. Piganeau, J. Dickson, Bruce Findlay, Danmark (a little too like La France), Mrs. Dickson, and Salamander. Messrs. Dickson, of Newtownards, were 2nd; this last exhibit contained four unnamed seedlings of good promise, particularly one which favours G. Luizet, and Mrs. J. Laing—also another grand seedling, that is much lighter, but of somewhat similar type. The 3rd prize was awarded to Messrs. Paul & Son, Chesbunt.

Twelve trusses of any yellow Rose.—1st, A. Hill-Gray, Esq., with good examples of Maréchal Niel; 2nd, Mr. F. Cant, with C. de Nadaillac; 3rd, Mr. J. Mattock, Oxford, with M. van Houtte.

Twelve of any light pink Rose.—1st, Messrs. A. Dickson & Son, Newtownards, with La France (good); 2nd, Messrs. Harkness & Son, with Mrs. J. Laing; 3rd, Mr. F. Cant, with the same variety.

Twelve of any crimson.—1st, Mr. Merryweather, Southwell, with Gustave Piganeau; 2nd, Mr. Frettingham, Beeston, with Marie Baumann; 3rd, Messrs. Cranston & Co., with the same variety.

Twelve dark velvety-crimson.—1st, Mr. B. R. Cant, with Prince Arthur; 2nd, Messrs. Prior & Son, with Earl of Dufferin; 3rd, Mr. Prince, with Earl of Dufferin.

Twelve single trusses, six of one variety of hybrid perpetual, and six of one Tea-scented kind.—1st, Messrs. Harkness & Son, with G. Piganeau and Jean Ducher—these were wonderfully clean and good; 2nd, Messrs. Prior & Son, with A. K. Williams and C. Mermet; 3rd, Mr. H. Merryweather, with Suzanne-Marie Rodocanachi and The Queen.

For nine bunches of Polyantha Roses, Mr. Mount, of Canterbury, was 1st; Miss Mellish, Worksop, being a good 2nd.

In the class for new seedling Roses or distinct sports, the Gold Medal was awarded to Messrs. Dicksons, of Newtownards, for H.P. Mrs. W. J. Grant. This is a really fine new Rose, of excellent habit, and built up in the form suggested by a combination of Marie Finger and Madame Cusin. Its colour also partakes somewhat of a blend with these two varieties,

but it is brighter and clearer than either; altogether a first-class introduction.

Messrs. Harkness exhibited two sports from H.P. H. Schultheiss, one a pretty striped form under the name of Merrie England, and which is most distinct, and the best of all striped Roses. The other sport was a very pleasing self colour, somewhat after the shade of Her Majesty, but lighter, and very soft and pleasing. It is, in fact, a shade I do not call to mind in any other Rose. As both of these partake of the good qualities of H. Schultheiss, I predict a grand future for them, although they were not considered worthy of so high a honour as that of a Gold Medal.

Mrs. A. Wilson, exhibited by Mr. Swales, of Beverley, is also a grand new Rose, somewhat between Mrs. George Dickson and Mrs. J. Laing in colour and form, but not so full as the latter.

The medals for the best blooms in the show were awarded as follows:—Nurserymen: Best H.P., Mr. Merryweather, for G. Piganeau; best Tea, Messrs. Paul & Son, for Souvenir d'Elise. Amateurs: Best H.P., Rev. J. Pemberton, for C. de Raimbaud; best Tea, E. Mawley, Esq., for Souvenir de S. A. Prince.

Messrs. A. Dicksons, of Newtownards, exhibited forty-eight blooms of their new Rose, Margaret Dickson, which showed it to be an addition to our light Roses of the Merveille de Lyon type. Messrs. Dickson, of Chester, occupied a large recess with a grand collection of herbaceous subjects, and also eighteen large boxes of cut Roses, including all the leading kinds, in addition to several very tastefully arranged garden and button-hole varieties. They also exhibited their new Fern, Adiantum C. veneris imbricatum; a great acquisition, that is equally hardy with the type, and very closely resembling A. Farleyense in size of pinules and colour. Altogether this was one of the best Rose shows held, and it was a great misfortune that the weather should have been so bad.

WALTHAM ABBEY HORTICULTURAL SOCIETY.

JULY 6.—Among suburban flower shows the annual exhibition of the above society, which took place on Saturday last at Waltham Cross, takes high place. Being so close to some of the leading Rose nurseries there were very fine collections of cut Roses from Messrs. Paul & Son, Old Nurseries, who also had a collection of bunches of hardy flowers, and from Mr. W. Rumsey, Joyning's Nursery, St. Albans. The leading exhibitors of groups and plants were Mr. E. Ayling, gr. to A. J. Hollington, Esq., Enfield; Mr. J. Nicholson, gr. to J. W. Miller, Esq., Sewardstone; Mr. W. Clark, gr. to Sir T. F. Buxton, Bart., Warlies; and Mr. Hopkins, gr. to H. C. B. Bowles, Esq., Enfield. Among some fine specimen stove and greenhouse plants was a very large and striking example of Lantana Iris, the flowers crimson, orange, and buff. Ferns and groups arranged for effect were particularly good. The Achimenes and Caladiums were remarkably fine. Tuberos-rooted Begonias also were in excellent condition. Roses and hardy cut flowers were well shown. Table decorations were very attractive. Fruit was somewhat sparingly shown, but there were very fine Currants and Gooseberries. In the vegetable department the baskets of vegetables and salads were highly praiseworthy, and in all the classes there was a keen competition.

WOLVERHAMPTON HORTICULTURAL EXHIBITION.

JULY 12, 13, 14.—We gave a brief notice of this last week, and have now to add that the weather was not all that could be wished, but there was an enormous attendance each day. Some good specimens of stove and greenhouse plants in flower were staged by Mr. Cypher, and Mr. W. Finch, gardener to Mr. Alderman Marriott, Coventry, both exhibitors being well known for the plants they turn out. Another local exhibitor, Mr. Dyer, gardener to Mrs. Marigold, Edgbaston, Birmingham, is also a rising successful cultivator, and with but scant plant-growing accommodation, exhibits specimens of great merit. Mr. Cypher also was 1st for a handsome group, to which we referred last week; Mr. Dyer, gr. to Mrs. Marigold, Birmingham, 2nd; Mr. J. E. Knight, Wolverhampton, 3rd.

Mr. Cypher was the only competitor in the class for eight Orchids, but these were very fine specimens; and Mr. Finch, gr. to Mr. Alderman Marriott, Coventry, was 1st for six Orchids, a fine lot; fol-

inowed by Mr. Powell, gr. to G. H. Kenrick, Esq., Birmingham, with a capital lot.

Ferns, Fuchsias, Coleus, and Caladiums, were plentiful, and there was an excellent display of bright-coloured, well-grown, medium-sized zonal Pelargoniums, medium-sized specimens, and the 1st prize lot of six tuberous Begonias exhibited by Mr. J. E. Underhill, Wolverhampton, deserve special mention for good culture and the fine quality of the varieties; and he also took 1st honours for a collection of Gloxinias, about thirty plants admirably grown and flowered.

Stove and greenhouse cut blooms and cut herbaceous blooms were well represented in the gentleman's gardeners' classes, and Messrs. Perkins & Sons, Coventry, were to the front in the open classes for bouquets.

Several classes for local amateurs who do not keep a gardener, and a large number of classes for cottagers, were sufficient to fill a large tent, and the cottagers' vegetables were generally fine.

Fruit.—The open classes for fruit were well filled, and a good display was made. For a collection of ten varieties, Mr. McIndoe, gr. to Sir Joseph W. Pease, Bart., Hutton Hall, was 1st; Mr. Bannerman, gr. to Lord Bagot, 2nd; Mr. J. Edmonds, 3rd; and Major Williams, 4th. For four bunches of Grapes, 1st, Mr. Bramwell, gr. to H. H. F. Hayhurst, Esq.; 2nd, R. v. Canon Coventry; 3rd, Mr. Meakin. The Rev. Canon Coventry also took 1st prizes for two bunches of black Grapes, and two of white; also some good Peaches and Nectarines, and Melons were also staged, also smaller collections of fruits.

As we stated last week, Roses were a surprise; so fine and so numerous, many of the great growers giving a generous support to the committee by exhibiting in great strength.

Five lots of seventy-two blooms were staged, Mr. B. R. Cant being 1st, with a very fine lot; Mr. F. Cant a close 2nd; Messrs. Harkness & Sons 3rd.

For forty-eight Roses, Mr. B. R. Cant was again 1st, Messrs. Prior & Sons 2nd, and Messrs. Cooling & Sons 3rd, seven exhibits being staged.

For thirty-six Roses.—1st, Rev. J. H. Pemberton; 2nd, Mr. F. Cant; and for twenty-four Roses, Mr. B. R. Cant was 1st, Messrs. Prior & Sons 2nd, and Messrs. Cooling & Sons 3rd.

Other classes were well filled, the Rev. J. H. Pemberton scoring 1st in some of the amateur classes; Mr. B. R. Cant 1st for twelve Teas, Messrs. Prior & Sons 2nd, and Mr. H. Merryweather 3rd.

Several stands of twelve light Roses, one variety, and twelve darks, one variety, were staged. In the former, Messrs. A. Dickson & Sons, Newtownards, were 1st, with their beautiful Margaret Dickson; Messrs. Prior & Sons 2nd, with Mrs. John Laing; and Mr. B. R. Cant 3rd, with Ernest Metz, a lovely (very fine indeed) Tea-scented. In darks (twelve blooms), 1st, Messrs. Cooling & Sons, with A. K. Williams; 2nd, Messrs. Prior & Sons, with Horace Vernet; 3rd, Mr. B. R. Cant, with Gustave Piganeau, and we may just say that blooms of this fine variety were numerous throughout the exhibition. A Certificate of Merit was awarded to Messrs. Dickson & Sons, Newtownards, for a very fine new Tea, Mrs. W. J. Grant.

Special prizes offered by Messrs. Sutton & Sons, Messrs. Webb & Sons, and Messrs. Carter & Co. were well contested, and in saying that Mr. Waite, gr. to the Hon. W. P. Talbot, Esq., and Mr. Wilkins, gr. to Lady Guest, were the principal winners, the quality of the exhibits will be understood. Mr. Milner, gr. to Miss Talbot, was also a successful exhibitor of vegetables.

Honorary exhibits were numerous, and the place of honour must be given to Messrs. Sutton & Sons, for their splendid group of Gloxinias of high-class quality. Her Majesty is a well-known beautiful pure white, and Duke of York is probably the finest Gloxinia for quality yet seen, and both well deserved the award of First-class Certificate. Mr. W. Allen, gr., Gunton Park, Norwich, received First-class Certificates for his new Strawberries, Lord Suffield and Gunton Park. Messrs. H. Cannell & Son had a stand of bloom of very fine double Begonias of great merit. Mrs. Cornwallis West, Mrs. Lewis Castle, and Mrs. George Bryson especially so, and Messrs. Birkenhead staged a very large collection of choice Ferns. Other honorary exhibits were staged by Messrs. Thomson & Co., Hurst & Co., Cutbush & Son, Cliban & Sons, and others.

On the third day of the exhibition a new departure was tried, by inviting collections of garden decorative Roses of older sorts, and Messrs. Cooling & Sons, were 1st for twenty-four varieties, as well as twelve in bunches, and these and other stands proved to be

of very great interest to visitors. Varieties of old kinds such as Ruga, Fellenberg, Aimée Vihert, Lamarque, J. d'Esperen, Old Moss Crested Provence, York and Lancaster, Félicité Perpétue, Moss Lauri, old common Chios, La Neige, Gloria Mundi, were in company with L'Idéale, Paul's Single White, Pepita, Pissardi, Paul's Single Crimson, Celine Forestier, and some varieties of Rugosa and Miniatus. The ladies seemed to greatly approve of these charming garden varieties, and note-books were in great request.

The public park is in the highest condition, and there are 70 acres of it, admirably kept and decorated, and the Messrs. Green, father and son, are to be congratulated on the success of their efforts to make the exhibition what it was, a representative one on a grand scale.

THE MIDLAND PINK SHOW.

JULY 12.—The Midland growers made a brave show with their Pinks at Wolverhampton, on this date, holding their second annual exhibition of the National Pink Society (Southern Section), in connection with the Wolverhampton Floral Fete. Nothing can be more convenient in the way of arrangement; the fête affords an excellent opportunity for the Midland Pinks to be exhibited, and the exhibition held on this occasion promises well for the future of this interesting member of the fragrant Dianthus. It should be said that one or two growers, at least, were kept away through the operation of domestic occurrences or business necessities.

There were two stands of twelve Pinks, and Mr. A. R. Brown, Handsworth, Birmingham, was placed 1st with a remarkably good stand of distinct varieties, having Jeannette Amy, a new and very fine purple-laced Pink, raised by Mr. Brown, and full of promise; Minerva, Berard, Ethel, Modesty, Ernest, Empress of India, Bertha, Harry Hooper, R. L. Hector, and Godfrey, all large and full, and finely-laced; 2nd, Mr. C. F. Thurstan, Wolverhampton, the Hon. Secretary of the Society, with Duke of York, a seedling of 1891, a very fine red-laced—pure white ground, finely-shaped petal, well laced, and highly promising; Duchess of Fife, Boiard, Modesty, Empress of India, John Dorrington, Lady Louisa, James Thurstan, and seedling.

Class 2 was for stands of twelve blooms, in not less than six varieties, three competing, and here Mr. A. R. Brown was again 1st, with Boiard, Amy, Ethel, Ernest, Bertram, Minerva, Godfrey, and Empress of India, a few being in duplicate; 2nd, Mr. Robert Sydenham, with Boiard, Ne Plus Ultra, Eurydice, Modesty, Minerva, and Harry Hooper.

In class 3, for six blooms, distinct varieties, Mr. A. R. Brown was 1st, with excellent blooms of Amy, Bertha, Ada Louisa, Minerva, Ophelia, and Empress of India; 2nd, Mr. C. F. Thurstan, with Duke of York, Modesty, Duchess of Fife (like a pale form of Modesty), Ada Louisa, Boiard, and a seedling.

With six blooms, in not less than three varieties, Mr. A. R. Brown again took the lead, with Amy (two blooms), Minerva, Bertram, R. L. Hector, and Rosy Morn; 2nd, Mr. C. F. Thurstan, with two blooms of Harry Hooper and seedlings.

In the class for six blooms in not less than three varieties for those growers who have never won a prize for Pinks, Mr. J. Jester was the only exhibitor, having Modesty, Boiard, Eurydice, Rosy Morn, and two blooms of John Love.

The class for three blooms in three varieties, brought three exhibitors, and Mr. C. F. Thurstan was 1st with three seedlings; 2nd, Mr. A. R. Brown, with Amy, Godfrey, and Bertram.

Then followed prizes for single blooms of purple and red-laced Pinks; those for the former were awarded as follows:—1st, Mr. A. R. Brown, with Amy; and 2nd, with George White; 3rd, Mr. R. Sydenham, with Rector; 4th and 5th, Mr. C. F. Thurstan, with Mrs. Thurstan. The prizes for red-laced went as follows:—1st, Mr. A. R. Brown, with Empress of India; and 2nd, with Bertram; 3rd, Mr. C. F. Thurstan, with Eurydice.

The premier purple-laced Pink was Amy, shown by Mr. A. R. Brown in class 1. The premier red-laced, Duke of York, shown by Mr. C. F. Thurstan in the same class.

The class for six bunches of Pinks, including border varieties, brought a capital stand from Mr. Thos. Walkden, Sale, who had fine bunches of Souvenir de Sale, Progress, W. Brownhill, white; Emily, a laced Pink; Picotee Pink, white laced with pink, very pretty; and a Seedling. Messrs. Thomson & Son, were 2nd, with good bunches of

Ascot, Lord Lyon, Derby Day, Pelican, white; Her Majesty, and Daniel O'Rourke, a laced variety.

Messrs. Thomson had the best bouquet of Pinks; Mr. W. Brownhill was 2nd.

SCOTLAND.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

THE acting directors of this society held a meeting in the office of the secretary (Mr. A. M. Byres, C.A.) on the 16th inst. There was a full attendance. In the absence of Colonel Crombie through indisposition, Mr. Alexander Robson, of Messrs. W. Smith & Son, seedsmen, was called to the chair. Prizes were intimated from Her Majesty the Queen, the Duke of Fife and H.R.H. the Duchess, Messrs. Doulton & Co., Lambeth, and others. After careful consideration it was agreed to give the Queen's prize—a handsome solid silver salad bowl—for a collection of best-grown plants. The Fife prize was awarded for a bouquet of wild flowers, open to boys and girls under sixteen years of age, and for which no entry fee will be charged. Messrs. Doulton's valuable prize is given for a collection of cut flowers arranged for effect. Should the floral gala and military tournament result in a financial success, it is proposed to increase the prize money offered in the schedule *pro rata* to the extent of 50 per cent. The show will be held in the Central Park, Kittybrewster, Aberdeen, on August 18, 19, and 20. The directors are sparing no pains to make the exhibition a useful and interesting one and as the season is rather a late one, it is expected that the exhibits will be in capital condition.

ROYAL CALEDONIAN SOCIETY'S ROSE SHOW.

JULY 13.—This show was opened on a fine summer's day, succeeding one that reminded us forcibly of November, and great fears were felt by many that the exhibition would prove a failure, but such was not the case. Though many keen exhibitors were absent owing to the lateness of the season, prizes to the number of 137 (some of them very tempting), were offered for plants, cut flowers (including Roses), fruits, and vegetables. The Roses were, as usual, the one attraction, especially to the ladies, who were in great force, and crowded round the show tables. Nurserymen did well by the fine display which they made on the tables, and were represented as strongly as ever. Tree Ferns, Palms, and Conifers assisted to form a broken line of greenery between the pillars of the show hall.

Beginning at the west end of the building, a small unpretending exhibit was placed, forming a table of Araucaria excelsa, intermingled with various Palms. This species of Conifer appears to be greatly in demand. The exhibitor (Mr. A. Glass, nurseryman, Edinburgh), like others, is fast increasing his stock of it. Messrs. Laird was next with a neatly arranged table, consisting of some choice Crotons, one called Challenger being of extra merit; *Dracæna Duchess of Portland*, very fine; *Lilium Harrisii*, fine; *Caladiums* in variety; *Hæmanthus Katherina*, very telling. Mr. D. W. Thomson, of Golden Acre Nurseries, was, as usual, exhibiting fine Crotons, *Dracænas*, *Nepenthes*, amongst them *N. Mastersiana* in fine form—this is a comparatively hardy species, that is able to withstand more rough treatment than any other; new *Caladiums*, Palms, showy *Gloxinias* interspersed with Ferns, &c., formed a very pleasing exhibit. Messrs. Methven & Sons' table was brilliant with choice flowering plants, as *Bouvardias*, novelties in double-flowered *Pelargoniums*, *P. Comte Horace de Choiseul* being conspicuous among them; *Isadore Ferrel* also was a showy variety. A line of nice Palms mixed with variegated *Ficus elastica*, formed a telling line in the centre of this table.

Dickson & Co. were rich in Palms, *Liliums*, and Ferns, with numerous groups of their choicest *Violas* and *Pansies*—these if they had been placed apart from the other plants, would have been an improvement. Mr. Dobbie's tufted *Pansies*, in immense numbers, ranging in colours from white to dark purple,

was a great attraction. His Sweet Peas too, were in great variety, and also beautiful.

A table which requires special mention was that from Messrs. Laing & Mather, Kelso, and admitted on all hands to be a grand feature, viz., a long table loaded with beautifully-flowered and grown Carnation Souvenir de la Malmaison, pink and white varieties mixed; basketfuls of Carnation Germania placed among the other varieties, and the whole interspersed with Ferns. It was awarded a well-deserved special prize. Carnation Gloire de Nancy was admired on this table.

Mr. Cuthbertson had a splendid display of cut herbaceous flowers.

Among the gardeners' tables, Mr. Wood, of Oswald Road Gardens, had a good display of *Odontoglossum Pescatorei*, *Thunia Veitchii*, *Crotons*, *Palms*, *Ferns*, &c. Among the exhibits of foliage plants, Mr. Alexander Chreighton, Liberton, had a fine plant of *Croton Thomsonii* and *Dracena elegantissimum*.

Six foliage plants in pots.—This exhibit was made up chiefly with *Palms*, *Crotons*, *Dracaenas*. There is nothing very special in the various exhibits in this class.

For four Orchids, Mr. Sharp, Freeland's Gardens, had *Lælia elegans* in beautiful colour, but with only one spike; *Odontoglossum Alexandra*, with five spikes; *Cattleya Gaskelliana*, five spikes; and a plant of *C. Mossiae*, with six flower-spikes. For two Orchids, Mr. Woods, Oswald Road, was 1st, for *Cattleya Sanderiana* and *Vanda suavis*; Mr. A. Findlay, 2nd. Mr. Sharp was deservedly 1st for one Orchid with a well-grown plant of *Cypripedium Veitchii*, with fourteen well-developed flowers.

Gleichenias, well grown, were placed on a table with some fine specimen Ferns. The *Adiantum* species were in varied and fine form. Mr. Chreighton had six table plants, and was 1st among many exhibitors. *Fuchsias*, *Caladiums*, zonal and tricolor *Pelargoniums*, remarkably fine, filled up the spacious tables, and *Carnations* in pairs, of huge size and well-flowered, and alpine, made a fine display.

Passing on to the tables of *Roses*, there were enough blooms shown, were they noticed in detail, to fill a large report, but many attractive and meritorious exhibits must be passed over. Mr. Cocker tabled a grand non-competitive display. He was too late in entering, and had to be excluded from the competition, but like a true Aberdonian was not to be precluded from showing what he can do in the far north-east. He had, in great numbers, excellent Teas and hybrid perpetuals, *Lady Fitzwilliam*, *Maréchal Neil*, *Comtesse de Panisse*, *Viscountess Folkestone*, *Rubens*, *Comtesse de Nadaillac*, *Souvenir d'Elise Vardon*, *Madame Hoste*, *Princess Beatrice*, *Jean Ducher*, *Princess of Wales*, and many others which filled a large amount of space. Following these was a grand display of herbaceous flowers arranged to give the best effect, *Pyrethrums*, *Pæonies*, *Gaillardias*, *Campanulas*, *Chrysanthemums* (*C. semiduplex* was very conspicuous); *Delphiniums*, *D. Brunonianum*, being strongly Musk-scented; *Lychnia*, *Inula flookeri*, and many others formed a fine feature.

Messrs. Dickson, Belmont, near Belfast, took the lead, as usual, with an imposing and varied display of *Roses*. Messrs. Dickson have to complain of deficiency of colour in their *Roses* this year. They were placed 1st in most of the *Rose* classes in which they entered, and among their forty-eight distinct blooms were *Margaret Decon*, a grand white; *Marchioness of Dufferin*, *Salamander*, *Duke of Edinburgh*, *La France*, *Marie Baumann*, *Charles Lefebvre*, *Earl of Dufferin*, *Louis van Houtte*, *Madame Lacharme*, *La Rosier*, and *Pride of Waltham*. Mr. Crole made a good 2nd with many fine varieties; *Senateur Vaisse*, still a grandly formed old *Rose*, stood out well among many novelties. Mr. Dickson had twenty-four, and was placed 1st in that class; Mr. Crole was 1st for twenty-four Teas.

In the class for twelve trusses Mr. Dickson was 1st for finely formed blooms; and Mr. Crole was a capital 2nd among a great many competitors; *Duke of Edinburgh* was extra brilliant, and it is still a

telling exhibition *Rose*. It was found on Mr. Dickson's stand.

Fruit.—This which was really a fine display, of excellent quality, and in most cases the size was also good. Mr. J. Boyd, Callendar Park, was the only exhibitor of a collection of fruit. He had fine well-finished *Black Hamburg* and *Madresfield Court Grapes*, *Early Rivers Peaches*, *Best-of-all Melon*, *Queen Pine-apples*, *brown Turkey Figs*, *Lord Napier Nectarines*, and *Laxton's Noble Strawberries*, clean and well arranged. The 1st prize for one *Pin-eapple* was taken by Mr. Murray, gr., *Culzean Castle*; 2nd to Mr. Boyd. Four bunches of *Grapes* were shown very largely: 1st, Mr. Smith, gr., *Oxenford Castle*, having excellent *Black Hamburgs* and *Buckland Sweetwater*, two of each. Mr. W. Murray, gr., *Park Hall*, was 2nd, with *Bowood Muscat*, with extra fine bunches and berries, but rather under-ripe, and *Black Hamburg*; 3rd, Mr. Morrison, gr., *Archerfield*.

For two bunches of *Black Hamburgs*, Mr. Murray, gr., *Parkhall*, had a pair of the finest bunches which have been exhibited at *Edinburgh*, perfect in colour, of fine form, and about 5 lb. in weight. Mr. Smith, gr., *Oxenford Castle*, was 2nd, with very fine bunches; and Mr. Mattison, *Currie Hill*, had fine bunches, large in berry, and well coloured. There were others, in fine form, from *Callendar*, *Keir*, and elsewhere.

Two bunches of any other *black Grapes* were represented by two beautifully-coloured bunches of *Madresfield Court*—not large in berry, but the bunches of perfect shape. Two bunches of *white Grapes* were represented by very fine ones of *Bowood Muscat*—large in bunch and berry, but under-ripe. Other *white Grapes* were numerous, but somewhat under-ripe in all cases.

Peaches were both numerous and good. Six extra fine-coloured *Peaches* came from Mr. D. Buchanan, and were placed 1st; Mr. Dobbie, gr., *Drum*; and Mr. Smith, *Hopetoun*, were placed 2nd and 3rd respectively. *Nectarines* were excellent, Mr. Smith, *Hopetoun*, showing the best six *Lord Napier*; and Mr. Smith, *Oxenford*, 2nd.

Figs were finer than usual, and the best dish exhibited, that of Mr. Smith, *Oxenford*. *Melons* were fair in appearance, but not of good flavour. Mr. Angus, *Dalzell Gardens*, was 1st. Among *Cherries*, the best were from Mr. Brown, gr. *Pittendreich*. *Strawberries* were represented by *Noble* and *V. Héricart de Thury*. Two exhibits from Mr. Allan, *Ganton Park*, *Norfolk*, were deservedly awarded *First-class Certificates*. They were well tested by numerous judges, all of whom were unanimous of the excellence of the fruit.

Among vegetables there is nothing of very great merit, except *Duke of Albany Peas*, large in pod, well filled, and of fine flavour; one collection of twelve varieties, including fine *Peas*, *Celery*, *Carrots*, *Potatoes*, *Cucumbers*, and *Vegetable Marrows*, a large dish of almost useless *Mushrooms* spoiling the effect of an otherwise fine exhibit. *Cauliflowers*, *Cucumbers*, *Carrots*, and *Turnips*, were plentiful, and of good quality. A collection of *salads*, in great variety, was interesting as an exhibit. A table loaded with immense stalks of *Rhubarb* was the ugliest feature of the show—*Stott's Champion*, especially—such stuff should, I think, not be allowed to mar the nice effect of a fine horticultural exhibition. M. T.

NURSERY NOTES.

MESSRS. J. PEED & SON.

ALTHOUGH standing on comparatively little ground, the nursery belonging to the above firm, and situate at *Roupell Park*, *Norwood Road*, *S.E.*, is full of interest to the visitor. Like some other of the nurseries in and about town, there is not the least scrap of ground but is made use of, and there are a score or more of houses all filled to their utmost capacity. Immediately after our visit, the annual show of *Gloxinias* was to take place, and the plants were

already looking very show-like, and had been gathered together into one lean-to house with three divisions, the whole about 150 feet long, and containing some 5000 plants. Mr. Peed claims to have secured a first-rate strain, and was the only competitor in the nurserymen's class at the last show at *Earl's Court*. In two or three span-roofed houses there were 2000 to 3000 pot Vines of different sizes, some for fruiting next year, and others only obtained from eyes this season. They are grown comparatively cool, and upon the three years' system. The permanent viney is a lean-to about 160 feet long, in three divisions, and the rods are all carrying satisfactory crops, being chiefly for market. They are cropped heavily, and the bunches run about 1 to 1½ lb. The varieties were, *whites*, *Muscat of Alexandria*, *Trebbiana*, *Forster's Seedling*; and *black*, *Alicante*, *Black Hamburg*, and *Gros Colmar* of the blacks. In a lean-to house, well exposed to the sun, were a fine lot of *Caladiums*, some in 10-inch pots, and forming striking specimens, and others, in 6-in. and 7-in. pots. We noticed that most of the newer varieties were included here.

Passing to another span-roofed house we saw a batch of *Crotons*, which were evidently enjoying the intense heat they were subjected to. The plants, such as *Hawkeri*, *Aigburthiensis*, *Prince of Wales*, &c., were dwarf, bushy, and extremely well-coloured. A few *Dracaenas* were to be seen, including some good pieces of *Gladstone*, *Norwoodensis*, *Goldiana*, and *Lindenii*, &c., by the side of which were a number of the useful *Euphorbia Jacquinæflora*, whose habit, however, has always been objectionable.

The *Odontoglossums*, which are grown in two span-roofed houses, are chiefly semi-established plants, and are in a highly-satisfactory condition. Some baskets hanging overhead contained some good plants of *O. Rossi* and its varieties. In the show-house, which is not kept very full during the summer months, were some noble specimens of *Araucaria excelsa*, in 10-inch pots, these were a splendid colour, and stood about 6 feet high. In the latest addition to the houses (which was a good span-roof) there were a lot of *Cœlogyne cristata* in pans, some 2 feet across, well filled with bulbs, healthy and vigorous; also some *Sarracenias*, such as *S. Chelsoni*, *S. Atkinsoniana*, *S. Flambeau*, *S. Drummondii alba*, &c. In the centre were a lot of *Anthuriums*, looking very well, but had just finished blooming. A span-roofed house near the entrance was filled with tuberous-rooted *Begonias* in very full bloom, and in much variety. A good plant of *Marchioness of Bute* was very attractive; the petals are large and good, the greater part of which are pink, but becoming white toward the centre.

Several other houses contained *Palms* and other useful stove and greenhouse foliage plants, and some hundreds of young *Fuchsias*, nice dwarf stuff in 5-inch pots, and just coming into blossom. The varieties included *Avalanche*, *Gipsy Queen*, *Walter Long*, *Prince of Prussia*, *Mrs. Marshall*, *Scarcity*, &c. In the little garden surrounding the houses are 1000 *Chrysanthemums* in about 70 sorts, looking strong and healthy.

In addition to the above, Messrs. J. Peed & Son have about 16 to 20 acres of land at *Streatham*, entirely devoted to fruit trees and *Roses*.

THE SURFACE CULTIVATION AND MANURING OF ORCHARDS.

THE impossibility of teaching anything without learning much, was never more apparent than in the delivery of lectures on technical education in horticulture in different parts of the country. Objections have been taken in advance to such lectures, that they must needs prove too high and dry, and so fly over the heads of one's hearers; or so deeply scientific that the average of town or rural listeners would fail to comprehend. On the contrary, most of them have proved intensely practical, and have turned on such themes as the drainage, digging, cultivation, and manuring of land; but successions of crops for superior produce, and highest profits on different

sorts of soil, the influence of dwarfing stocks, root-pruning, and different modes of training and sizes of trees, on fertility, quality and quantity of produce, the effect of early and late supplies, and of even samples and prices, and such purely practical questions in fruit culture as those that head this paper. Within the last few months the writer has given many lectures, and several so-called demonstrations on the technical aspects—that is, the scientific basis, and the minuter practical details of horticulture—grafting, budding, pruning, training, root-pruning, planting, sowing, packing, the prevention and cure of various diseases, have been thus elucidated and explained. But one and all of these demonstrations are weak and futile contrasted with one of overwhelming force, met with ready-made in a large orchard furnished chiefly with Apples and Plums above, and bush fruit—Gooseberries and Currants—beneath, as a ground crop.

This particular orchard, of between 20 and 30 acres, was in specially good condition; the trees were mostly from twenty-five to thirty or more years' old. They bore a splendid crop last year, and promised an equally heavy one in 1892. The bush-fruits underneath were also in good health, and full of promise of a full supply of Gooseberries and Currants, green and ripe. The chief points that struck a stranger were that the entire surface of the ground had been dug over, a part of it, at least, pretty heavily manured.

The owner would have preferred to manure the entire surface every year, but as he considered from thirty to forty tons per acre only a fair dressing for the heavy work that the trees and bushes had to do, he thought it best to dress about half the trees and bushes liberally every other year. But the shallow digging was done every winter as early in November as practicable. He had never tried nitrate of soda nor sulphate of lime in any form, though as he had to cart most of his dung a long distance, it must have cost him from 10s. to 15s. per load before it reached his fruit trees. The cost of the dressing and of the labour must therefore have proved very heavy. But the owner or hirer of this particular orchard—who lives, and is making money fast enough to add field by field to his own fruit orchard—seems quite content with the results of his surface culture and enrichment. And well he may be, as the following *per contra* results from opposite practice on the same soil, almost the same spot, and with trees of similar age and character will show. I think it was my able coadjutor in the teaching of technical horticulture, Mr. John Wright, who first insisted on the practical importance of telling your hearers what they were not to do as well as what to do. Now it so happens that through some dispute with the vendor or the landlord, there is a weedy wilderness of an acre or more fully stocked with Thistles and other rank weeds and stubble, which foul the cultivated portion to a very material extent. Pity that such conduct should not be indictable, but it seems there is no remedy at law for such nuisances. On this weedy, surrounded by a veritable fruit paradise of beauty and plenty, the trees, as already remarked, are about the same size and age as those in the other portion of the orchard. They look, however, quite worn out and dilapidated, and have borne less fruit every year since thus starved and robbed until last year, when, virtually, there was no fruit at all on this portion, while those on the right and the left, behind and before them, carried what were justly termed break-down crops of fruit of the highest quality.

Talk or write of lectures on technical education on horticulture being useless or otherwise, why, with two vivid pictures of this fertile orchard, with its plague-spot of barrenness, and the causes of the difference between the two portions clearly explained, such a practical demonstration of surface culture and manuring might be afforded as would double the produce of existing orchards, and multiply their areas enormously. Neither could the most ignorant miss or ignore the intensely practical

teaching of such illustrations, while the more learned would be none the worse for reading, marking, and inwardly digesting the deeper significance of such lessons afresh. *D. T. Fish.*

VEGETABLES.

LITTLE GEM PEA.

On June 8, when having a look round the gardens at Wilton House, I noticed a fine crop of Little Gem Pea growing in a raised south border. There were several short rows of Little Gem and Ringleader growing side by side, but the former was several days the earlier. The haulms, from 15 to 18 inches high, carried numerous well-filled pods, and Mr. Challis told me that he had made one or two gatherings, which, for the present season, was early. It is true the situation is favourable, the narrow border being partly protected by a glass wall coping; but this fact, all the same, goes to show that Little Gem is at least a week earlier than that good old Pea, Ringleader. *H. W. W.*

JUNE BROCCOLI.

To-day (June 29) a parcel came to hand containing two of the finest formed Broccolis we have seen for a long time; the quality is excellent, being spherical in form, very white, and of close, firm substance, and well protected by tender green leaves. This variety is named Methven's June Broccoli. The heads we are now admiring were grown at Baughholm, near Edinburgh, by a market gardener, on whose land was no shade to retard these Broccolis. The soil is somewhat light and warm, and the position is where frost and sun have full power over the plants. Methven & Sons, Princes Street, Edinburgh, have had this in their catalogue for several seasons, and to them we are indebted for the heads before us. July Broccoli might be the name for this fine sort, as the cultivator will be able to cut heads during the first week of July. *M. Temple, Carron House, Stirlingshire.*

LAW NOTES.

CONSPIRING TO DEFRAUD AT TUNBRIDGE WELLS.

Thomas Franklin Catterall, alias George Sims, 37, agent, and William Pearce Amies, 65, baker, were charged with conspiring together to cheat and defraud James Lawrence and Elizabeth Hepzibah Cripps, and divers other persons, of Carrots, hay, and other goods and chattels, at Tunbridge Wells and other places, in the month of March, 1892. Both prisoners pleaded guilty.

Detective-sergt. Goddard, stationed at Dartford, deposed that he had known Amies for some time. The extent of the frauds amounted to nearly £1000.

His Lordship sentenced Amies to two years' hard labour, and Catterall to eighteen months' hard labour.

[It appears that Amies is too well known to some of our nurserymen, one of whom writes: "In February, 1889, he answered an advertisement of mine offering Swedes at per truck load in barter or manure. I jumped at the conclusion that W. P. Amies was the proprietor of Amies' Patent Manure. I sent off the Swedes at once, directing the manure to be sent to my station. Need I say the fool and his Swedes were soon parted? The Swedes went, the manure never came. Have any other of your readers been favoured with this gentleman's orders?" Gardening papers please copy.]

VARIORUM.

GREENING OF ETIOLATED LEAVES.—The rapid formation of chlorophyll in blanched leaves exposed to sunlight is a well-known phenomenon, but the exact conditions under which the process

takes place have not yet been definitely determined. Herr Palladin publishes (*Berichte d. d. bot. Ges.*, ix., p. 229) the results of a series of experiments made upon etiolated leaves of Wheat and field Beans (*Vicia Faba*) grown in river sand. The leaves were detached from the petiole and laid in diffused sunlight upon water or solutions of different substances. Leaves of *V. Faba* died in distilled water after the second day, without formation of chlorophyll, and this also occurred with calcium nitrate solution. In a 10 per cent. solution of cane sugar, all the leaves had become green after two days, though the growth was inconsiderable; but in a mixed solution of calcium nitrate and sugar the normal colour was attained in 24 hours, vigorous growth ensued, and the leaves were still healthy after three days. The result of this experiment confirms the conclusion of Böhm with regard to the favourable influence of calcium salts [lime compounds], upon the growth of etiolated leaves. Palladin also argues from the never failing presence of iron in the ash of etiolated leaves of *V. Faba* that no chlorophyll can be formed by the action of light in the absence of iron, though iron alone is not capable of producing the green colour, as etiolated leaves laid upon solutions of different iron salts of various concentrations remained yellow even when exposed to light. The absence of soluble hydrocarbons in the etiolated leaves of *V. Faba*, as determined by analysis, also indicates that chlorophyll is not formed in the absence of sugar. But though detached leaves remained yellow in distilled water, the formation of chlorophyll in the leaves of entire plants took place at the expense of sugar conveyed by the transpiration current from other parts of the plant. The last results are by no means vitiated by analogous experiments with the etiolated leaves of Wheat which became green after 24 hours in distilled water, since analysis showed the presence of 2.67 per cent. soluble carbohydrates in the fresh leaves, whilst leaves kept in the dark four days after detachment no longer retained the property of greening. *Pharm. Journal.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.

The districts indicated by number in the first column are the following:—

Principal Wheat-producing Districts—0, Scotland, N.; 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, S.
Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather for the week ending July 16, is furnished from the Meteorological Office:—

"The weather was cool, changeable, and unsettled, especially in the more southern districts, where heavy falls of rain were reported, with occasional thunderstorms.

"The temperature was below the mean in all districts, excepting the 'Channel Islands;' the deficit being small (1° to 2°) in Ireland and the south-west of England, but large (4° to 6°) in the eastern and central parts of England. The highest readings, which were registered at varying times in the different districts, were below 70° in the eastern parts of Great Britain, and also in 'Scotland, W.,' and very little above it even in the extreme south of the Kingdom. As a rule the daily maxima over our northern and eastern districts were below 60°. In the 'Channel Islands,' however (at Jersey), the thermometer on the 11th rose to 77°. The lowest readings which also occurred on various dates were very little above 40° in any districts, excepting 'England, E. and S.' and the 'Channel Islands,' and were as low as 37° in 'Scotland, E.,' and 38° in 'Ireland, N.'

"The rainfall was considerably less than the mean in all the northern districts, and entirely absent in 'Scotland, W.' Over the eastern, central, and southern parts of the Kingdom, however, there was a considerable excess, the amount being in many cases more than double the mean for the week.

"The bright sunshine was more prevalent than it was last week in the north and west of Scotland, but decidedly less abundant elsewhere. The percentage of the possible duration ranged from only 8 in the 'Midland Counties,' and 15 in 'England, N.E. and E.,' to 32 in 'Scotland, N.,' 33 in 'Scotland, W.,' 35 in 'England, S.W.,' and to as much as 55 in the 'Channel Islands.'

TRADE NOTICE.

Ma. W. F. TAYLOR, who was for a good many years associated with the firm of Little & Ballantyne, Carlisle, has commenced business on his own account. The business will be carried on under the style of Taylor & Thomson, at 23, Duke Street, Bishopsgate, London, E.

Messrs. Dobbie & Mason, Smithfield Market Seed and Bulb Stores, 22, Oak Street, Manchester, have secured the services of Mr. John Gould, who for a period of eight years occupied that position at their late Deansgate establishment.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

SHOOTIA GALACIFOLIA.—Will some of our correspondents kindly furnish A. T. with particulars regarding the cultivation of this interesting plant?

MARKETS.

COVENT GARDEN, July 21.

MARKET brisk, with supplies good. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Lemons, Melons, Peaches, Currants, Pine-apples, Chael, Strawberries) and their prices per case, dozen, or lb.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantum, Arum, Aspidistra, Begonias, Calceolaria, Coleus, Cyperus, Dracenas, Ferns, Ficus elastica, Fuchsia) and their prices per dozen.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arum, Canterbury Bells, Carnations, Cornflower, Eucharis, Gardenias, Heliotrope, Lilium candidum, Maiden Hair Fern, Marguerites, Mignonette, Orchids, Cattleya, Odontoglossum, Crispum) and their prices per dozen or bunch.

ORCHID-BLOOM in variety.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Beans, Beet, Carrots, Cauliflowers, Cucumbers, Endive, Herbs, Lettuces, Mushrooms, Mustard and Cress, Parsley, Shallots, Spinach, Tomatoes, Turnips) and their prices per punnet, lb., or doz.

POTATOS.

NEW POTATOS.—Kidneys, 5s. to 6s. 6d.; Rounds, 4s. 6d. to 5s. Market dull. OLD POTATOS.—Season virtually over. Best samples command 100s. to 120s. per ton. J. B. Thomas.

SEEDS.

LONDON: July 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe the seed market to date as inanimate and uninteresting. For new Trifolium there is as yet a small inquiry. Some samples of fine new German White Clover seed have been shown: low prices are expected to prevail. The crop of Trefol promises well. Mustard and Rape seed both keep firm. Canary seed, being well supported by export orders, keeps strong. Hemp seed is unchanged. Luseded is slightly dearer. For Blue Peas and Haricot Beans last week's prices are realised.

POTATOS.

BOROUGH, July 19.—Quotations:—St. Malos, 3s. 6d. to 4s. 6d.; Jerseys, 4s. 6d. to 5s. 6d.; Cherbourg, 4s. to 5s. per cwt.; English Early Rose, 90s. to 90s.; Hebrons, 80s. to 100s. per ton. Old: Bruce Magnums, 90s. to 100s. per ton.

SPITALFIELDS, July 19.—Quotations:—New: Jersey Kidneys, 4s. 6d. to 4s. 9d.; do. Flukes, 4s. 9d. to 5s.; Cherbourg Rounds, 4s. to 4s. 3d.; do. Kidneys, 4s. 3s. to 4s. 6d.; do. Flukes, 4s. 6d. to 4s. 9d. per cwt. English: Myatt's Kidneys, 4s. 6d. to 5s.; Sutton's Regents, 4s. 3d. to 5s.; Imperators, 4s. 6d. to 5s.; Hebrons, 4s. to 4s. 6d.; Early Rose, 4s. to 4s. 6d. per cwt.

GENERAL AVERAGE: July 20.—New: English Hebrons, 90s. to 100s.; do. Kidneys, 100s. to 110s. per ton; Jerseys, 4s. 6d. to 5s. 6d.; French, 3s. 6d. to 5s. per cwt. Old: Magnums, 90s. to 100s. per ton.

FARRINGTON: July 21.—No Jerseys or Foreign on stand English, 4s. 6d. to 5s. per cwt.

FRUITS AND VEGETABLES.

BOROUGH: July 19.—Quotations:—Cabbages, 3s. to 5s. per tally; Peas, 2s. to 3s. 6d. per bushel; Greens, 1s. 6d.; new Carrots, 3s. 6d. to 4s.; Turnips, 2s. 6d. to 3s.; Parsley, 2s.; Spring Onions, 3s. to 5s. per dozen bunches; Egyptian do., 3s. 6d. to 4s. 6d. per cwt.; English Apples, 3s. per bushel.

SPITALFIELDS, July 19.—Quotations:—Cabbages, 1s. 9d. to 4s. 6d.; Radishes, 4s. to 6s. per tally; Spinach, 1s. to 1s. 6d.; Broad Beans, 1s. 6d. to 2s. per bushel; Turnips, 1s. 6d. to 2s. 6d.; Carrots, 2s. to 2s. 6d.; Spring Onions, 3s. 6d. to 4s. 6d.; Parsley, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 1s. 6d. to 3s.; Cabbage Lettuce, 3d. to 4d.; Leeks, 1s. 9d. to 2s. 6d.; frame Cucumbers, 1s. 6d. to 2s. 6d.; natural do., 1s. to 1s. 6d.; Beetroot, 3d. to 6d. per dozen; Peas, 4s. 6d. to 6s. per sack; Cos Lettuce, 6d. to 10d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Horseradish, 1s. to 1s. 2d. per hundred; Mint, 1s. 6d. to 2s. per dozen bundles; New Zealand Apples, 5s. to 7s.; foreign Tomatoes, 9d. to 1s. per box; Gooseberries, 2s. 3d. to 4s.; black Currants, 5s. 3d. to 5s. 6d.; white do., 4s. to 5s.; red do., 5s. to 5s. 9d.; black Currants, 2s. to 3s. 6d.; white do., 3s. 2d. to 5s. per half-sieve; Raspberries, 3d. to 3 1/2d. per lb. punnet; do., 22s. to 25s. per cwt.; Strawberries, 1s. 6d. to 2s. 9d. per peck.

FARRINGTON: July 21.—Quotations:—Cabbages, 3s. to 5s. per tally; Spinach, 4d. to 6d. per bushel; Turnips, 5s. per tally; Carrots, 5s. per dozen large bunches; spring Onions, 3s. to 4s. per dozen bunches; Spinach do., 6s. per case; Egyptian do., 4s. to 5s. per cwt.; Lettuces, 6d. to 10d. per score; Cucumbers, 1s. 6d. to 3s. per dozen; Peas, best blues, 8s. per bag; Cherries, 4s. to 4s. 6d. per half-sieve; black do., 10s. to 12s. per bushel; Currants, black, 7s. per half-sieve; Gage Plum (foreign), 2s. per box of 8 lb.; Apples, New Zealand, 3s. 6d. per box.

NOTICES TO CORRESPONDENTS.

CATTLEA LEAVES: P. W., Magdebury. There is no insect or fungus on your leaves that we can find. We believe the appearances to be due to some faulty management; probably defective ventilation combined with too great heat.

FUNGUS IN MOSS: G. Wright. Red = Agaricus (Mycena) acicula, Sch. White, shrivelled beyond recognition. M. C. C.

INSECT ON GOOSEBERRY LEAVES: G. P. The Acarus on the leaves is the, unfortunately, only too well-known Bryobia speciosa; it swarms literally in millions in gardens round London and elsewhere; it is, perhaps, fondest of Ivy, upon which plant in gardens, it may generally be found, but it does not confine itself to any one plant. It is quite correct to suppose it to be related to red-spider; the two creatures are closely allied. Albert D. Michael.

INSECTS: C. W. B., Dublin. The insects on the shoots are the black aphids, common on Cherries, Peaches, and other stone fruits. It can be destroyed by syringing the trees with, and dipping the ends of the longer shoots in, weak tobacco-water, or by fumigation with Nicotina.

LEAVES OF IVY-LEAF PELARGONIUMS: A. We find no fungus, and the thickened appearance of the leaves is due, we think, to some check to growth, probably from the plants being exposed to draughts of cold air. There has been no extension of the area of the leaves, but the juices have filled the cells to repletion. It bears resemblance to the rust in Grapes, and may be due to the same causes.

MUSHROOM GROWERS ABOUT LONDON: A. B. We have no list of these persons. Some of the dealers in Covent Garden Market might supply the information.

NAMES OF IVY-LEAF PELARGONIUMS: 1. We find no fungus, and the thickened appearance of the leaves is due, we think, to some check to growth, probably from the plants being exposed to draughts of cold air. There has been no extension of the area of the leaves, but the juices have filled the cells to repletion. It bears resemblance to the rust in Grapes, and may be due to the same causes. MUSHROOM GROWERS ABOUT LONDON: A. B. We have no list of these persons. Some of the dealers in Covent Garden Market might supply the information. NAMES OF IVY-LEAF PELARGONIUMS: 1. Spiraea confusa; 2, Rhamnus Frangula; 3, Veronica cressoides; 4, Thalictrum flavum; 5, Nepeta cataria; 6, Digitalis lutea.—Worksop. Monotropa Hypopitys, a flowering plant living on roots; not a fungus.—L. A. W. Bromus secalinus, introduced with foreign seed.—T. C. J. Son. Bryanthus empetrifolia. W. B. 1, Mackaya bella; 2, A hybrid Veronica, like Andersoni, but darker coloured; 3, Veronica salicifolia.—R Stanley. A Robinia, probably; can you not send flowers?—A. R. 2, Jasminum gracillimum; 3, An Acanthad; send when in flower; 4, Thuobergia alata Anrantiaca; 5, Adiantum Waltoni. E. N. Dendrobium Bensoniae.—F. K. 1, Lycaste Depeii; 2, Oncidium Lauceanum var.—S. Ely. 1, Cattleya intermedia; 2, Lygodium circinatum; 3, Polypodium vacciniifolium.—R. Y. A. 1, Chenopodium album; 2, Epilobium tetragonum; 3, Polygonum Persicaria; 4, Polygonum aviculare; 5, Silaus pratensis; 6, Chenopodium rubrum, but not developed.

PATENT PROPAGATING AND SEED-BOX: T. W. W.—A useful well-made box; but the idea is a very old one. Gardeners having found such boxes useful for placing on hot-beds on hot-water pipes and flues when raising seeds or striking cuttings for the past hundred years. The slate bottom, useful enough where heat is used, would have a retarding effect on the rooting of cuttings, &c., owing to its coldness when the box is used for the cold striking of plants.

PEAS: A. M. D. Your Peas are fasciated; several branches are united. We cannot tell you the name. You should send such questions to the Editor, not to the Publisher.

PETUNIAS: T. H.—It is not unusual for the flowers to become more or less leafy. We do not think it is worth propagating for your purposes.

PLANTS WITH DIRTY LEAVES: Clues Bros. Mycelium of Fumago, apparently, which commonly is developed upon the excretory fluid of aphides. M. C. C.

PRUNING FILBERTS: S. B.—Wait till January or February, when the female blossoms appear.

RUNNERS OF THE STRAWBERRY FOR FORCING: Sub-scriber. There is no necessity for planting yearly merely to obtain runners for forcing, as excellent forcing plants may be got from any robust plantation, even if be three or four years old. Select two or three of the strongest runners on a plant, stopping the growth just in front of the layered plantlet, and using strong rich loam. Keep the runners that are layered well supplied with water in dry weather, and pot them as soon as a good mass of roots is made.

SCHEDULE OF HORTICULTURAL SOCIETY: *A. J. S.* If, instead of using the word "varieties," the schedule-maker had employed kind or species, the confusion would not have occurred. The person who was awarded the 1st prize interpreted the word varieties according to the meaning it was intended to have, but did not have, and really showed twelve species, but he did wrong, we think, in showing several varieties of each species.

SEEDLING CARNATION: *W. & R.* It is a large well-coloured self, and useful for the border. It has a tendency to split.

SPLITTING OF THE STONES OF PEACHES: *W. C.* The reason for the splitting of the stones of Peaches is at present not known with certainty. A sudden change from a dry to a wet state of the soil has been given as the reason; but splitting does not always occur under those conditions. There is always a severance of the kernel from the fruit stalk, and, owing to this, the kernel dies, and usually the fruit opens at the base.

TATE'S ALGEBRA: *L. E. P.* We suspect you have made a mistake. In any case we do not lend crib-books out for profit, nor require any deposit for any service we may render editorially.

TOMATO DISEASE: *A. S., Florist.* The black spot is caused by a fungus, *Cladosporium fulvum*; unfortun-

FIG. 17.—BLACK SPOT IN TOMATOS—CLADOSPORIUM FULVUM.

FIG. 18. BLACK SPOT, LONGITUDINAL SECTION THROUGH THE FRUIT.

nately it is now too common. Occurring on the fruit, especially at the top of the fruit, you could not now apply copper solutions, but you can destroy all the affected plants.

WATER MELONS: *L. P.* Not grown in this country. They would not be generally liked, the flesh being coarse, and flavour not of the finest. In hot climates the plants grow in the fields like any other gourds, and the fruits are much liked for their succulence. In southern Europe the pulp is strewn with a mild kind of red Pepper, or a good red wine is poured over it, a spoon being used in partaking of it.

COMMUNICATIONS RECEIVED—C. R. Clarke—A. Hope—Dr. Russell—D. R. & Co.—J. Veitch & Sons.—W. S.—E. M.—Richard Henderson, too late for insertion.—J. Coomber.—T. W. H.—Robert M. Grey, N. J., U.S.A.—R. D.—J. O.B.—T. S.—J. S.—T. T.—W. E.—H. W. W.—R. A. R.—H. F.—E. M.—E. W. B.—T., too late for answer in this week's issue.

highest respectability, and thoroughly practical at their busi-
ness. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO.
beg to announce that they are constantly receiving
applications from Gardeners seeking situations, and that
they will be able to supply any Lady or Gentleman with
particulars, &c.—St. John's Nurseries, Worcester.

Head Gardeners.
JOHN LAING AND SONS can at present
recommend with every confidence several energetic
and practical Men of tested ability and first-rate character.
Ladies and Gentlemen in want of GARDENERS and BAILIFFS,
and HEAD GARDENERS for first-rate Establishments or
Single-handed Situations, can be suited and have full particu-
lars by applying at Stanstead Park Nurseries, Forest Hill,
London, S.E.

SANDERS, St. Albans, can thoroughly
RECOMMEND several first-class HEAD GARDENERS.
To Noblemen and Gentlemen requiring Land Agents,
STEWARDS, BAILIFFS, or GARDENERS.
JAMES CARTER AND CO. have at all
times upon their Register reliable and competent MEN,
several of whom are personally well known to Messrs. Carter.
Enquiries should be made to 237 and 238, High Holborn, W.C.

TO THE TRADE.—MANAGER, or
GENERAL FOREMAN and SALESMAN (chiefly Glass).
Advertiser (age 35) is desirous of an engagement as above in a
good business. Thoroughly competent and energetic.—
FREEMAN, Gardeners' Chronicle Office, 41, Wellington Street,
Strand, W.C.

GARDENER (HEAD), where three or more
are kept.—Age 29, married, no family; life experience
in all branches. Eight years as Foreman in present place.
Home Counties vicinity preferred.—C. ROGERS, Outledge,
Halstead, Essex.

GARDENER (HEAD).—A LADY wishes to
recommend her Head Gardener, who thoroughly under-
stands all branches. Age 44, single; fifteen years' character
—Miss C. BOLITHO, Troegwainton, Penzance.

£5 will be given for information leading to a
situation as HEAD GARDENER, where four or five
are kept. Experienced in Vines, Orchids, Stove and Green-
house Plants, and Flower and Kitchen garden. Six years'
and a half with present employer; thirteen years' previous
excellent character. Age 39, one son (age 15).—J. GOLDING,
Sharcombe, Wells, Somerset.

GARDENER (HEAD).—LADY HUTT, Appleby
Towers, Ryde, would be pleased to recommend her Head
Gardener, T. D. Myles, to any nobleman or gentleman requir-
ing the services of a good gardener; has been here ten years,
and has had large experience in all matters connected with
gardening, and good testimonials from previous employers.
Leaving through alteration in the establishment.

GARDENER (HEAD).—Age 44, married,
no children; life-long experience in Noblemen's and
Gentlemen's Gardens. Thirteen years in last situation.
Highly recommended.—S. L., Shipbourne, Tonbridge, Kent.

GARDENER (HEAD WORKING).—Age 39, married, no family; well up in all branches. Excellent testimonials as to character, &c.—WRIGHT, 138, Barnsbury Road, Islington, London, N.

GARDENER (HEAD WORKING).—Age 37; married; thoroughly practical in all branches. Eight years' excellent character as Head Gardener from last situation.—LANGSTON, Shardlow, near Derby.

GARDENER (HEAD WORKING).—Thoroughly competent in all branches, including the laying out and planting of grounds, the building and heating of all kinds of Fruit and Plant-houses; life experience. Middle aged, married. Long character, and excellent testimonials.—W. M. HOPKINS, Ivy Cottage, Millfield Lane, Highgate, N.

GARDENER (HEAD WORKING); age 48.—A GENTLEMAN wishes to recommend his head working gardener, thoroughly experienced in Vines, early and late, practical in all its branches. Agricultural, land, and stock. Leaving through Gentleman selling the estate. Twenty years' good character.—JAMES POLLICUTT, Percy Avenue, Ashford, Middlesex.

GARDENER (HEAD WORKING); age 36, married, without family.—ADVERTISER, who has had a thorough training in all branches of Gardening, and sixteen years' experience in First-class Establishments, would be glad to send full particulars to any Lady or Gentleman requiring a good Gardener. Highest references. Four years General Foreman in present place.—BLOOMFIELD, Ashted Park Gardens, near Epsom.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 30, married; good character from past and present employers.—E. A., Weston Park, Stevenage, Herts.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 32, married, two children, youngest 5 years; thoroughly understands Gardening in all branches, Early and Late Forcing, Peaches, Vines, Melons, Cucumbers, and Tomatos. Highly recommended by present and late employers.—D. F., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING).—Age 39, married; thorough practical knowledge of all branches. Four years in present situation; leaving through breaking up of establishment. Strongly recommended by present employer.—A. BARKER, The Gardens, Marton Hall, Marton R. S. O., Yorks.

GARDENER (HEAD WORKING, or SINGLE-HANDED).—Age 28, married; experienced. Seven years' personal reference from last employer.—C. TUCKER, Holden Hill, Hendoo, N.W.

GARDENER (HEAD WORKING).—Age 40, married, one child; experienced in all branches of the Garden. Good references from past and present employers.—E. WING, Primrose Hill, Tonbridge, Kent.

GARDENER (HEAD WORKING), or good SINGLE-HANDED.—Middle-aged, married; life experience. Good testimonials as to thorough trustworthiness, &c.—M. G., Mr. Jones, Market Place, East Finchley, N.

GARDENER (HEAD WORKING), or good SINGLE-HANDED.—Age 34, married; nineteen years practical experience in all branches. Three years' personal character.—S. M., 3, Henstridge Place, St. John's Wood, N.W.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 31; fifteen years' experience. Understands Kitchen Garden, Vines, Peaches, Cucumbers, Melons, Tomatos, Stove and Greenhouse Plants.—RUSSELL, 6, Aostey Road, Peckham, S.E.

GARDENER (HEAD, or good SINGLE-HANDED).—Vines, Melons, Cucumbers, &c., Stove and Greenhouse Plants. Good character. Leaving for no fault.—A. BOOKER, Grange Gardens, Acton Lane, Willesden, N.W.

GARDENER (SINGLE-HANDED, or otherwise); age 30, married, one child.—A Gentleman wishes to find his Gardener a situation as above. Three years' character. G. NORRIS, Norton, Yarmouth, Isle of Wight.

GARDENER (SINGLE-HANDED).—Age 26, single at present; four and a half years' excellent reference from present employer. Twelve years' experience.—J. CHARMAN, 22, Tollington Road, Holloway, N.

GARDENER (SINGLE-HANDED).—Age 23, single; seven years' good experience. Inside and Out. Five years' good character.—G. CORNWELL, Hadlow Down, Buxted, Sussex.

GARDENER (SINGLE, or where two are kept).—Age 30, married, no family; willing. Good all-round man. Good references.—M. J., F. Crumpler, Cowley Road, Uxbridge, Middlesex.

GARDENER (good SINGLE-HANDED, or where help is given).—Age 25; twelve years' experience. Excellent character.—A. W., S. Daniels, Nurseryman, Wellington Road, Forest Gate, E.

GARDENER (SINGLE-HANDED, or with more).—Married, no family. Thoroughly experienced in all branches; good character.—A. HOLTGATE, Colnbrook Gardens, Grosvenor Road, Gunnersbury, W.

GARDENER (SINGLE-HANDED).—Age 28, single; life practical experience in all branches. No objections to board and lodging. Good references.—J. W., Rose Cottage, London Road, Sunninghill, Berks.

GARDENER (SINGLE-HANDED, or where help is given). Married. Has had good experience; can be well recommended.—W. CROOK, 12, Courland Grove, Clapham, S.W.

GARDENER (SECOND), where five or six are kept.—Age 27. Eight years' experience; can be well recommended. Bothy preferred.—H. MIDDLETON, 13, The Grove, Ealing, W.

GARDENER (SECOND), Inside and Out, in a Gentleman's Establishment, where three or four are kept.—Age 22; twelve months' good character, four years previous.—F. STENT, Southborough, Buckley, Kent.

GARDENER, in a small Nursery, as Chrysanthemum Grower.—Age 26; well up in Growing for Show, Sale, and Cut Flowers. Good references.—Particulars of T. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

GARDENER.—Age 42, single; thorough all-round life experience, under Glass, Vines, &c.; home and Australian gardening thoroughly understood. Good personal character of five years. Single-handed not objected to, or two small places. No objection to go to America or the Cape.—W. T., 115, Oval Road, Croydon, Surrey.

GARDENER, FOREMAN, or SECOND in a good private establishment.—Age 27, single; life experience Inside and Out. Seven and half years, as Foreman in last two places. Good references.—W. M. WRIGHT, Tilbury, Halstead, Essex.

GARDENER or FOREMAN.—JOHN COYSH, Gardener, Newbold Revel, Rugby, wishes to recommend a young man (age 26) as above. Well versed in the General Work of a large establishment. First-class Fruit Grower. Character unimpeachable.

GOOD OLD GARDENER.—Industrious, sober, trustworthy; good workman in all branches of Horticulture. Private Nursery, Florist, or Fruit Growing.—GARDENER, 77, High Street, Fulham, London, S.W.

GARDENER (UNDER).—Age 24, single; three years Glass, and five years General Gardening. Three years in present situation. Disengaged August 16. References would be found reliable.—W. BREWSTER, E. F. Milward, Esq., Beechcroft, Shopley Hills, Bromsgrove.

GARDENER (UNDER).—Age 18; three years' experience, Inside and Out. Good references.—R. MATTHEWS, 40, Wellfield, Streatham, S.W.

GARDENER (UNDER).—Age 23; good character. Leaving present situation through a death; abstainer. Disengaged on the 30th.—J. D., The Gardens, Seio House, Putney Heath, S.W.

GARDENER (UNDER), in the Houses, in a Gentleman's establishment.—Age 18; two years' good character. No bothy.—A. H., Watlington Park, Downham, Norfolk.

GARDENER (UNDER).—Age 20; willing to make himself useful, wishing to improve. Good references.—A. H., 7, Queen's Road, Winchester, Hants.

GARDENER (UNDER), or GARDEN LABOURER, in an old establishment in the country.—Age 38; all round experience. Good reference.—GARDENER 52, Danfield Terrace, Otley.

GARDENER (UNDER), Inside, or Inside and Out.—Age 23; nine years' experience. Good character from last situation.—W. B., 38, Richmond Grove, Surbiton.

GARDENER (UNDER), in the Houses.—Age 18; active and obliging. Six years' experience Outside and In. Good references.—W. FARNFIELD, 12, Wellfield Road, Streatham, S.W.

GARDENER (UNDER).—Age 19; situation wanted by a young man, who has had three years' experience. Inside and Out. Good character.—W. PROWING, Stargrove, Newbury.

ORCHID GROWER, in small collection, or FOREMAN in the Houses, where Orchids are grown.—Married; ten years' experience, chiefly Orchids.—G. M., Mount Pleasant, Hildenhoro', Tonbridge.

TO FRUIT GROWERS.—Advertiser (lifetime experience in Growing Choice Fruit, Cut Flowers, &c., for Market), desires to treat with a Gentleman contemplating this business, as MANAGER, and assure good returns for capital invested. Highest references.—POMONA, 41 Wellington Street, Strand, W.C.

SHOPMAN, or MANAGER.—Age 31, married; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references.—LOTHIANS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, or ASSISTANT.—Age 26; experienced in Seeds, Bulbs, Plants, and Floral Work.—T. R., "Shanghai," Southcote Road, Bournemouth.

HOLLOWAY'S OINTMENT and PILLS.—Rheumatism, Neuralgia.—It is sometimes difficult to determine which of these diseases is afflicting the sufferer, but this ignorance will not matter if Holloway's remedies be used. They alleviate and cure all muscular and nervous pains. In hereditary rheumatism, after bathing the affected parts with warm salt water, Holloway's Ointment should be well rubbed upon the spot, that it may penetrate, and exert its soothing and regulating properties on the deeper vessels and nerves which are unduly excited, and cause both the pain and swelling. Holloway's treatment has the merit of removing the disease without debilitating the constitution, which was the inevitable result of the bleeding, mercury and colchicum practice formerly adopted in these complaints.

AWARDED TWENTY PRIZE MEDALS

AT INTERNATIONAL EXHIBITIONS AT HOME AND ABROAD.

KEITH'S PATENT BOILERS, THE "CHALLENGE," "VIADUCT," "PYTHON," &c.,

FOR HOT-WATER HEATING, "STAND FIRST," require no building work round them, are entirely water-jacketed, and heat from 50 feet up to 20,000 feet of 4-inch pipe respectively. Many thousands are in use all over the world, and the Boilers are unrivalled in power and economy.

KEITH'S "PYTHON" BOILER, as illustrated below, has 1000 square feet of effective heating surface, with 17½ square feet of fire-grate area; heats about 20,000 feet of 4-inch pipe, and is the Most Powerful and Complete Sectional "Special" Hot-water Heating Boiler in the World.

This Engraving "illustrates the most powerful form of Boiler that has yet been made for Hot-water Circulation."—Extract from Hoop, on *Warming by Hot-water*, New Edition, 1891.

KEITH'S BOILERS

are almost exclusively used by Her Majesty's Government, at the Home Office, and for the Heating Work of the Prisons throughout the United Kingdom, in preference to all others.

Manufactured under thirty James Keith's Patents in Great Britain, United States, and Canada.

JAMES KEITH (C.E., Assoc. M.Inst.C.E.), Gas, Hydraulic, Heating, Ventilating, and Consulting Engineer. Established 1823. Contractor to Her Majesty's Government. 57, HOLBORN VIADUCT, LONDON, E.C., ALSO AT EDINBURGH AND ARBROATH.

KEITH'S PATENT RAMS & HYDRAULIC RAM-PUMPS, For Raising Water.

The very HIGHEST EFFICIENCY attained in Self-acting Hydraulics, by KEITH'S RAMS.

KEITH'S PATENT "UNIVERSAL" RADIATORS, For Hot-Water Heating. Made in One Piece, and in many Sizes and Modifications. No Joints to Leak. Thousands in use.

SANKEY'S famous GARDEN POTS

Bulwell Potteries, Nottingham.

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."
 Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."
 Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still find them the best and cheapest."
Largest Manufacturers in the World. No Waiting. Millions in Stock. Carriage and Breakage Free on £10 Orders. Half Carriage on £5 Orders. Samples Free.

Five 1st Prize Medals recently awarded in open competition.

Five 1st Prize Medals recently awarded in open competition.

THOMSON AND SONS**, Clovenfords, Galashiels, N.B.

SALES BY AUCTION.

Thursday, August 11.

SPECIAL SALE OF ORCHIDS in FLOWER and BUD.

MR. J. C. STEVENS begs to announce that his next SPECIAL SALE OF ORCHIDS in FLOWER and BUD will take place at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, August 11, at half-past 12 o'clock precisely, and he will be glad if Gentlemen desirous of ENTERING PLANTS for this SALE will please send Lists NOT LATER than THURSDAY NEXT.

Friday Next, August 5, 1892.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 5, at half-past 12 o'clock, by order of Mr. F. SANDER, a grand importation of a new and most remarkable Epidendrum—

EPIDENDRUM IMSCHOOTIANUM,

a most extraordinary and entirely distinct variety, of striking appearance; its stems vary in height from 1 to several feet, clothed from base to top with rigid glaucous leaves, which clasp the stem from opposite sides alternately, reminding one somewhat of the cups of a river-dredger; the stems are stout, erect, and fleshy; the flowers terminal, with large, leafy bracts. It is decidedly a great novelty, and absolutely different from any form or variety ever before offered. Neither time, trouble, nor expense has been spared in gathering together this really remarkable lot of plants.

Two other new and specially fine Epidendrums will also be offered—EPIDENDRUM FOURNIERIANUM and E. ECKHAUTIANUM.

EPIDENDRUM FOURNIERIANUM.

This is a strong-growing, vigorous, and free-blooming variety, somewhat resembling E. Goeseffianum and E. Watsonianum in habit; but on comparison it will at once be seen to be quite distinct and it comes from an entirely different source. The dried flowers of this and Epidendrum Imshoottianum were completely destroyed by moisture, and rendered quite unrecognisable—a circumstance that we greatly regret. The description accompanying the flowers of this states that the ground-colour is lemon-coloured, dotted with crimson spots, the lip in some cases being vivid crimson, and in others pure white; it is many flowered, spikes branching, and singularly fragrant. It is a decided acquisition.

EPIDENDRUM ECKHAUTIANUM

is a new and distinct-looking species, of erect growth; the flowers are produced from the top of the stems, which are from 1 to 2 feet in height, with erect leaves, some alternately on opposite sides.

There will also be included in this Sale a very fine lot of the grand new introduction,

CATLEYA ALEXANDRE.

SOBRALIA IMPERATRIX, the SNOW-WHITE SOBRALIA, CYRTOPIDIUM MACRANTUM, C. SUAVISSIMUM, CEPHEDRUM INSIGNE VAR. HIMALAYICUM, DENDROBIUM NOBILE, INFUNDIBULUM, LUTEOLUM FORMOSUM GLAUCUM, and many other rare and useful Orchids. On view morning of Sale, and Catalogues had.

TO BE SOLD, the Lease, Stock, and Goodwill of a small FLOREST and JOBBING BUSINESS in a good position. Good Dwelling house and Stable; Greenhouses, Pits, &c., heated with hot water. To be had a bargain if sold at once. Satisfactory reasons for disposal.

Apply, G. L. WEBBS, Newsagent, Grove Road, Holloway, N. NURSERY to be SOLD.—ISAAC DAVIES being about to retire from Business, owing to the death of his son and his own advanced age. The Land consists of over 5 1/2 acres, own Freehold, and 1 1/2 acre adjoining, at a small rent, with a good substantial dwelling-house, built on his land, with all necessary conveniences; also stable, parking and potting sheds, three greenhouses, propagating pit, and numerous frames and other buildings. The Nursery stock is of the most saleable stuff, consisting of a large quantity of Rhododendrons and Azaleas, of the very best varieties in cultivation, many of his own raising, and not yet in commerce; many thousands of the best varieties of Hollies and other evergreens; about 20,000 Lilium auratum, and a select general Nursery stock. The Nursery is about half-way between Liverpool and Southampton, and ten minutes' walk from the Ormskirk Railway Station. Full particulars to parties wishing to purchase. ISAAC DAVIES, Brook Lane Nursery, Ormskirk.

To Nurserymen.

FOR IMMEDIATE DISPOSAL, a good and well-paying NURSERY BUSINESS, in North London: ten long Greenhouses, 1000 feet of Pipe, with Boilers in good condition, upwards of 10,000 Greenhouse Ferns, and other plants, Trade Utensils, and a useful Horse and Van. Rent of Ground, £10 per annum.

KELF AND SON, Auctioneers, Upper Edmonton.

FOR DISPOSAL, a FLOREST and SEED BUSINESS in a popular and growing seaside town, close to large Market Town in the West of England, about 1 acre of Land with a large quantity of Glass, well heated with hot-water, consisting of large Vinery, Greenhouse, Fernery, Propagating and Chamber-houses, Pits, Frames, &c.; a large Dwelling house, with a fine Shop, in centre of town, next to General Post-office, and doing a good general business. Satisfactory reasons will be given for the disposal of the business. Income moderate.

Apply, PALMER and STILING, Auctioneers and Estate Agents, Bournemouth, Somerset.

FLOREST and NURSERYMAN'S BUSINESS, with large JOBBING TRADE attached.—Two compact Nurseries, about 3 acres in extent, 8 Greenhouses, Stabling, 9-roomed Dwelling House. Good position in important fashionable suburb of London. Total rental £196 reduced to £74 by letting off. Price for Stock, Greenhouses, and Building, £1100 or offer. Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, London, E.C.

TO LET, ST. GEORGE'S GARDENS, St. Annes-on-the-Sea, 12 Acres in extent. Extensive Vineries, Hothouses, &c., Tennis Lawns, and Bowling Greens. The Directors are prepared to receive offers. Possession, March 1, 1893. Particulars on application to W. H. NUTTER, St. Annes-on-the-Sea.

TO BE LET, a compact GLASS NURSERY, very conveniently situated, near a large Midland Town. Stock very small. Entry at Michaelmas. Apply to HARRISON AND SONS, Seedsman, Leicester, Exors. of Mr. T. HARRISON, Sen.

KENT.—MUST BE SOLD. Great sacrifice. MARKET NURSERY, 10 modern Greenhouses, 4 acres of Ground. Personally inspected. Only about £200 cash required. Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

FOR Sale, a Bargain, 300 to 400 feet of 4-inch HOT-WATER PIPES, ELBOWS, and FITTINGS, nearly new. Apply to R. T. BURTON, 15A, Westway Street, Upper Norwood, S.E.

TO NURSERYMEN and FLORISTS.—750 yards of spent MUSHROOM BEDS, for Potting and Hot-beds.—J. R. CRANK AND CO., "Rolyat," East Acton.

FOR ORCHIDS and GARDENERS to Grow Them, apply to SANDERS, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

Hyacinths, Tulips, Crocus, Lilies, &c.

C. G. VAN TUBERGEN, Jun., Haarlem, Holland. Wholesale CATALOGUE now ready, and may be had free on application to—Messrs. R. SILBERRAD AND SON, 25, Savage Gardens, Crutched Friars, E.C. N.B.—Many new, rare, and interesting plants and bulbs will be found in this Catalogue.

SANKEY'S famous GARDEN POTS
* Bulwell Potteries, Nottingham. *

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your 'Garden Pots,' they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your 'Garden Pots,' and still find them the best and cheapest."

end of the drive, are some very handsome specimens of *Abies Lowii*, *Picea pungens*, and its beautiful variety *P. glauca*, and other uncommon species, and in groups are planted the dwarfer *Retinosporas*, *Thuias*, &c. As in many other important gardens in these days, summer bedding with *Pelargoniums*, &c., is not attempted at Quorndon House, but an ample display of colour is secured by beds and borders of herbaceous perennials, among which annuals are sown or planted in patches, and this kind of provision for a display of flowers even until the hard frosts come, is found to give greater variety, to be less dependent on the state of the weather, and in fact, to secure the desired result, and yet leave the houses free from the burden of having to make provision for the bedding plants in winter and spring. The herbaceous plants also do well even where sheltered by the fine Oaks and Beeches with which the grounds are plentifully studded, and where the ordinary summer bedding plants would certainly fail.

The fine set of plant-houses stands within the walled-in garden, and as they form one of the leading features in the gardens under glass at Quorndon, let us at once proceed to

THE ORCHIDS.

Among these the visitor cannot fail to be struck by the growths put on all the species, and especially on the *Dendrobiums*, which Mr. Cooke prefers to grow in baskets suspended from the roof as much as possible. In the first range we entered—a warm range in three divisions; we were immediately confronted by a fine example of *Dendrobium culture*, almost the whole of the first division being filled with plants of *D. Phalenopsis Schroderianum*, in splendid health, many of them producing their beautiful and varied flowers. Some or other of the plants have been in bloom for a long period of time, and many will continue the show throughout the summer. In the next division there are more of the same beautiful *Dendrobe* in flower, as well as some good *D. MacCarthiae*, *D. superbum*, *D. Dearei*, and some of the *Angræcums*, a good collection of which occupies one side of the house. The third division of this range has on the one side a grand lot of *Dendrobium Dalhousieanum*, some of them with scores of bulbs and new growths, which bid fair to beat those that are freshly imported. The other side is occupied by *Calanthes*, excellently well grown.

In the next range, one of three divisions, the roof of the first one entered was bearing scores of fine examples of *Dendrobiums*, chiefly *D. Wardianum*, which possess new growths of from 3 to 5 feet in length, the beauty of which, when clad with flowers, may be readily imagined. Other species are equally well-grown, and one of them, a noble plant of *D. splendidissimum grandiflorum*, has progressed in a degree which it would be difficult to surpass. A year ago last March, Mr. Cooke had it, a free, sturdy plant in a thumb pot, and now it bears several stout flowering growths, and well furnishes the 12-inch basket that it occupies. On the stages beneath the hanging *Dendrobes*, *Cologynes* are found to grow well.

The next house has one side filled with plants of *Lycaste Skinneri* in fine health. Here they are grown in firmer soil than in most gardens, and are fed whilst growing with weak, cow-house drainings, the tender roots creeping over the rims of the pots, showing that they benefit by its application. *Cattleyas* and *Lælias* also are good in this range.

The cool and intermediate-house range has a very fine and vigorous lot of *Odontoglossums*

and other cool-growing Orchids, some of which are in bloom, *Epidendrum vitellinum* making a great show. Here is a noble specimen of the fine white *Cattleya Mendelii*, Quorndon variety, and in bloom: a showy lot of *C. Gaskelliana*, *C. Loddigesii*, &c. One side is occupied by a splendid collection of *Miltonia vexillaria*, and the warmest division with a fine lot of *Cyrtopediums*, *Cymbidium*s, and more *Dendrobium Wardianum* of extraordinary vigour.

NEPENTHES, OR PITCHER-PLANTS,

form an attraction equal to the Orchids, and at Quorndon House, one of the largest collections of these plants to be met with, and all in excellent condition. They occupy two large span-roofed houses, and a warm division in a lesser house is taken up by the propagation and nursing of the young plants. The plan of growing these Pitcher-plants at Quorndon is most effective. The plants themselves are suspended all over the roof, and the staging beneath is furnished with coloured-leaved foliage-plants, whose pots are covered with short green moss. This plan renders the arrangement of the houses artistically effective, and at the same time gives the necessary humid atmosphere in which the plants delight, a desideratum which is also helped by the presence of a tank in the one house, and of an ornamental water, with rockery sides, and in which the red, blue, and white Water Lilies grow in the other.

Glancing through the fresh-looking and brilliantly-coloured specimens, the different forms of *Nepenthes Mastersiana* ×, with pitchers varying from green tinged and blotched with rose, to light red, dark red, or dark crimson, commend themselves as the best kind, viewing it all round, and a far handsomer thing than its parent, *N. sanguinea*. One of the next to command attention is the old *N. Rafflesiana*, with its large green pitchers spotted with reddish-chocolate. Grown as we here see it, it is one of the very best. Then come *N. Curtisii*, *N. Northiana*, *N. lanata*, *N. bicarata*, and, indeed, the whole of the tribe, all of which are here successfully grown, although each has some peculiarities which require studying. This is markedly the case with *N. Rajah*, which is found to require less heat and more light than the others. Were there nothing else at Quorndon House gardens, the finely-cultivated collection of Pitcher plants would be well worth taking a long journey to see.

Next we come to a block of low span-roofed houses, the first of which is filled with grand examples of *Disa grandiflora* profusely flowered; the second of Maidenhair Ferns, the third has a fine crop of Melons; the fourth, *Tuberoses* sending up their spikes; the fifth, Tomatos in full bearing, Ham Green Favourite being the one most in favour; the sixth, the lesser *Nepenthes*; the seventh, *Tuberoses* in full bloom; the eighth grand varieties of *Anthurium Scherzerianum*, and new seedling *Sarracenias*, many of them lovely and distinct things. The best of them is *S. Farnhamii* ×, of which *S. Drummondii* was the seed-bearing parent; its tall pitchers are bright red, the upper portion being spotted with crimson and white, the brilliant colour being as effective as that of a flower.

Tuberoses are extensively cultivated, and Mr. Cooke says that he has their flowers in greater or less quantity every day in the year, consequently much space is devoted to them. At the present time there is one house in full bloom, another in backward bud, a large frameful just showing up flower-spikes, and other batches down to the last potted, which are now only

beginning to grow. All these seem to be done with a certainty of success which makes it difficult to understand how so many fail with these useful and fragrant white flowers.

THE FRUIT RANGES.

The several Peach and Nectarine houses, in one of which the first fruits were gathered on May 24, have abundant crops, many of the trees growing on trellises at right angles to the front of the house. The five vineries are heavily laden with bunches of excellent quality, especially in the case of Bowood Muscat; and the Fig and other fruit-houses are well up to the mark. Outside, the trees are well trained, but Pears are deficient here, as elsewhere, this season.

Outside the houses is a very fine border of seedling Carnations, some of which are marked improvements on the named kinds growing beside them, and the orange, terra-cotta, and scarlet-flakes are very fine and good flowers.

The encroachment of the glass-houses on the walled-in kitchen garden has necessitated the formation of another of several acres in extent, the whole of which is admirably cropped and well kept. Among the many good things there, are two which Mr. Cooke (who is a keen observer, always on the look-out for really reliable things of the best quality) says everyone should grow, viz., Sutton's Marrowfat Pea, and Veitch's Main Crop Onion, both of which he regards as the best for general purposes yet sent out.

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM CHRYSOCEPHALUM, n. sp.*

The *Dendrobes* of the *Pedilonum* section are not in fashion with Orchid amateurs, yet they include a good many of the most striking species of this genus. *Dendrobium viridi-roseum*, Rchb. f., for instance, and its variety *candidulum*, Rchb. f., rank among the best of the whole genus. The plant we have at hand is, in spite of its deep golden-yellow flowers, so similar to the Reichenbachian *D. viridi-roseum*, that we supposed we had to deal with a variety of this old species known since the time of Roxburgh. The habit of the plant, the size, and the structure of the inflorescence are the same in both species. The examination of the flower, however, showed differences—especially of the labellum—of such importance, that we must admit a new species. As the characters of a merely botanical value are pointed out in the Latin description, we need not reiterate the whole once more. The plant was imported by Messrs. Sander & Co., St. Albans, and flowered in the well-known collection of Prince Liechtenstein, at Eisgrub, Moravia. We are indebted for fresh materials to Mr. W. Lauche, chief gardener. *Dr. F. Kränzlin*.

MASDEVALLIA HARRYANA GRAVESLE, Hort.

(See fig. 21.)

A pure white variety of this handsome species is a great rarity; indeed, I was not aware that one was in cultivation until the other day. In its native home the species is said to vary from deep rich crimson-purple through shades of majenta, crimson, scarlet, orange, and yellow, to cream-white, the lighter shades being decidedly the rarest, and only occurring near the upper limit of the species. The

* *Dendrobium chrysocephalum*, n. sp. (*Pedilonum*)—Sepalo dorsali oblongo acuto, lateralibus antice oblongis acutis postice in pseudocalcar ovario c. pedicello æquilongum productis; petalis lateralibus sublatioribus oblongis acutis; labello e basi longe producta cuneato lanceolata obtusata; sepalis quam maxime simillimis, disco omnino lævi (i.e., nec lamellis nec lineis elevatis aut sulcatis, crinibus caracteribusque quibuslibet instructo); gynostemio apice utrinque bicornuto, androclinio postice in apicem longum producto; athera antice retusa, pollinis postice profunde sulcatis curvatis. Caulis teretiusculi læte viridis; racemi multiflori densissime confertissimi capitati; bractæ minutissime pallide. Flores intense aurei, 1–3 cm. longi antice (expansis) 5 mm. diametro, pseudocalcar 8 mm. longum. *F. Kränzlin*.

white variety, to which the above name has been given, and of which a flower has been received through Messrs. F. Sander & Co., of St. Albans, exists in the collection of Henry Graves, Esq., of Orange, New Jersey, U.S.A., and has been named after that gentleman's wife. It was introduced by the late Mr. F. Man, formerly a traveller for the St. Albans firm, but afterwards in business for himself at Orange, New Jersey. The honour of introducing it belongs solely to Mr. Man. Though somewhat faded after its long journey (having been brought over by Mr. Alfred Dimmock, Mr. Sander's traveller), it is still quite white, and evidently a very beautiful variety, which will contrast effectively with the brighter-coloured forms. It may be of interest to mention here that a plant of this species in the collection of Sir Trevor Lawrence at Burford Lodge has just produced a twin-flowered scape, a very rare occurrence with this species. *R. A. R.*

CYRTOSPERMA FEROX *

This is one of the remarkable new plants exhibited by the "Horticulture Internationale" at the recent Temple Show. It is a Bornean Aroid, with long brown leaf-stalks, thickly studded with conical prickles. The blade of the leaf is deep green, hastate, with rather spreading lanceolate lobes. The spathe is greenish-white, recurved, about twice the length of the cylindrical obtuse spadix, which is completely covered with flowers. It is figured and described in the last number of the *Illustration Horticole*, t. 153.

ORCHID NOTES AND GLEANINGS.

ANGRÆCUM SESQUIPEDALE.

I ENCLOSE a photograph of a plant purchased from the late Mrs. Morgan's collection in New York city, and now in the garden of M. S. Kimball, Esq., Rochester, N.Y. It occupies a very light position, suspended near the glass, in a glazed pan; it carried twenty-three flowers of a bold and chaste character. All the Orchids in this collection are under the charge of Mr. Savage, and are grown in glazed pots; they appear to thoroughly enjoy their situation. Over 2000 flowers of *Cypripedium insigne* were open during my visit, and a beautiful show of valuable and interesting hybrids. *Visitor.*

FINE VARIETIES OF ODONTOGLOSSUM CRISPUM.

A large number of plants of *O. crispum* is now in bloom in the houses of A. A. Peeters, of Brussels. We select the following as being especially worthy of notice:—1st, a variety with large brownish-red spots on all the parts of the flower, which underneath is red, tinged with violet. 2nd, sepals and petals pure white, lip canary-yellow, with two round spots of pale golden yellow; the column has two large spots of an intermediate shade of yellow. 3rd, *O. c. guttatum*: flower very large, two petals pure white, sepals lilac, with large central spot of dark red; lip large, covered with a spot, and surrounded by a white border. 4th, lip very curious and handsome, of a remarkable shade of brownish-red, completely surrounded by a narrow white border; base of lip golden-yellow, relieved by the brownish-red which encircles it; column royal purple. The 5th variety might be called *punctatissimum*, all the parts being speckled with violet—the entire flower is of a lilac colour. 6th, the three sepals bear circular spots of lilac-purple. *Ch. D. B.*

CIRRHOPETALUM MEDUSÆ.

The figure of this plant in the *Illustration Horticole*, t. 754, reminds one superficially of a sea

* *Cyrtosperma ferox*, L. Lind. and N. E. Brown, sp. nov., *Illust. Horticole*, t. 153 [verbis paucis mutatis].—Petioli 10–28 poll. longis, aculeatis, atrovirescentibus, rubro-maculatis; lamina 10–24 poll. long., 4–7 poll. lata, hastata, lobis basalibus antico subaequilongis anguste lanceolato-acuminatis, lobo antico ovato triangulari acuminato; pedunculo petiolum subaequante aculeato, atroviridi; spatha 3½–4½ poll. long., 1½–1¾ poll. lat., ovata lanceolata longe acuminata extus nitida fusco purpurascens, nervis ochroleucis intus albis; spadice stipitato spathe tertiam partem aequante albido lilacino tincto; sepalis staminibusque sex; ovario 1-ovulato. Borneo.

Anemone, or a Japanese Chrysanthemum, rather than of an Orchid; but, of course, the floral details and the foliage present not the slightest resemblance to either of the objects mentioned. M. Rodigas avails himself of the opportunity of giving a list of the known species. The species in question was introduced from Singapore as long ago as 1842, but it is well worth calling the attention of orchidists to its singularity. M. Rodigas, we note, derives the name *Cirrhopetalum* from the Greek *kirros*, in allusion to the tawny yellow colour of the flowers. We had supposed it to be from the Latin *cirrus*, a curl or lock, in allusion to the form of the flower-segments. If this latter be the true derivation, we ought to write *Cirropetalum*, though most people write "cirrus," overlooking the fact that *cirrus* is a Latin word of quite different signification from the Greek *kirros*.

VANDA TERES VAR.

A very pretty and delicately tinted form of this showy species comes from John T. Holmes, Esq., Beechen Cliff, Bath. Its chief peculiarity consists in the two lower sepals being pure white, and the upper one coloured rose and edged with white, and the broad petals light rosy-crimson. The lip is also peculiar in its marking. The plant bore two spikes and eighteen flowers, and it must have been an attractive-looking plant.

ODONTOGLOSSUM RAMOSISSIMUM.

Reichenbachia, t. 41.

DENDROBIUM PHALÆNOPSIS.

Originally described by Fitzgerald in our columns, 1880, ii., p. 38, and afterwards in his valuable publication on Australian Orchids. "To grow this magnificent species to perfection, much heat and light are necessary. A Pine-stove suits it admirably; it will also grow freely in a temperature suited to Crotons and Ixoras. It is indispensable for the production of an abundance of flowers that the pseudobulbs should be well ripened—hence light, heat, and air are the great and important factors in its cultivation. It is best grown in baskets or pans—in peat or sphagnum moss—and suspended in the highest and hottest part of the stove-house during its season of growth. When this is completed, the plant should be rested in a lower temperature, but never allowed to shrivel through dryness. In its native home, girt by the sea, and eternally washed by its spray, the plants attain a great size, and bear a prodigious number of flowers, often as many as six spikes on a single stem. They are never really dry for long. This would be impossible owing to the heavy night dews; but their principal growing time is when the rainy season sets in. It rains more or less every day for three months, the temperature all the time being very high. At the end of this time *Dendrobium Phalænopsis* has made growths between 3 and 4 feet in length, and as thick as a man's thumb." *Reichenbachia*, t. 42.

CYRIPEDIUM HYBRIDUM MAYNARDI.

A hybrid from *Spicerianum* out of *purpuratum*, and intermediate in floral characters between its parents. *Reichenbachia*, t. 43.

C. HYBRIDUM POLLETTIANUM.

A hybrid, not to say a mongrel, *C. barbatum*, *C. insigne*, *C. venustum*, and *C. villosum*, all being concerned in its ancestry. Its immediate parents were *C. calophyllum* and *C. ænanthum superbum*. *Reichenbachia*, t. 43b.

ODONTOGLOSSUM NEVIUM

has been confounded with *O. odoratum*, *O. gloriosum*, and one or two others, but may be readily distinguished by its pure white undulate segments covered with numerous purple spots and the yellow disc. What Lindley described as var. *majus* seems to be simply *O. odoratum* var. *album*. *Reichenbachia*, t. 44.

SECOND FLOWERING IN ONE YEAR OF CÆLYGNE CRISTATA.

I have more than once seen letters from your correspondents, that they believed plants they had of *Cælygne cristata* were about to flower for the second

time, but it was thought they had mistaken growth for flower-spikes. At this moment I have a small pan with several spikes well furnished with fine blooms. *H. J. Ross, Poggio Gherardo, Florence, July 11, 1892.*

RICHARDIAS.

THE two new yellow-flowered Callas which have recently attracted considerable attention, are likely to become popular garden plants, as they are large in flower, beautiful in colour, and apparently as easily cultivated as the common white Trumpet Lily. It may, therefore, be worth while to record now what can be learned about them, and also to point out the characteristic features of the several species of Calla already known, of one or the other of which the new yellow-flowered kinds are supposed by some to be merely varieties.

First, however, by way of starting correctly, we must cease to call these plants Callas, that name belonging properly to the Calla palustris of our ditches and ponds. The African Trumpet Lilies, Lilies of the Nile, Arum Lilies, or Callas are all Richardias, a name given to them long ago by Kunth, who with great propriety, as Sir William Hooker says, "separated the genus Richardia of the southern hemisphere from the genus Calla of Linnæus, peculiar to Europe and America in the northern hemisphere." Kunth substituted the name Richardia africana for Calla æthiopica for the plant which had been introduced into Europe from South Africa in 1687, when, according to Miller, it was sent to Commelyn. Miller cultivated it at Chelsea in 1731, and in 1805 a good figure of it was published in the *Botanical Magazine*, where it is described as bearing our milder winters, and as a plant "which, by management, may be made to show flower in almost any month in the year." We all know about this Aroid now. It is not easily killed, but it pays well for good treatment, which for this plant is almost what is needed to produce exhibition Celery, and it is one of the most beautiful and most decorative of all plants. It fills the ditches and narrow rivers of the Cape pretty much as our Arrowheads and Bull-rushes do here. I have seen spathe of it 10 inches long, and leaf-blades 18 inches by 10 inches. Recently, a variety of it called Little Gem, with leaves scarcely a foot high, and correspondingly short flower-stalks, has been introduced. A figure and description of it will be found in the *Gardeners' Chronicle*, December, 1890, p. 755.

R. albo-maculata was introduced from Natal, by Messrs. Backhouse, of York, in 1859, when a figure of it was published in the *Botanical Magazine*, t. 5140, from a plant which flowered in June. It has leaves often markedly sagittate, the blade variable in length, green, more or less marked with irregular oblong translucent spots, thinner in texture than *R. africana*, and with slenderer petioles. The spathe, too, is smaller, and much less expanded than in the older species, its usual size being 5 inches in length by 2 inches in breadth, and its colour is creamy-white, changing to green with age, with a blotch of purple at the base. The spadix is 2 inches long, and yellow.

R. hastata was introduced at the same time as the last-named, by Messrs. Veitch & Sons, of Chelsea, and others. It was figured in the *Botanical Magazine*, t. 5176 (1860), but before this it had been described by Dr. Lindley in the *Gardeners' Chronicle* (1859, p. 788), as "*Calla ? oculata*," from specimens received by Messrs. Veitch from Natal in 1857, to whom it had been sent as "a yellow Calla, which from its smallness and beauty, and being also hardy, will be much prized." It was collected in Basutoland in 1861 by Cooper, and has been received at Kew from other parts of South Africa more recently. It has ovate hastate unspotted leaf-blades, a foot long, dull green in colour, with a long channelled petiole, which sometimes bears a few short soft hairs, especially when young. The spathe is from 2 to 5 inches long, comparatively broad at the base, where it is folded, the upper portion stiff, with an erect filiform tip. Its colour is a dull yellow, with a blotch of crimson at the base, seen only on the

inside; it changes to dirty green with age. There is a coloured plate of this species in *The Garden*, vol. xviii., p. 596 (1880), which represents the flowers of a much brighter shade of yellow than I have ever seen them.

R. melanoleuca was introduced from Natal in 1868 by Mr. W. Bull, of Chelsea, and figured in the following year in the *Botanical Magazine*, t. 5765. It has the habit and appearance of *R. albo-maculata*, but can always be distinguished from that species, even when not in flower, by its shorter leaf-stalks, bearing at the base scattered setiferous hairs. The leaf-blade is from 6 inches to a foot in length, oblong, or ovate-hastate, with a hair-like point, and spreading basal lobes; it is membranous in texture, dark green, with a few oblong semi-transparent white spots following the direction of the nerves. The spathe is 3 inches long, and broad, not folded over at the base, so that the whole length of the spadix, which is an inch long, is exposed. The spathe has a thin elongated point, recurved margins, and is pale straw-coloured, with a large vinous-purple blotch at the base. The leaf-stalks in this species are tinged at the base with red.

R. Rhamni was described by Engler in 1883, and flowered for the first time in cultivation in the Cambridge Botanical Gardens in 1888. It was sent to Mr. Lynch by Mr. Adlam, from Natal, as *R. aethiopica rosea*, but there was no trace of rose in the spathe produced at Cambridge. It differs from all the other species in having a lanceolate, not sagittate or cordate leaf-blade, a foot long, and 2 inches wide. The spathe is 4 inches long, and like that of a very poor *R. africana*.

R. macrocarpa, also described by Engler, and said to be from the Transvaal, is represented with hastate leaves, and fruits nearly twice as large as in any of the other species.

We now come to the new ones. The first of these has been called *Calla Elliottiana*, in compliment to Captain Elliott, of Farnboro Park, Hampshire, who has exhibited it several times in London within the last three years. I have received the following information concerning the plant from Mr. Knight, gr. to Capt. Elliott, in reply to some enquiries I made with regard to this plant. He wrote, "Six years ago this spring I had six seeds given to me by the late Mrs. Elliott, who informed me that they were 'red Arums.' I sowed them, and out of the six only one grew. The first year it developed two unspotted leaves, the next year it produced a spotted leaf, and the third year it pushed up two leaves and a yellow spathe. I did not show it at the Drill Hall till the following spring (1890). From the first flower we obtained eighty-six seeds, from which we raised fifteen young plants, and the plants shown this year in flower were from this batch of seedlings. Last year the plants I showed were the parents (one an offset). The seedlings did not flower till this year, and as the plant came true from seed I did not trouble to keep seedlings and offsets separate, but until the former flowered I did. We took no care of the plant, and it was knocking about amongst odd plants for two seasons, as I thought after I saw the spotted foliage that it was only *albo-maculata*, although wider in leaf, and not so long. All the plants sold in London on June 17 last were raised by me from the one original plant first exhibited at the Drill Hall in 1890. The second year the plant produced sixty-eight seeds."

Whether this plant will prove to be a good species, or only a variety of *R. albo-maculata*, it is certainly distinct enough for garden purposes to bear a separate name. Its recent distribution by auction sale among nurserymen and others is certain to result in its soon becoming available for collections generally. But there is yet another yellow-flowered *Calla*, and moreover, one which, in the opinion of most people, is not only quite distinct from Captain Elliott's plant, but superior to it. This is *Calla Pentlandii*, which was shown in flower at the Drill Hall last month by R. Whyte, Esq., of Pentland House, Lee, and which was awarded a First-class Certificate. Mr. Whyte kindly informs me that he

"did not import the plant, but about two years ago a friend gave me six bulbs, and stated he hoped I might find a yellow flower amongst them. Two of these bloomed last year, but were poor, and only the ordinary type; another flowered this year, and it is the one recently shown as *C. Pentlandii*. I have another plant precisely similar in appearance to the latter; I hope it may flower soon and prove to be the same fine variety."

Mr. Whyte's plant has large dark-green wavy leaves, tinged with dull red at the base of the sheathing petioles, and an erect spathe as large as that of the ordinary *Richardia*, and similar to it in shape, but the colour is a rich Buttercup-yellow. It may prove to be a yellow-spathed variety of *R. africana*. A plant in flower with two small offsets from it, and a second plant as yet unflowered, were put up for sale by Messrs. Protheroe & Morris on the 22nd inst., but although ninety guineas was offered for them, they were not sold.

There are other "yellow *Callas*" in English collections beside the two which have flowered. I know of six which were brought from Africa by a traveller, who said he had obtained them as a special favour from a Basuto chief. I have also been told that some short time ago, a gentleman came from near Natal to offer thousands of them. Of course, these swans may be geese; but, with the plants of *R. Elliottiana* and *R. Pentlandii* to work from, it should not be difficult to make both of them as plentiful in a few years as the White Trumpet Arum is in England now. *W. W.*

FRUIT REGISTER.

APPLE CESKA POCHONTKA (*syn. Delices de Bohême*).

An excellent variety raised in Bohemia by Ed. Roche. It was raised from the Tyrolese Noble Red (*Edelrothen*), fertilised with the Alant Apple. The fruit is of medium size, still, it is one-half larger than the seed-bearer; the rind is shining, white, with yellow flames, and suffused with carmine and crimson; flesh white, of silky softness, shining, with an after-smack of Rosemary and Almond which is not to be found in any other Apple.

The habit of the tree is regular, and it bears every year enormously. This year the first grafts have been distributed.

NEW RED RASPBERRY APPLE.

This is a constant-bearing seedling form of the true red Bohemian Raspberry Apple, which is, particularly by ladies, prized before all others. The fruit is of medium size, rind entirely coloured of a lively crimson and dull red, greasy to the touch; flesh white, tender, of very mild, sweet, Raspberry-like flavour. The tree is a moderate grower, and a regular bearer. Season, December.

APPLE DOMNESCHTA, *syn. GENTLEMAN'S APPLE*.

A variety of Apple from Moldavia, and an exhibition fruit of the first quality, very large—width 4 inches, height 3½ inches—of aromatic flavour and good keeping properties. The tree lives to one hundred years, and forms a gigantic pyramid. In the Government of Kief, where the frost reaches 13° below zero Fahrenheit, this variety suffers no injury; it is, therefore, well adapted for planting in cold and mountainous districts.

APPLE BIELA BORODOWKA.

This Russian variety exceeds the Domneschta in size, and is one of the best of the Russian Apples. The tree is an upright grower, has foliage of a deep green colour, and the fruit, which ripens in September, is light yellow, and on the sunny side suffused with rose colour, and striped with red. The fruits weigh sometimes 1½ Russian pounds. It is a first-rate market fruit, much in request in Podolia, a district famous for its fruits. The tree bears well every year, and is capable of withstanding great cold. *Wiener Illustrierte Garten Zeitung*.

THE MUTUAL INFLUENCE OF THE STOCK AND THE GRAFT.

In the report of the Michigan Horticultural Society for 1891, Mr. A. A. Crozier has a most instructive paper on this subject. He collects together most of the opinions which have been published, together with the evidence upon which these opinions are based. As a rule, the observations here put on record have not been based on direct experiment undertaken for the particular purpose of determining the modifying influence of either the stock or the graft. Many of the statements are contradictory, and much of the testimony has to be rejected. Some of the changes said to have been observed are plainly imaginary, and Mr. Crozier has allowed them to appear simply to show what beliefs have been held. Careful and well-directed experiment will, of course, be necessary before the points involved are settled, and we are pleased to observe that Mr. Crozier himself promises to conduct some of these trials. But, although this evidence reported is not all of very serious value, there are altogether forty pages of quotations published, and a careful examination of them gives abundant proof that both stock and graft do influence each other's growth in very many ways, and Mr. Crozier gives the following conclusions which he has deduced from a careful study of the existing evidence:—

Size and vigour.—The stock and graft each imparts to the other something of its own degree of vigour or lack of vigour. This influence is greater the first year or two than afterward. If the difference in vigour is great, both stock and graft may ultimately perish. The dwarfing, which in certain cases results from grafting does not always arise from a diminished supply of food, but often indirectly from earlier and more abundant fruitfulness.

Form.—The alterations in the forms of trees, as the result of grafting, arise mainly from increased or diminished vigour. This probably applies also to alterations in the form of the roots, vigorous roots having larger, longer and fewer branches than feeble ones. Many of the observed changes, however, in the form of the roots of grafted trees, are probably due to the trees having rooted from the graft. The observed changes in the form of the fruit of the graft, causing it to resemble that of the stock, are as yet too few to be considered other than quite accidental.

Fruitfulness.—The most important of all the results of grafting is increased fruitfulness. This is brought about (1) by the mere process of grafting, which operates in the same manner as a ligature, or the removal of a ring of bark; (2) by diminished vigour through defective nourishment from a feeble stock; (3) by increased vigour imparted by vigorous stocks to varieties which are naturally too feeble to bear heavily.

Precocity.—Earlier, as well as more abundant, fruiting is induced by the act of grafting; also by diminished vigour due to dwarf or feeble stocks. The precocity of trees on dwarf stocks is not, however, always directly due to diminished vigour, but largely to the habit of early bearing imparted to the graft by the stock in a manner not fully understood. Probably the diminished supply of sap derived from dwarf or feeble stocks, and its consequent richer character, is an important factor in inducing the earlier and more abundant fruitfulness.

Season of Growth and Maturity.—The stock and the graft each modifies the period of vegetation of the other when their normal times of beginning or closing their season's growth are different. Thus a late variety grafted upon an early stock begins and ends its season's growth earlier than it otherwise would. This alteration in habit appears in some cases to affect the time of ripening of the fruit.

Hardiness.—There is some evidence that hardy stocks increase the hardiness of the grafts. This, however, does not appear to be by the transfer of any inherent hardiness peculiar to the variety, but to result from the increased or diminished vigour in certain cases, or an earlier maturity in varieties

which, upon their own roots, are inclined to grow too late in the season. The advantage usually sought in hardy stocks is to furnish hardy stems able to resist injury to the bark by sun-scald, &c., and to supply roots of uniform hardness in place of those of ordinary seedlings which are frequently less hardy

could not live if upon their own roots." There is in this fact no evidence that the character of either stock or graft is modified. In some cases, however, the demands of a vigorous or fruitful graft may render the roots of the stock more exacting as to soil, so that they require one which is more fertile

yellow Carrots; (2) by earlier or later maturity, earlier maturity inducing more heightened colour; (3) by the restoration of normal nutrition to a "variegated" stock or scion; (4) by the transfer to a healthy stock of the disease known as variegation. There is little evidence that the characteristic colour of fruits is modified by grafting.

Flavour.—The testimony is abundant that fruits may acquire the flavour of the fruit of the stocks on which they are grafted; this has been especially noticed in the case of sour Apples grafted upon sweet varieties. Other modifications in the flavour and texture of the fruit have been noticed which do not cause them to resemble the fruits of the stock. The operation of grafting itself often causes the fruit to be larger and more succulent, and to ripen earlier; this latter change, when it causes more perfect ripening, improves the flavour. We can say that certain stocks improve the flavour of fruit borne by the graft, while others deteriorate it, and that it is probable that stocks bearing highly flavoured fruits intensify the flavour of the fruit borne by the graft, while stocks bearing fruits which are sweet or mild in quality diminish it; but, notwithstanding the abundant testimony to this end, direct and careful experiments are needed.

Disease.—The evidence is conclusive that certain diseases may be conveyed from stock to graft, and *vice versa*. This applies not only to diseases caused by parasitic fungi, but also to the peculiar form of malnutrition known as variegation. It will be observed that nearly all the best-established changes which are noted are due to altered nutrition, and though they sometimes cause the stock and graft each to acquire some of the features of the other, these alterations extend mainly to such points as vigour, colour, and period of vegetation, and in no case can they be considered to be of the nature of hybridism. *Garden and Forest.*

COMMERSION.

The story of Philibert Commerson, Botanist and Traveller, and Jeanne Baré (1727—1773).

(Continued from p. 90.)

Meantime, Commerson had prepared and forwarded to the Minister of Marine a general programme of the observations in natural history, which he recommended as possible to be made during the forthcoming expedition to the Austral regions, from which so much was expected.

This report was so complete and so well and fully thought out, that copies were preserved in order to serve as guides to future expeditions for similar explorations.

The expedition set sail from Saint Nazaire early in 1767, and in the month of May following the ships arrived at Montevideo. Commerson next explored the neighbourhood of Rio Janeiro and Buenos Ayres. In these localities he remained collecting for three months, and then he proceeded to the Falkland Islands, *Les Iles Malouines*, as they were known to the French at that time. Subsequently the expedition visited Patagonia, Tierra del Fuego, and the Straits of Magellan.

Commerson's observations proved that the Patagonians were not a people of giants, as some navigators, who had only seen them at a distance, had reported in their exaggerated accounts. He, nevertheless, confirmed the statement that their stature was above the ordinary average.

The expedition next visited the islands of the Southern Pacific, and made some stay at Tahiti, of which island Commerson sent a detailed description to his friend Lalande in a letter, which that savant published in the *Mercure de France* of October, 1769. The description differs somewhat from that published by Bougainville.

Meantime, Commerson had been excessively pleased by the exemplary conduct of his faithful servant Jean Baré, who had so zealously and devotedly attached himself to him. This youth was a very model of an obedient, hard-working, good-tempered servant, obliging and sympathetic to that

FIG. 19.—NEPENTHES INTERMEDIA: PITCHERS GREEN-COLOURED, WITH DARK-RED SPOTS. (SEE P. 139.)

than those of most cultivated varieties. Conversely, a hardy graft has been known to increase the hardness of the stock, but known examples of this are rare, and usually no such influence can be observed.

Adaptation to Soil.—"Favoured by the influence of the stock, many species are able to thrive in unfavourable soils, and often in those in which they

or of more definite character in which to maintain in health the grafted tree than would be required for a tree of the same kind as the stock growing in its natural state.

Colour.—An alteration in colour, as the result of grafting, may occur (1) by the direct transfer of colouring matter, as in the example of the white and

extent, that it is even said the animals on board showed a marked preference for him. He was never for a moment ill-tempered, never impatient, and what was remarkable among the Breton sailors, his rougher comrades, never made use of either an oath or any coarse language or expression. His amiability showed itself not only to his master but to all on board, and he was a general favourite. Everywhere he followed his master, and partook of his hard fare and fatigues in long journeys through the jungles, woods, and mountains of the tropics. Even in the Straits of Magellan, in the midst of the inclement weather, snows, and icy mountain tracks, this zealous servitor carried with hardihood and incomparable fortitude his master's scientific apparatus, and the collections which he gathered on the way, his guns, and the game he shot. He started off, and always arrived back so heavily laden that the crew and officers nicknamed him the "beast of burden." His task was not confined either to this bodily labour. Commerson luckily found in Baret a most adept assistant, and a quick pupil, eminently skilful in his practical knowledge of natural history. All the branches and nice details of that science became rapidly familiar to him. The rapid progress which he made, acquiring the facts in this science, and the extraordinary development of his intellectual faculty in assimilating knowledge, and in applying his master's methods of practice, which, of course, were perfectly novel to the young tyro, was constantly a subject of astonishment on board ship.

Everything prospered, and affairs progressed most smoothly for Commerson, thanks to the ready wit and apt obedience and cleverness of his young pupil and assistant. Commerson was saved an infinity of trouble, and learnt to depend upon his faithful companion and young friend, for he was more friend than servant. In this happy manner the expedition proceeded, the topographical features were surveyed and sketched by Bougainville and his officers, whilst Commerson and Baret reaped a rich harvest of natural objects for their unique collection.

One fine morning when the wooded peaks of Tahiti, off which the "Boudeuse" and the "Etoile" were anchored, were reflecting the early morning rays of a tropical sun, Bougainville, several of his staff, with Commerson, and, of course, the faithful Baret, landed. No skilled botanist had ever to their knowledge landed before on this lonely island. Undreamt-of discoveries lay hidden within those tempting forests and valleys under the volcanic mountains of the Queen of the Pacific islands. The natives, friendly and joyous, trooped to meet their exotic visitors, eager to entertain them with every possible hospitality. Bougainville and his followers were charmed by this amiable reception, and everything promised a happy day. Alas! it proved anything but a happy day for one, if not for two, individuals.

Whilst the European tanned sailors, after their long sea voyage, gazed with admiration and contentment at the various strange and rare sights before them, the people, their houses, boats and implements, their clothing and festive garlands of flowers, their innocent and confiding demeanour, the foliage of the plants and trees, &c.; in like manner the natives were taking in with keen observant eyes every detail of face, dress, and arms of their strange visitors from distant unheard-of countries.

All of a sudden, shouts of laughter and derision arose from a group of natives which caused Bougainville and Commerson to turn round in some wonder at the slight tumult in the crowd behind them. To Commerson's infinite surprise, he saw his servant Jean Baret in the hands of a number of inquisitive native women and girls, who, without intending any offensive rudeness, surrounded the frightened lad, and expressed by their unmistakable gestures their discovery that the seeming sailor-boy in reality was one of their own sex, and they claimed her as their companion apart from the men.

Poor Baret, wholly and suddenly taken by surprise, blushing and in tears at the inconvenient discovery,

broke away from her jesting surroundings, and threw herself at the feet of Bougainville and Commerson in an agony of shamefacedness and terror at her exposure, &c., the consequences which she could not foresee. The young woman then confessed to Bougainville and Commerson, imploring their pardon for her deceit. She stated that her real name was Jeanne Baré, that she had been born in Bourgoyne, and had been fairly educated, but was left an orphan with means—of which, however, she was deprived by a law suit—and without friends. As a friendless young woman in the streets of Rochefort, she had no chance of gaining a livelihood in any method at all consonant with her ideas of happiness. Always of an adventurous disposition, she had often as a girl, longed to visit the scenes in foreign countries of which she had read such fascinating accounts; and would, but for the loss of all her modest fortune. The only chance for her was to disguise herself in man's clothes; and accordingly she made up her mind to crop her hair short, and dressing herself in male costume had offered herself as servant to M. Commerson.

Bougainville, Commerson, and the officers were dumbfounded, whilst the crews were astonished as well as amused, and doubtless many witticisms and sarcastic references were made by the rougher mariners before the mast, but the commander and the botanist were equal to the occasion. Mlle. Jeanne Baré was assigned a special cabin on board, and every respect and courtesy paid to her in her new character. Of course, it was impossible for her to resume suitable garments until they reached more civilised quarters of the world; but meantime everybody felt how blind they must all have been not to have noticed the peculiarities of this marine Rosalind, and possibly more than one was wise after the event, and remembered how he had always had his suspicions that Jean Baret was really a woman in disguise.

Poor Commerson was also greatly to be pitied, for the discovery placed him in rather an awkward situation. Fortunately, he was always so single-minded, so frank and honest in all his relations with his servant, that no one could dream of imagining that he had connived at the strategic deception which the *ci-devant* Jean Baret had practised. He now manifested a great pity for the poor woman who had confided herself so devotedly to his protection; and, whilst his regard and respect for her was redoubled, he was careful that she should no longer be treated by him as a beast of burden (*bête de somme*); but he still continued to derive benefit from her assistance in the preparation of objects for his collection, and especially of plants, for his enormous and unique herbarium. He now understood how superior her supple hands and lithesome fingers were for many delicate manipulations of tender objects, to the rougher handling which most ship's stewards would have subjected his lovely fronds and petals of valuable specimens.

This strange *dénouement*, which thus came on all like a thunderclap in a clear sky, did not prevent Commerson from pursuing his botanical researches in the fertile island of Tahiti; nor did it prevent his indefatigable assistant from continuing to follow in his footsteps, and from sharing his privations and his botanical triumphs; only now Commerson took good care that a stalwart marine servant should be told off to accompany the pair, in order both to bear the burdens, under which Jean Baret had formerly staggered, and also to prevent any inconvenient *tête-à-tête*—in fact, to act as chaperon to Jeanne Baré. S. P. O.

(To be continued.)

STREPTOCARPUS.

SOME very pretty cross-bred *Streptocarpus* are at the present time to be seen at Messrs. J. Veitch & Son's Nursery, Chelsea. The plants, which have been planted out in cold frames, were raised from seed sown in December last, have made robust growth, and great progress, considering their age, much more indeed than *Gloxinias* would do in the same period

of time. During the winter no more heat was employed than would keep out frost.

It has been the object of the hybridiser, Mr. Heal, to obtain fresh strains of colour that shall be brighter than that of the first cross-bred *Streptocarpus*, raised at the Royal Gardens, Kew, and at Chelsea, and in this respect, as well as the increased size of the flowers, and variety of the markings of the same, great improvements are evident.

Among the colours may be noted pure white, white with violet lines, magenta with dark crimson spotting, and markings in the throat; mauve, purplish-crimson, light and dark blue, &c. So lasting are they, that the specimens which were so much admired at the Temple Show in May are still well furnished with flowers, and are expected to continue to bloom until autumn. When it is considered that these plants are of the simplest possible culture, it may readily be expected that they will be as largely grown in future as the favourite Chinese *Primula*.

WEST INDIES.

SCHOMBURGKIA HUMBOLDTII.

THIS fine *Lælia*-like *Schomburgkia* is now (March 21) flowering with us. It is growing upon two trees—*Myrospermum frutescens*—in our nursery, where, to all appearance, it is quite at home. The rhizomes are many feet in length, alternated on either side with sessile, channelled, fusiform, hollow pseudobulbs, the latter bearing usually three very stiff leathery leaves of an oval or oblong shape. At the base of the pseudobulbs grow the roots in tufts, which attach themselves very firmly to the bark of the tree, and at their apices are produced the inflorescences which measure 5 feet in length, as shown by the specimens these notes are taken from. The greatest circumference of the pseudobulbs, which lie near the base, is 5½ inches, and the length 10 inches. Towards the upper extremities of the flower-stems are produced the flowers, numbering, all told, about twenty; that is, counting the expanded with the unexpanded ones, but as only about five or six open at the same time and fade shortly afterwards, the effect is not so striking as what it would be if all opened at the same time. The fragrant flowers commence to expand from the bottom; in colour they are lilac, with the lip lilac-purple, and limbriated.

During the past three years and a-half, this species has proved to be a very shy flowerer, although otherwise a rapid grower, and now only three scapes are produced, each from separate pseudobulbs. By referring to Veitch's excellent *Manual of Orchidaceous Plants*, it will be observed that *S. Humboldtii* was "discovered by Humboldt and Bonpland in the beginning of the present century near Puerto Caballo, in Venezuela, and subsequently gathered by Wagner in the same locality." Our plants have been left entirely to Nature for their welfare, being subjected to no artificial treatment whatever, whether with regard to water or otherwise.

Flowering at the same time as this is another *Schomburgkia* frequently met in a wild state in our Trinidad woods, viz., *S. undulata*.

EUCHARIS GRANDIFLORA (AMAZONICA).

DURING the month of February several tubs of this much-admired "Lily" were in flower at the the Trinidad Botanic Gardens. We had placed the bulbs in large size tubs about two years since, previous to which they were growing in open spots about the gardens. Throughout the first year, after being re-tubbed, fine healthy leaves only were produced, followed this year with many scores of scapes, each scape bearing several flowers. The compost used for growing them in consisted of the ordinary potting material—loam, leaf-mould, manure, and sand, and the position in which they grew was one partly shaded from the sun. Such masses of *Eucharis* flowers were, as a matter of fact, greatly appreciated by all who saw them. Tuberoses are also flowering freely (March), but these grow in beds specially prepared for them. *W. E. Broadway, Trinidad.*

VINES, AND VINE CULTURE.*

WE are glad to welcome a third edition of this book, the most comprehensive of its kind. The general plan of Mr. Barron's book is now so well known, that we need not further allude to it; but we may advantageously allude to one or two new features which distinguish the present edition from those which preceded it. Thus, in the chapter on Vine diseases, an account is given of the peculiar affection first noted in Mr. Blackmore's vineries, and which has received from that gentleman the name of diphtheritis, or lorification, the parts affected assuming ere long the consistency of leather, and finally that of wire.

"The first symptom is a contraction of the margin of the half-grown foliage till the leaf becomes like a cup inverted, then the stem loses its crisp, clear substance, goes dull, and is channelled with lines of shrinkage; the tips of the shoots become flat and flaccid, all the gloss is lost, and the vigour gone;

We presume this latter statement simply means that red-spider was discovered on the shoots, for the appearances are not those usually produced by that arachnid. The mere cursory inspection of a diseased shoot is by no means adequate in such a case as this. The prolonged and careful examination by an expert provided with all modern appliances, and familiar with all modern methods of research, is required before any definite opinion can be formed as to the cause of the disease. Meanwhile, treatment must be purely empirical and tentative. If we remember rightly, the treatment adopted by Mr. Blackmore was one which would favour the development of fungi, and so far this affords evidence that the disease was not caused by those agents. Eliminating other sources of disease as all more or less improbable, in this instance there remain those refuges for the ignorant—bacteria. We would suggest that an examination be made to see whether these creatures are existent in the diseased Vines, and whether the disease can be produced by the artificial

the same treatment. Houses erected for Grapes are at first cropped with Tomatos, which, producing an immediate return, help the growers to tide over the first two or three years whilst the Vines are getting established." As an indication of the extension of Grape culture, it may be noted that on one day in October, 1891, 4 tons, equal to 750 baskets, of Grapes were sold in Covent Garden.

If we enquire where all these Grapes come from, we find that one firm alone in the vicinity of London has 25 acres covered with glass, and devoted to Grape-culture, yielding, on the average, 300 tons per annum, which at 2s. per pound, produces a gross return per acre of £3360. Messrs. Rochford, to whose establishment these figures refer, have not one or two, but many competitors round London, while very large supplies come from Worthing, Southern Scotland, and the Channel Islands. From Guernsey, in 1886, 500 tons were sent to Covent Garden, a quantity considerably increased since then, and supplemented by large supplies forwarded direct to

FIG 20—SARRACENIA POPEI X: PETALS, VELVETY CRIMSON, WITH YELLOW EDGES. (SEE P. 139.)

and the disease descends from leaf to leaf until the whole tissue is hardened, and the young wood becomes of a dirty black tint. The growth of the season is stopped, and the main stem, instead of gaining in bulk, is lessened. Young Vines alone, so far as our present knowledge goes, are affected by this disorder; but they seem to take it alike, whether grown in pots or planted in their places. The roots appear to be perfectly healthy, the growth is robust and vigorous; the house has been managed as usual, there are no cold draughts or sudden changes, defects, or excesses of temperature; but suddenly this disease appears, and Vine after Vine is afflicted. This mainly is contagious, or at any rate, epidemic; the symptoms seem to be distinct from all the recognised forms of mildew, and cannot be checked by the use of sulphur—yet further investigation may prove that it is of fungoid origin. Some Vine shoots suffering from this complaint were brought before the Scientific Committee of the Royal Horticultural Society about three years since, and that learned body attributed the mischief to red-spider."

* *Vines, and Vine Culture*, by A. F. Barron. *Journal of Horticulture*, 171, Fleet Street.

transference of these bodies to a healthy Vine. A department of Vegetable Pathology, such as exists in America, in France, and in Germany, is one of the great wants of our country. For reasons already assigned, the investigation of these obscure maladies by any but trained specialists is becoming less and less useful. In the meanwhile, we may mention that we have so far only seen the particular disease which suggested these remarks on Mr. Blackmore's Vines, and in one Vine at Chiswick.

In dealing with the Phylloxera at Chiswick, the method suggested by the Scientific Committee was successfully carried out. "The house being closely shut up, sulphur was burnt until every plant was killed by the burning fumes, then the plants were burned, and every bit of soil, also the drainage, carted away, and the whole of the frame-work of the house repainted; this proved absolutely successful, and has been followed by others with equal success."

In the chapter on commercial Grape growing, it is shown how enormously the production of Grapes for market has increased. Mr. Barron attributes this in part to the introduction of late-keeping Grapes, and partly, "chiefly," he says, to the extension of the demand for Tomatos. "Both crops requiring much

the large provincial towns. It is the large growers who have the business in their own hands, the returns for small quantities being barely sufficient to pay expenses. We hear so much of American and colonial competition in the matter of fruits, that it is satisfactory to learn that a great trade in English winter Grapes seems likely to be established with America. The Grapes travel well, arrive in good condition, and prove of superior quality to American produce during the winter season.

Mr. Barron's book, then, is not only important as the record of the experience of a long-tried cultivator of acknowledged high repute, but it furnishes incidental evidence of the important position which horticulture now occupies in the commerce of the country.

THE GYPSY-MOTH.

ONE of the most destructive insects on record is the gypsy-moth (*Ocnera dispar*) which for the last three or four years has been devastating large areas. It has been found in more than twenty townships in Massachusetts, embracing a territory of 200 square miles. With characteristic energy and thoughtful

system in the presence of a public evil, the old Bay State established a commission of capable men—experts and practical workers—and equipped them with ample means (50,000 dols.) for fighting the pest; an example which might well be followed in other States.

Their efforts were so well directed, that the spread of the gypsy-moth seems to have been effectually checked. When the caterpillars appeared, a large force of men and teams was employed to spray the trees infested, with Paris Green and other mixtures. Thirty teams with large spraying outfits were in use. To prevent the transportation of caterpillars by teams, a large force of police was employed to guard the roads leading from the infested territory; but it was found impossible to make their work effective, and a code of rules was adopted, which we epitomize:—

All persons were forbidden by law to remove the gypsy-moth, its nests or eggs, from one place to another, in any city or town, and requested to exercise care against so transporting the gypsy-moth on teams and carriages.

All persons were forbidden to remove any hay, manure, wood, bark, trees, rags, lumber or shrubbery of any kind, without a written permit from the department. All loads must be covered with canvas.

All vehicles leaving the district might be stopped and delayed until their contents were inspected.

No person might remove the bark from trees, nor attempt to scrape and clean them, without first notifying the department, and having said trees thoroughly inspected, and, if found infested, cleaned under its direction.

Owners or tenants were requested to gather and burn all rubbish and useless material upon their premises that might provide nesting-places for the insect, and to fill with cement or other solid material holes in trees upon their premises.

Windows of houses were protected by screens during the summer months, as the insect lays its eggs in the houses wherever it can gain admittance.

Fences and buildings could be torn down if necessary, and the owners were to be recompensed by the State.

When spraying ceased, every effort was made to destroy the creatures during the short time they remained in the pupa and moth stages. The men were then set to gathering and destroying eggs. An effort was made by the men employed to go systematically over the entire infested territory, gathering and destroying the eggs of the moth. The progress was necessarily slow, as every tree, shrub, wall, fence, pig-pen, hen-house, shed, and even the dwelling-houses and barns in the most thickly-infested territory, had to be carefully examined by the men, and afterwards inspected by the most expert among them. Old stone walls were burned out by the use of crude petroleum. The oil was forced among the stones in the form of a spray by the use of pumps and spraying-nozzles. Large tracts of land covered with brush were burned over, after the brush had been cut and sprayed with petroleum, and in some cases woodland was cut and burned over after the wood worth saving had been examined and removed. Wherever worthless hollow trees were found infested, they were felled and burned. In this way vast numbers of moths and their eggs were destroyed during the season.

As it was observed early in the campaign that the distribution of the caterpillars was effected largely by their falling from the trees upon teams, an effort was made to destroy all eggs upon trees on or near the highways. Before the hatching of the eggs many large street-trees were banded with strips of tarred paper as a means of protecting them from the gypsy-moth and canker-worm. This remedy proved very effective. Great numbers of eggs had been deposited on buildings, fences, and other objects near the trees. As soon as the young caterpillars left the eggs, instinct led them to the trees, and, as they crawled upward to find food, many were entangled in the cotton-waste under the tarred paper and perished.

Paris Green gave better results than any other mixture. When it was properly applied to plants, all newly-hatched caterpillars that were fed upon them died within a few days. Glucose was added to the mixture to retain the poison upon the foliage.

The work carried on last season was so effective that all large colonies of the moth were destroyed. Where in past seasons the trees bore neither leaves

nor fruit, last year a good crop was realized. Where last season thousands of eggs were seen upon the trees, now very few can be found. There is still a large area in which the eggs have not been destroyed. This will have attention during the present season. The above-cited Massachusetts experience outlines the methods necessary to destroy this pest, so no time need be wasted in experimenting. The great importance of concerted action may also be noticed. *American Gardening.*

NOTICES OF BOOKS.

THE RESCUE OF AN OLD PLACE. By Mary Caroline Robbins. (Houghton, Mifflin & Co., Cambridge, Mass., U.S.A.)

This is a pleasantly-written book (first published in chapters in *Garden and Forest*), and which describes, as the title suggests, the gradual transformation of a long-neglected farm in Massachusetts to neatness and fertility. The patient work expended on the place was in time rewarded, and it is really tempting to read about the re-claimed salt-meadow, the orchard, the shady Pines and Willows, which were at last established round the home. The hard struggles with weeds, web-worms, chafers, and other vegetable and animal foes, are related with much spirit, and the volume before us should take a high place in the class of literature to which it belongs. It is attractively got up on good paper (with very wide margins), well printed, and strongly bound.

A HISTORY OF HAMPSHIRE, INCLUDING THE ISLE OF WIGHT.

Mr. T. W. Shore's work under this title published by Elliot Stock, 62, Paternoster Row, may be recommended to those visitors to the coast to whose intellects a band and a march up and down the parade do not furnish quite sufficient interest.

The author shows how the history of the county has been, and is still, dependent on its physical features. These are only indicated, but in successive chapters, the author treats of Hampshire in pre-historic times, in the time of the Celts and Belgae, and subsequently in that of the Romans. With the advent of the Saxons direct evidence takes the place of indirect, and Mr. Shore gives a brief summary of the history of the county in those early days. Then came the Danes, followed by the Normans, so that the history of the county is traced down to the time of the great Charter. In subsequent chapters the author deals with the local and social features of the county, and the influence of the religious orders. The manorial system, its rise and decay, forms the subject of an interesting chapter, and it is recorded how the ancient system of local administration is passing away. In one instance, the court met, found as usual, nothing to do, but also found no dinner provided. The meeting dispersed, and the court has not since been held. "Thus ingloriously," says the author, "has perished one, if not more of the ancient courts of Hampshire, which had met annually for, perhaps, a thousand years, and which under the ancient condition of rural life had no doubt often safeguarded the rights of the inferior tenants."

Special sections are devoted to the Isle of Wight, and to the principal towns, such as Winchester, Southampton, Portsmouth, and Basingstoke. Detailed criticism of such a book is out of place in these columns, but in indicating the nature of its contents we have at least shown how great, and how varied are the sources of interest attaching to them, and we may now add, how great has been the skill of the author in arranging his manifold material.

VEGETABLES.

CARTER'S "DAISY" PEA.

AFTER a second year's trial, my opinion of this new dwarf Pea is much strengthened. It is the largest-podded dwarf Pea with which I am acquainted,

the pods this year being nearly as large as those of Telephone growing on the same quarter, and each one opened contained ten good-sized Peas of a pale green colour, and excellent quality. It is a second-early, and a prodigious cropper, and owing to its being of a dwarf habit, it should find favour with those persons who experience difficulty in procuring tall Pea sticks. This Pea is said to attain, in average soils and seasons, to a height of 12 to 15 inches, but in liberally-manured trenched ground, and heavily mulched, the haulm is a few inches higher. *H. W. Ward.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Peatrice Castle, Swansea.*

EUCHARIS AMAZONICA.—Few plants are so useful as the several species of *Eucharis* grown in gardens, and especially the one that heads this note. With a sufficient number of the plants in the possession of the gardener, blooms may be obtained during the greater part of the year. Any pots full of roots which have recently flowered, and are again required to bloom towards the end of the present year, should now be induced to make vigorous growth. The most suitable temperature at this season is an intermediate one, and when the weather is favourable, allow the plants plenty of air, and avoid an atmosphere that is over-moist. Plants which have attained only a moderate size, and are in want of more root space, should be put into larger pots, which may be done at any time, as the only disturbance of the root will be the removing of the old drainage. When it is wished to divide large specimens, perhaps spring is the best time for the operation, but no hard and fast rule may be laid down; and the best time is when the leaves have attained to their full size, and are fully matured, and the plants have been at rest for some little time. During the operation, great care should be taken to break the roots as little as possible, and the most expeditious way to divide the bulbs, is to turn the specimens out of the pots, then plunge the ball into a tub of tepid water, afterwards working away all the soil from between the roots, and very little harm will result to the roots. As they delight in rather a shady situation, avoid exposing them to too much light, especially for a time. Mealy-bug is very partial to this plant, and it is necessary to frequently examine them, when the leaves should be thoroughly sponged.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE MEXICAN HOUSE.—The flower-spikes of our *Vanda cœrulea* are now growing apace in a warm and light position in the Mexican-house, which is allowed to be highly warmed by sun-heat, and air circulates freely by day, the night temperature falling at times to 55°. The plants are freely syringed every evening like the other inmates of the house, and the amount of air admitted is then reduced, provided the weather has been bright. That this treatment is a suitable one is proved by the activity of the roots, the sturdy flower-spikes, and the absence of spots on the leaves, which are sometimes observed when *Vanda cœrulea* is cultivated in an ill-ventilated, warm, or shady place. By the side of *Vanda cœrulea* I have made room for *V. Amesiana*, our plants having failed to grow satisfactorily in the cool or intermediate-houses, the leaves slowly but surely decaying from the apex downwards, but in the sunshine and buoyant atmosphere of the Mexican-house this mischief was arrested, and the plants seem to be at home. *Vanda Kimballiana* still flourishes, suspended near the roof-glass of the cool-house, and we still keep them there. The flower-spikes of both of these species are now showing.

THE DENDROBIUM HOUSE.—Some of the earliest of the *Dendrobiums*, as *D. Wardianum* and *D. crassinode*, were finishing up the new pseudobulbs, and at this stage their removal to a cooler and more airy house is advisable, such as the Mexican-house affords. Here they should remain for a few weeks longer, that is until the tops of the new pseudobulbs are completely formed, when still more cool and airy quarters, as for instance, a vinery or Peach-house, where the Vines, &c., are resting. *Dendrobium Ainsworthii* and *D. nobile* frequently start into

growth a second time; the growth proceeding from the base of the newly-made pseudobulb before its growth is quite matured, which is not desirable in any *Dendrobium*; but in the case of the two named, no alarm need be felt, for if the plants which behave in this manner are kept actively growing till the principal pseudobulbs are matured, the resting period that will follow will soon put a stop to all further growth, and the secondary growths will form short pseudobulbs.

THE SHOW-HOUSE.—The flowers of *Oncidium Schillerianum* are not large, and they are not showy, the colours being merely two shades of yellow marked with light brown; but when flower-spikes fully 3 yards in length, bearing flowers its entire length, on small branches about 2 inches apart, are seen trailing over other plants, they present a striking picture of beauty. *O. longipes* is a pretty, compact Orchid, and free-flowering, that should be grown in the intermediate-house in clumps in shallow pans or baskets, as may *O. Curtisii*, which is now in flower. *Epidendrum nemorale* is a light and graceful Orchid, which, if arranged with other Orchids in bloom, is very effective. Some of our plants of *Epidendrum vitellinum majus* have been growing in the coolest-house, and some others in the Masdevallia-house, and in point of strength the latter are the better, many of the flower-spikes having from twenty to twenty-five flowers each. *Lycaste Skinneri nivalis* is a small, neat-growing plant, of about half the size of a typical *Skinneri*, and very free to flower—in fact, it is in flower for six months. *Lycaste aromatica* is very desirable at this part of the season, and both this and *L. Skinneri nivalis* are at home in the intermediate-house; but in order to flower *L. aromatica* well, it should have a long period of rest near the light. Then there are the *Cattleya Gaskelliana* in variety, *C. gigas*, and *C. eldorado*, and some other Orchids in flower, which make this house very enjoyable.

THE KITCHEN GARDEN.

By G. WYTHES, Gardener, *Syon House, Brentford.*

WINTER CROPS AND CROPPING.—The planting of winter vegetables should be proceeded with rapidly on ground that was cropped with early varieties of Potatoes, which are now being cleared off; previous to planting, having the ground cleaned of weeds and rubbish, and particularly of all Potatoes, even the smallest. In large gardens, it is desirable to leave as much of the land uncropped and fallow as can be spared, so that it may be got into thorough condition for next season; and the present is the time when it can be best determined what ground shall be left fallow. Deep digging and manuring can be better carried out when a portion of the garden is treated in this manner each year. Ground occupied by old Strawberry plantations can now be turned to account, and planted without digging it. Broccoliis do well on such land, making sturdy growth, with short stems if not crowded together, which stand hard weather without loss. I do not advise using ground that has not been dug or trenched for a long time, as this would be too much impoverished, but when the short or two-year system of growing Strawberries is adopted, it may be so employed, thoroughly manuring and trenching it when the winter crops are cleared off. The advantage of having a good breadth of late Broccoliis is, that the late-planted lot will often afford the best returns, owing to its escaping injury from frost, whilst the earlier planted, owing to its making more growth and a longer stem, is cut down. We lost all ours in the last two winters; but Broccoli Model planted at this season gave us nice small heads, fit for the best table till Cauliflowers came into use.

BORECOLE.—This needs much the same kind of treatment as Broccoli, and is about as useful late in the spring, when other Brassicas are running to seed. The Dwarf Late Curled Asparagus and Cottager's Kales are good to plant at this date; *Chou de Burghley* is another useful winter vegetable; it is mild in flavour, and a good breadth of it should be grown.

CABBAGE.—Another sowing of Cabbage seed should be made from August 1 to 10, which will often be found to give the finest returns, the earlier sowings in sheltered gardens often getting too large, and sometimes bolting. *Ellam's Early* and *Veitch's Matchless* cannot be beaten for earliness and freedom from bolting. When Cabbage is sown in July, as previously advised, I prefer to have the plants pricked off into firm ground as soon as they are large enough

to be handled, and lifting them carefully. This prevents spindling, and when they are large enough for putting out in the quarter, they are sturdy and possess plenty of roots. A large bed of hardy green Colewort planted now on a north border will give a good head late in the spring, and keep up a supply of Greens till the earliest Cabbages come in. The planting of winter Green crops should be finished as soon as possible, including a late lot of Brussels Sprouts, which will often come in very useful, being dwarf and not so likely to be injured by frost as the earlier-planted Sprouts.

LEEKs, late-sown and planted, may be put closer together, and if the roots are not large enough for every purpose, they are of use for flavouring, and are not liable to run to seed so soon as larger and earlier roots.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, *Castle Howard, York.*

TOMATOS.—Plants which may be carrying heavy crops of fruit will need some additional compost put over their roots, which may contain a fair amount of Thomson's Vine and plant manure and leaf-mould. This will answer if made fairly firm when put on, and afterwards well watered. An occasional sprinkling of kaint on the border will also be conducive to growth and bearing. Continue to go over the plants at intervals, to remove all the laterals on those plants which are not intended to furnish cuttings. To secure strong plants for early planting next year, the lateral growths on those now in full bearing should be encouraged, that they may be available for propagating purposes in the beginning of next month. Although I have grown most varieties under glass, none has equalled *Perfection* and *Sutton's A 1* for handsome fruit and heavy yield. I would therefore recommend cuttings being taken from plants of those varieties which are showing free-fruiting qualities. With foggy weather, the fungus which attacks the leaves of Tomatos may make its appearance in unheated houses, and careful inspection of the plants should be made daily, and, on its appearance, the leaves, on both sides, should be dusted with flowers-of-sulphur, and as dry and buoyant an atmosphere maintained in the structure as circumstances will permit of. The white-fly is sometimes a little troublesome, but this can be kept in check by fumigating the house about twice a week until they have disappeared. I have always used medicated tobacco-paper for fumigating, because it is safe, and does its work effectually, which, unfortunately, is not always the case with all fumigating substances.

CUCUMBERS.—Stop and tie-in shoots of Cucumbers as growth advances, and give a good top-dressing to the beds or borders when the roots make their appearance at the top, applying liquid manure freely to plants in full bearing, and fresh linings to those in pits or frames when the heat begins to decline too much. The late cold weather has obliged gardeners to make pretty constant use of artificial heat in houses, and red-spider is very prevalent in some gardens. To keep red-spider in check—it cannot be quite destroyed if it have a good hold of the plants—sprinkle the leaves every night with soapy water, and wash it off the following morning, continuing this practice until the plants are fairly clean.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, *Mereworth Castle, Maidstone.*

RASPBERRIES.—These being now in full growth, should have the weaker canes cut out, the best-placed and strongest being reserved for fruiting next year, making them secure by fastening them to the trellis or stakes, or to each other. Those Raspberry plants that were planted last autumn and cut down nearly to the ground, should be regulated according to their strength. If the canes are weak, pull all of them up, excepting three or four to a stool. Neglect of this point will make all the difference between a good or a bad crop next year. Keep the plantations free from weeds, and should the soil be caked, loosen it with the draw-hoe. As fast as the fruits are cleared off the canes, go over the beds, and cut out all the canes which have borne fruit this season, and mulch the ground if the young canes are not growing strongly, especially on light dry soils. Amongst the many varieties in the catalogues, the best reds are *Baumforth's Seedling*, *Superlative*, *Northumberland Fillbasket*, and *Carter's Prolific*, also *Semper fidelis*, the latter rather acid, but an

immense cropper, and good for making preserves and vinegar. The best autumn fruiter is *Belle de Fontenoy*. The best yellow October and Antwerp. The Raspberry, being a shallow-rooting plant, and to enable it to bear for a reasonable length of time during dry weather, water should be freely afforded, and occasionally artificial manure or farmyard manure-water diluted with one-half or one-third clear water according to its strength.

Autumn Fruiters.—A few of these should be grown, but the flavour of the fruits owing to their ripening late in the year is rarely very good. If fruits for dessert are required, freely thin the canes, which if strong, may be left to the number of five on each stool, and these should be trained to stakes or wires.

WALNUTS.—Nuts for pickling should be gathered whilst they are tender, and when quite dry. A good way of testing the fitness of the nuts is to pierce them with a needle, and if the shell is soft, they are ready for pickling.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, *Longford Castle, Salisbury.*

BORDER CARNATIONS.—The usual method adopted in the propagation of Carnations and Picotees is by layering the young growths in prepared soil in the early part of August. If a small quantity of sifted loamy soil be placed around and close up to the root-stocks of the plants, surfacing it with sand, the layers will root quicker than in the soil of the border. In layering, remove a few of the bottom leaves with a sharp knife, and cut the shoot half-way through, just below a joint, where the shoot has acquired some degree of solidity, and cut in an upward direction for about 1 inch, then bend the stem of the plant down to the prepared soil, inserting therein the tongue formed by the upward cut, and secure the shoot with a hooked peg. If the grass of the shoot layered is topped, it will hasten the emission of roots. In this way a few hundred layers may be made by an experienced hand in a few hours; care, however, should be taken not to cut the stems too deeply, or break them. When a number of layers have been made and fixed securely, water them with a fine-rose water-can, and afford water every afternoon if the weather be dry, till roots form in good numbers. Thus treated, the layered shoots will be sufficiently rooted by the end of the month of September to be safely detached from the plants, cutting them off at the joint at which they were layered, and taking them up with a compact mass of soil and roots, and either potting them in 3-inch pots and standing them on sifted coal-ashes in a cold pit or frame near to the glass during the winter months for transplanting out-of-doors early in March, or be planted out at once.

CUTTINGS, OR PIPINGS.—Where pipings of varieties are obtained from a distance, as is frequently the case at this season, the following simple and effectual method of procedure may be employed to strike them. Place one or more hand-glasses, according to the number of cuttings to be put in, over a bed of fine sandy loam and leaf-mould, with a surfacing of sand a few inches deep. Into this dibble the cuttings, 2 inches apart every way. The pipings should be about 3 inches long, the lower pair of leaves being carefully removed by a sharp knife, and the end cut square across a little below the joint before being dibbled into the soil, afterwards watering them gently. Keep the light, or lights, close, and shaded from bright sun, until the pipings are rooted, when the shading must be no longer used, and a little fresh air admitted, gradually at first, and increasing the amount until the rooted cuttings are either potted up or planted out on a west border. If large quantities of plants are to be raised from cuttings, a shallow frame should be placed on a gentle hot-bed, placing therein sufficient half-rotted dung, and 3 or 4 inches deep of fine soil, so as to bring the surface of the bed to within a like distance of the glass, covering this with sand to the depth of half an inch, and then dibble the cuttings in it as described above, pressing the soil about the individual pipings in putting them in with the dibble. The frame should be kept close and shaded during the heat of the day, admitting a little fresh air for twenty minutes every day to dispel moisture.

ROSES.—Cuttings of the various sections of the Rose desired to be propagated may be readily struck in the same manner as Carnations, if taken off with a "heel," that is, a piece of the old or ripened wood, and a leaf at the base, and removing the central leaflet on each leaf.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, AUG. 5.—Dundee Horticultural.

SHOWS.

MONDAY, AUG. 1. Earl's Court Exhibition, Show of Carnations, Cottagers' Produce, &c. (three days).
Beddington and Carshalton, Maudsfield Horticultural, Northampton (two days).

TUESDAY, AUG. 2. Leicester Horticultural.
Oxford Carnation and Picotee Union, in Stanley Road, Oxford.

SALE.

FRIDAY, AUG. 5. Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—63°.2.

A Connoisseur's Kitchen Garden.* To change market customs is, as everyone knows who has tried, almost an impossibility; to overcome prejudice when endeavouring to introduce a new article of diet is almost as difficult a feat. Our fathers have told us of the long struggle that the introducers of Rhubarb had to maintain, and in our own times we can scarcely recollect a single new food-plant which has found its way as a regular thing to our markets or to our tables. Of course we are not speaking of new, or so-called new, varieties of old vegetables, but of absolutely new products. It would be difficult to name more than a score or two of vegetables in common use out of the hundred thousand or more species known to botanists. Can it be possible that out of that large number, even when all the necessary allowances are made, there are only two score which are fit for use in this country? The Chinese, say the authors of the book before us, eat everything. It would be more easy to enumerate the vegetable products which they do not eat than it would be to specify those that they do. "So much the worse for the Chinese," some may say, calling to mind the succulent Cabbage and the toothsome Asparagus of Europe. Still there must be some *via media*, if we could only find it, between our extreme eclecticism, and the indiscriminating omnivorousness of the Chinese.

To us it seems that apathy, ignorance and prejudice form the chief obstacles to the introduction of greater variety among our culinary vegetables. The ordinary gardener, or he who has to get his living by supplying the markets, is, of course, not to blame for this state of things.

It is his business to supply things of known quality, and which can be depended on commercially. The blame lies mainly with our horticultural Societies, which exhibit a singular lack of enterprise and initiative, and are content, year after year, to go on premiating the same Cauliflowers and Turnips, and to award Certificates to different varieties of Peas, so like, that the seed might readily have been derived from the same sack—the same pod, even.

Colonial horticultural Societies are even more to blame; instead of availing themselves of the native products, and developing and improving them, they hanker after the Peas and Beans and Potatoes of the old country, take much pains and go to great expense to grow an article which from the more or less unpropitious circumstances of the case must be deficient in quality or quantity, or both, and neglect what is at their hand.

The work before us is a second edition of a book well calculated to diffuse knowledge and stimulate enterprise. A certain amount of success has followed on the efforts of M. PAILLEUX to introduce new vegetables; for instance, the rhizomes of the *Stachys Sieboldi* are now grown in such quantities in France that they may be bought at a low cost in the markets of the principal towns. When some other Japanese products were first brought under our own notice, we distributed them among a few of the best-known exhibitors and growers of vegetables. They were received with utter indifference, and in no single instance has a report been received. We are therefore in a position to appreciate the energy of M. PAILLEUX, and we heartily wish him success in his endeavours to introduce valuable culinary plants into the French colonies through the medium of the Botanic Gardens, and to enrich our European gardens with such of the products of other climes as may be suitable for cultivation here.

Reverting to the *Stachys*, we may supplement what the authors tell us by referring to Mr. HEMSLEY'S account in the *Journal of the Linnean Society*, vol. xxvi. (1890), p. 301, and to the figure and comment in our own columns on January 7, 1888.

The present work may in some sense be considered supplementary to VILMORIN'S *Les Plantes Potagères*, supplying information more especially about rare or little-known vegetables.

The work is arranged alphabetically, according to the French popular names—a plan which, however convenient in France, is very much the reverse in any other country. What Englishman, for instance, knows anything about "Accoub de Syrie?" Fortunately, the Latin equivalent name is also given, and there is a good index, so that the botanist of any country would have no difficulty in finding what information he required about *Grindelia Tournefortii*.

The last entry in the book is entitled "Zétoutt," by which is signified the bulb of *Iris lusitanica* or *I. juncea*. The bulbs are eaten by the Arabs in Algeria, and might possibly be cultivated with profit elsewhere. We have picked out the first and the last plants mentioned in the present volume to indicate the nature of its contents. Between the two a great variety of plants is mentioned, and information given as to their native country and uses. It is certain that if these plants are to be turned to good account they must be systematically cultivated, else the supply will be precarious and the quality indifferent.

There is a good index, and all that we can suggest as improvements in a future edition is that lists shall be given in which the names of

the plants should be arranged in their natural orders, and also according to the parts made use of, bulbs, tubers, &c.

ROTHAMSTED.—The United States' Department of Agriculture has issued, in the form of a "bulletin," the report of six lectures delivered by Mr. R. WARINGTON before the Association of American Colleges and Experiment Stations, in August, 1891, under the provisions of the Lawes Agricultural Trust. The lectures comprise a brief historical account of Rothamsted, its owner, and of the experiments carried on by him. The second lecture is devoted to the circumstances which influence the rise and fall of nitrogenous matter in the soil, the sources of the nitrogen, and the causes which determine its loss. Nitrification forms the subject of the three following lectures, and the dependence of the process on living organisms (microbes) is well discussed. As this is a subject to which Mr. WARINGTON has himself paid special attention, this summary of his observations and experiments will be welcomed. The sixth lecture is devoted to drainage and wellwaters. In conclusion, Mr. WARINGTON states, in language which we should like dinned into the ears alike of our educational reformers and of our cultivators:—"You have, I believe, at the present time in your country more than fifty stations, each of them endowed with an income equal or surpassing that possessed by Rothamsted. We have in England one station; you have more than fifty. What a great future lies before you! But, if at the end of fifty years each of your stations is to show a record of work done equalling or surpassing that accomplished by the old station in England, it will only be, I think, by each pursuing its work in the same spirit of accuracy, thoroughness, and patience which has characterised the Rothamsted experiments."

"INVENTION."—In the journal of this name for July 16, was published a cartoon containing portraits of several of the exhibitors at the horticultural exhibition at Earl's Court, together with biographical memoranda.

ARISTOLOCHIA GIGAS.—Mr W. B. LATHAM, of the Botanical Garden, Edgbaston, Birmingham, writing on July 25, informs us that "the marvellous flowers of the vegetable world are now opening here. I have just taken the measurement of a flower which may be interesting to the readers of the *Gardeners' Chronicle*; it is as follows:—Flower 14 inches across (in position), 19 inches long; tail to flower, 37½ inches; entire length of flower, from perfoliated bract at the end of the germen to end of the tail, 60 inches. The flower is drooping, and bent back like a syphon, and has been likened to a pelican; and it is seen to advantage in the bud stage. The centre of the flower is of a black-purple colour, with prominent veins radiating to the margin, mottled throughout with purple on a white ground." We are indebted to the authorities of the Royal Gardens, Kew, for the reintroduction of this remarkable plant after it had been lost to cultivation for many years; and also for presenting a plant to this Society, and by so doing giving the people of the Midlands an opportunity of seeing this wonderful West Indian plant.

COLONIAL FRUIT SUPPLY.—A month after its proper time for closing, the Tasmanian Apple season has ended. Some 50,000 bushels of fruit from Hobart have been elbowed and jostled in the market here by Gooseberries, Strawberries, Cherries, Currants, &c.—very much to the discomfiture of the antipodean fruit. In fact, the season has not been a good one for our colonial friends. We were promised immense imports from New Zealand, Australia, Tasmania, and the Cape; and yet the student of prices recorded week by week in these and other columns will not have noticed that any blank has been drawn for our own or Canadian Apples. Something has evidently gone very seriously wrong. Before the season began we were informed by the agent-general for Tasmania that 240,000 bushels of

* *Le Potager d'un Curieux*, par A. Pailleux et D. Bois Paris, Rue Jacob, 25).

Apples were to be sent over during the season now ended. Twelve steamers were to call at Hobart, one a week, thus covering the season, or what was mapped out as the season. Some 180,000 bushels have come to hand, a large proportion of these in an un-

one—the whole season's venture, we imagine, must have tried the pockets of the Tasmanian Fruit Growers' Association. As at home very often, so in Tasmania occasionally, there appears to have been a bad crop, unfit for harvesting; the fruit has been

condition at the proper time. The cause of the failure on the part of the fan ought to be carefully inquired into; the agents in London ascribe the failure to a most irregular temperature being kept up; the engineer's "lug" ought to show whether such was the case or otherwise. The supply from Melbourne, Sydney, and elsewhere in Australia, need not be noticed, nor have we any data as to their sales, profitable or otherwise. We may just glance at the venture by the company at the Cape of Good Hope. One of the firm of DOTHNOT & SAINSBURY, of Fenchurch Street, went out to the Cape with a stock of cork shavings or dust, with which to pack the goods, and himself assisted and superintended the packing of Grapes and other tender fruits, also Apples and Pears. The Apples may be dismissed; it is proper to observe of the Pears that the promise of flesh held out by all external appearance was not facted, and we do not think, unless a decided improvement is shown next season, or 9d. each at auction (on the average), will not be the price of Cape Pears in 1893. Black Barbarossa Grapes—other varieties as well—brought very high prices, both at auction and in the Avenue, where other and very good Grapes were exposed at 5s. per pound. We have it on the authority of the firm above-mentioned, that they got over 30s. a pound for much of the Grapes they put up. Arrangements are being made for sending out to the Cape a large stock of cork dust or waste for packing. All the facts above stated, suggest their own "moral"—those who are primarily concerned may, we think, safely be left to point the moral, assured that properly and regularly supplied with good fruit, we can consume, at good prices, what our Colonial friends may care to send us.

COLOURING WEED DESTROYERS, ETC.—So many accidents have happened in connection with liquid weed-destroyers, sheep-dips, insecticides, and other poisonous liquids, that it is quite time steps were taken to make these liquids declare their dangerous character by means of some special colour, for too often they are used in unlabelled bottles, which, from their shape, &c., may be presumed to contain alimentary liquid. It has recently been proposed to introduce chromium compound into such preparations when they are of an alkaline character, or when they are not alkaline, but are compatible with an alkali, to introduce a chromium compound mixed with alkaline matter. Although this proposal scarcely promises to meet every case, it certainly looks like a move in the right direction, and is to be commended even if it only partially succeeds in preventing accidents and crimes.

THE FRUIT OF THE LAUREL CHERRY.—In one respect, at least, the fruit of the Laurel Cherry resembles the berries of the Mountain Ash; both contain a saccharine substance which is known to chemists as sorbitol. This has recently been determined by members of the Paris Academy of Science, viz., MM. C. VINCENT and DELACHANAL, who contribute a paper to the *Comptes Rendus*, cxiv., pp. 486, 487. They also found mannitol in the Laurel Cherry fruit, which is the chief component of manna, an exudation collected chiefly in Sicily from two species of Ash, *Fraxinus ornus* and *F. rotundifolia*; this substance is sweet, and has also been found in other plants, in several Sea-weeds, and in Mushrooms.

LATENESS OF THE SEASON IN THE NORTH.—A correspondent writing under the date July 23, remarks about the crops in Forfarshire:—"I have been too late this year; all the fruit has been so far back that I could not see my way to report till this week. Gathered the first Strawberries yesterday; under average in this neighbourhood. Gooseberries and Currants nearly average; Raspberries only in flower; Apples, Pears, and Plums much under average. Cloudy, cold days, less sunshine, and more rain than we have had at this season for five or six years. Potatoes late, and a light crop, as far as they have been lifted. Grass and all kinds of weeds most luxuriant.

FIG. 21.—WHITE MASDEVALLIA HARRYANA, VAR. GRAVENII. (SEE P. 122.)

ripe, immature condition—three of the vessels making the long instead of the direct voyage between ports, and the attempt to bury a large amount of fruit in the ship's hold, kept at a certain temperature by means of a steam-driven fan, having failed. This last experiment must have proved a very costly

packed and sent off, the last three consignments having to be placed on a loaded market, much of it in a very crippled condition. As Jacob Faithful says, however, "better luck next time," if it is remembered to send only goods fitted for the British market, and despatched so as to arrive in good

EXAMINATION PAPERS OF THE SURREY COUNTY COUNCIL.—In our last week's issue we alluded to the efforts now being made by various County Councils to impart a knowledge of horticulture to residents in the rural districts. We now publish the questions put by the examiners appointed by the Royal Horticultural Society after communication with the lecturers, so as to ascertain what subjects were treated of. Each candidate had to answer any eight of the following questions, as showing the nature of the knowledge imparted.

Higher Grade.

1. What constituents do plants obtain from the soil, and how do they obtain them?
2. Explain the benefits to be derived from draining, digging, and trenching the soil.
3. What differences exist in the cultivation of green crops, and of root crops respectively? What kind of manure is suitable in each case?
4. What advantages are derived from dressing the land with lime, and how ought it to be applied? For what purpose is gas lime of value?
5. What is the most appropriate season to apply nitrate of soda to crops? And state the reasons for the choice.
6. For what objects is pruning resorted to? Why is summer pruning in some cases preferable to pruning?
7. Name some fruit-bearing trees and bushes which bear on the old, and some which produce fruit on the new wood, and state what modifications are consequently required in the method of pruning.
8. What methods would you adopt to get rid of (a) annual weeds, (b) perennial weeds?
9. Give a brief sketch of the life-history of the winter moth, and state what measures are most likely to be effectual in keeping it in check?
10. Name some other insect pest affecting fruit trees, and indicate methods of destroying them.
11. In what ways does the Potato and Tomato fungus (*Peronospora*) do harm to the Potato, and to the Tomato respectively?
12. How may the ravages of the Potato fungus (*Peronospora*) be kept in check?

Lower Grade.

1. What are the characteristics of good garden soil, and what steps should be taken to improve a soil that is too light, and one that is too stiff?
2. Point out the advantages of deep cultivation, and describe the proper method of trenching the ground.
3. Describe the best methods of cultivating Potatoes to obtain an early and late supply under varying conditions of soil and position.
4. What is the most suitable time for sowing seeds of green crops (Cabbages and the like)? Give a brief outline of the principal points to be observed in their culture.
5. Describe briefly the methods of propagating Gooseberries, Currants, Raspberries, and Strawberries.
6. What are the conditions requisite for the success of grafting and budding? State the best time of year for performing these operations.
7. Name some of the trees and shrubs that are propagated by budding and by grafting respectively, and state why those operations are performed.
8. What are the objects sought to be obtained by earthing up Potatoes, Celery, Peas, and Cabbages?
9. What special effects are produced on plants by nitrogenous manures, whether of animal or vegetable origin?
10. To what crops, and at what season, may superphosphate of lime be employed with advantage?
11. How are weeds injurious, and why are some more so than others?
12. What methods should be employed to destroy weeds?
13. What are the principal insect enemies of the Apple, and state briefly the best methods of dealing with them?
14. What are the most common enemies of Cabbages, Turnips, and Celery, and how may they best be combated?
15. Which parts of a flower are essential, and which accessory?
16. What steps would you take to prevent fertilisation through the agency of insects, so as to keep a particular stock "true"?

ORCHIDS FROM GRENADA.—In addition to the Vascular Cryptogams collected under the auspices of the West India Exploration Committee by Mr. R. V. SHERRING, F.L.S., and described in the *Annals of Botany*, vol. vi., No. 21, April, 1892, by Mr. J. G. BAKER, F.R.S., his collections have yielded about thirty species of Orchids from Grenada, some of which are of considerable interest. These have now been determined by Mr. R. A. ROLFE, A.L.S. The Orchids of Grenada appear not to have been systematically collected before. There is no record of species from that island in GRISEBACH'S *Flora of the British West India Islands*, 1864, and only about three or four were represented in the Kew Herbarium. Mr. SHERRING'S collections therefore enable us to arrive at a tolerably good idea of the distribution of Orchids in the island. A species of *Bracliio-*

nidium, a genus not hitherto represented in the West Indian flora, is probably new, as also species of *Scaphyglottis* and *Cranichis*. *Hexisia reflexa*, *Pleurothallis pruinosa*, *Oncidium luridum* and *Ornithocephalus gladiatus* have not hitherto been found in the smaller islands, the recorded specimens being chiefly from Jamaica and Trinidad. *Dichaea hystri-cina* has not been found before except in Cuba by WRIGHT and EGGERS. *Xylobium* (*Maxillaria pallidiflora*) was recorded before only from St. Vincent, and *Elleanthus lepidus* is new to the West Indian flora. The remaining species are found in many islands, such as Jamaica and Dominica, but their occurrence still further south is a point of some interest. Of Mr. SHERRING'S general collection a number of *Phanerogams* have still to be worked out, says the *Kew Bulletin*.

AGRICULTURAL RESEARCH ASSOCIATION.—Mr. JAMESON, in his annual report, says that there is "(1), a demand for information that will be of immediate benefit in practice; (2), a demand equally utilitarian, but having reference more to the foundational or permanent interest in agriculture; and (3), a demand for truth, the utility of which may not be apparent at the moment, but which, if bearing on practice, throws a light on the whole subject that the former two branches are unfit to call forth." Of course there is no question at all as to the vastly superior advantages in the long run of researches carried out with the sole object of ascertaining the truth, irrespective of any possible immediate benefit. The "fertile" discoveries have been made by the Faradays and others, who made their investigations from a scientific point of view only. Although the ultimate benefit to the practitioner is incomparably larger, yet he cannot afford to wait. Art is long, life is brief, and so utilitarian methods must be adopted, but scientific research should be carried on simultaneously. In the present report, Mr. JAMESON reprints his observations on root hairs, in which he arrives at the conclusion already formulated by GASPARRINI, that these hairs, sometimes at least, present a minute aperture, by means of which solid particles gain admission to the root.

MR. PETER BLAIR.—We learn that Mr. P. BLAIR, gardener to the Duke of SUTHERLAND, at Trentham, intends vacating that post to become the landlord of the Trentham Hotel, in the neighbouring village of that name.

ERICA WILMOREANA.—Our French friends seem perplexed over this name. In France it is occasionally called *Vilmoriniana*, as if it had reference to M. VILMORIN. At other times it is written *Wilmoriana*, or *Willmoriana*, *Willmoriniana*, *Wilmorei*, *Willmorei*. In fact, the permutations clearly might be made very numerous. English horticulturists will know that the word is derived from WILMORE, and they will regret that a Latin technical name was ever given to a garden product.

LIGHT-SHUNNING IVY.—Mr. W. G. SMITH sends us a memorandum in which he notes the circumstance that three plants of variegated Ivy growing in pots in his work-room invariably turn their growing shoots away from the window. *Pelargoniums* and other plants in the same window direct their shoots to the light. The very absurd name "negative heliotropism" has been applied to this light-shunning propensity, which in the case of the Ivy, may have some connection with the emission of the aerial roots and the necessity for support.

A STINGING LABIATE.—We all know the Stinging-Nettle, and a good many of us know that the Dead-Nettle, so-called, is no Nettle, but a Labiate. Now it appears that there is a stinging "Dead-Nettle." At any rate, the *Kew Bulletin* states that the Rev. A. BARON has discovered in Madagascar a true Labiate with stinging hairs, and the general aspect of the two plants above mentioned. What an opportunity for naturalists like Mr. GRANT ALLEN to exercise their imaginative faculties.

HOLIDAYS ROUND HAMBURG.—Those who cannot take a holiday round Hamburg can do the

next best thing by investing a penny in the purchase of a little handbook published at 30, Fleet Street. It is full of tempting illustrations and graphic descriptions, which will be as helpful to those who can go, as they are pleasant to those who cannot go.

TRANSLUCENT BRICKS.—M. RENÉ ANDRÉ, engineer, has lately described in the *Revue Horticole*, some glass bricks used in the construction of a hot-house at Lyon. They are the invention of a Swiss architect, M. FALCONNIER, of Lyon, and are of blown glass. Each measures 20 centimetres in length, 14 centimetres in depth, and 115 millimetres in thickness. They may be set in mortar or cement. Fifty such bricks are required to cover a metre of surface. The cost is 24 francs a hundred.

NATIONAL PINK SOCIETY (NORTHERN SECTION).—The annual exhibition of northern-grown Pinks took place in connection with the Rose Show at the Botanical Gardens, Old Trafford, on July 23. Late as the fixture was, some of the northern Pinks were not in bloom, and in some places the buds of Carnations and Picotees are scarcely showing colour. The best twelve blooms of Pinks, in not less than six varieties, were shown by Mr. M. Campbell, florist, Blantyre, N.B.; Mr. A. R. Brown, Handsworth, Birmingham, was 2nd. Mr. Campbell also had the best six blooms, dissimilar; Mr. C. F. Thurston, Wolverhampton, being 2nd. In another class for six, in three varieties, Mr. A. R. Brown was 1st; and Mr. S. Barlow 2nd. One class was for three blooms—a purple-laced, red-laced, and black and white; and here Mr. W. Taylor's Middleton was 1st, and Mr. J. Edwards Blackley, 2nd. The premier purple-laced Pink was Boiard, shown by Mr. M. Campbell. The best red-laced Pink was *Minerva*, shown by Mr. A. R. Brown. Mr. Walkden, Sale, staged an interesting collection of miscellaneous Pinks.

LIVERPOOL HORTICULTURAL ASSOCIATION.—An excellent show was held on Wednesday, July 20, in Sefton Park, the number of exhibits exceeding 400. The *Gardeners' Magazine* prize, for the best amateur exhibit, fell to Mr. T. S. TIMMS, of Allerton (gardener, Mr. B. CROMWELL). Fruit was not largely shown, but it was generally of great excellence. The Hon. C. H. WYNNE was the winner in the eight dishes class, and Mr. A. R. GLADSTONE in that for six dishes, as also for Peaches and Nectarines. Sir THOMAS EARLE, Bart., was the winner of the best basket of miscellaneous fruit class, as also for the collection of vegetables.

NATIONAL WILD FLOWER EXHIBITION.—An exhibition on a large scale was held in the Music Hall, Edinburgh, on July 22 and 23. The exhibit consisted of wild flowers gathered and arranged by children, to whom prizes were allotted, whilst the proceeds were devoted to the Royal Sick Children's Hospital, Edinburgh. No fewer than 1642 exhibits were received. In one class (hand bouquets), the number of competitors amounted to 880. What work for the judges, Mr. M. DUNN, Mr. LINDSAY, Mr. T. MILNE, and Mr. J. JOHNSTONE!

TRENTHAM AND HANFORD HORTICULTURAL SOCIETY.—The fifth annual exhibition of this flourishing society was held on July 21, and was in every way a success, the weather being everything that could be desired, the attendance good, and the show particularly good one. The show was opened by His Grace the Duke of SUTHERLAND, accompanied by the Duchess and a large cortège. The liberal prizes offered brought very strong competition in the various classes. The principal plant-classes were the groups arranged for effect, and we question if a finer lot has been put up this season. The cut flowers were also very fine, although in the Rose competition many of our leading growers telegraphed to the effect that owing to the severe storms they could not appear, as their blooms were damaged; still, those shown were a fine show. The Grapes were excellent, nearly 300 bunches being exhibited—good bunches, fine berries, and well finished. A splendid group of Carnations of the Souvenir type were exhibited by Mr. JENNINGS, gar-

dener to Mr. LEOPOLD DE ROTHSCHILD, of Leighton Buzzard. We append some of the best prizes, viz., for groups:—1st, Mr. CYPHER, for a superb arrangement; 2nd, Mr. MCINTYRE, gardener to Mrs. G. PEASE, Darlington; 3rd, Mr. EDMUNDS, the Gardens, Bestwood. For fruit:—Collection of nine dishes, Mr. GOODACRE, gardener to the Earl of HARRINGTON.

WINDOW GARDENING IN THE EAST AND IN THE WEST.—One of the judges at the Window Gardening and Industrial Society of Kensington and of Stepney, writes that he was astonished to find in the heart of Stepney some of the neatest gardens he had ever seen. The gardens are only a small part of the philanthropic schemes put in practice by the Rev. S. B. BRIDGES. On leaving Stepney, the judges proceeded to Kensington, where, though the latter suburb has the advantages of purer atmosphere, the gardens, window-boxes, &c., were found decidedly inferior to those at Stepney. On the next day a cottagers' show was held in the grounds of Argyll Lodge, when the exhibits were of good quality.

COTTAGERS' AND ARTIZAN'S SHOW AT THE INTERNATIONAL HORTICULTURAL EXHIBITION.—This exhibition, which takes place at Earl's Court, on Bank Holiday and the two following days, promises to be a large and important one, and judging from the quality of the vegetables shown by cottagers during the past fortnight, there is reason to believe that garden produce will be seen in the best character. The home counties promise to furnish the largest portion of the exhibits submitted for competition.

CARDIFF HORTICULTURAL SHOW.—The entries for the forthcoming show to be held on August 17 and following day, promise well for the success this year of this important provincial exhibition. And provided the fates are propitious, so that fine bright weather prevail, the gathering of South Wales folk will be a very large one. August 11 is the last day on which entries can be made.

HAMMERSMITH HORTICULTURAL SOCIETY.—The annual summer flower show took place on Thursday, the 21st inst. Noteworthy was a group of foliage and flowering plants, not for competition, staged by Messrs. C. LEE & Co., Royal Vineyard Nursery. Some capital examples of British Ferns gained the premier place, for Mr. HILLIER, Black Lion Lane, an amateur who beat the professional gardeners in this class, in which section (gardeners) the most successful competitor was Mr. GOSLING, gr. to T. ELSLEY, Esq., Longthorpe Lodge, Goldhawk Road.

THE NATIONAL CO-OPERATIVE FESTIVAL.—This now well-known event will be held at the Crystal Palace on Saturday, August 20. The promoters—who are representatives of working men's co-operative societies throughout the kingdom—intend to a great extent to follow their programme of previous years, and provide a flower show, under the auspices of the Agricultural and Horticultural Association; also an exhibition of co-operative productions from profit-sharing workshops. There will be a number of attractions, and athletic and other contests. The general secretary is Mr. WM. BROOMHALL, 49, Bedford Street, Strand, W.C.

ACTON HORTICULTURAL SOCIETY.—The twenty-fifth annual summer show of this Society took place in Acton Park on the 27th inst., and was in all respects a success. Group of stove or greenhouse plants, amateurs, 1st, Mr. T. BUTCHER, gr. to Mrs. Toynbee. Here was a fine plant of *Brugmansia Knightii*, some 9 feet in height, with several of its handsome pendent flowers; 2nd, Mr. G. BURHAM, gr. to R. O. DAVIES, Esq. In the class for a specimen stove or greenhouse plant in flower, Mr. BUTCHER led with a well-flowered plant of *Stephanotis floribunda*. Ferns were well shown by Mr. Brooks, gr. to H. G. LAKE, Esq., Fairlawn House, who also showed remarkably well in other classes. For table decorations,

Mrs. C. B. Green, Myrtle Road, was 1st with a nice arrangement. Miss Hudson, Gunnersbury House, also showed well, but not for competition. The most successful competitors in the Grape classes were Messrs. T. Batcher and W. Brooks. Messrs. C. Lee & Son, Ealing, sent a charming group of herbaceous plants in flower, as also a beautiful collection of cut Roses. The cottagers made a remarkable display of vegetables.

WEYMOUTH PINE FUNGUS.

WE have now the opportunity of figuring the very curious fungus which appears on the shoots of the Weymouth Pine, and which is identified by Dr. Klebahn, of Bremen, as *Peridermium Strobi* (see fig. 22). This fungus, unlike *P. pini*, attacks the shoots only; but what is still more curious is, that when the fungus in question grows on a Currant leaf, its appearance is so completely different that it has received the name of *Cronartium ribicola* as if it belonged to a separate genus. Of course, such a statement would necessarily be received with incredulity by those unfamiliar with the ways of fungi. Experimental proof, however, is not wanting, and "heterocism" (would that someone could hit on an expressive English term!) is now a well-established fact. Up till recently the *Cronartium* had not been found on Currant leaves in this country; but at the very time when we were in correspondence with Dr. Klebahn about his *Peridermium*, Dr. Plowright, of King's Lynn, detected the *Cronartium* on Currant leaves, and sent us specimens, as drawn by Mr. Worthington Smith at fig. 23. We append Dr. Klebahn's letter, from which the practical inference may be drawn, not to grow Weymouth Pines and Currant bushes in proximity:—

"The specimen of fungus of *Pinus Strobus* is indeed *Peridermium Strobi*, Kleb., the spores having the characteristic smooth spot on the cell-walls (see *Abhandl. naturwiss. Verein. Bremen*, x., p. 153; *Taf.*, i., figs. 5—8, 13, 14). This fungus only lives on the bark of *Pinus Strobus*, L., *P. Lambertiana*, Dougl., and *Pinus Cembra*, L., not on the needles. It is an heterocel one, the other generation of it, *Cronartium ribicola*, Dietr., occurring on species of *Ribes*; the teliospores form yellow pulverulent clusters, the teleutospores are compacted to horn-shaped cylindrical bodies, both often spread over the whole underside of the leaves. Neither *Peridermium Strobi* nor *Cronartium ribicola* have been met with in England before, as far as I know (see Plowright, *Brit. Weed. and Ustilag.*, pp. 249 and 254). As the former is a very dangerous enemy to the Weymouth Pines, English gardeners will do good to combat it in time, by cutting off and burning the branches and stems affected by the fungus and by extirpating any Currants (*Ribes nigrum*, *aureum*, *alpinum*, *sanguineum*, *rubrum*, &c.), in the neighbourhood of Weymouth Pines.

"There is no relation between this *Peridermium* and those of the common Pine, *Pinus sylvestris*. From the latter, one, occurring on the bark only (*Peridermium Cornui*), produces the *Cronartium asclepiadeum* or *Vincetoxicum* (after cultures of Mr. Cornu and of my own); another on the needles only (*Peridermium oblongosporium*) produces the *Coleosporium senecionis* on the Groundsel (*Senecio*). There are some other *Peridermia* on the bark and on the needles of *Pinus sylvestris*, the life-history of which is not yet known; some remarks upon them will be published shortly. H. Klebahn."

REMARKS ON THE FRUIT CROPS OF 1892.

[For Tabulated Summary, see p. 93.]

0, SCOTLAND, N.

MORAYSHIRE.—After the wet sunless autumn of last season, and the severe frosts we had in March and April, it was wonderful to observe how large was the crop of Apricots, Peaches, and Plums which set. Standard Plums have all set more freely than on wall-trees, but especially Victorias, Czar,

and Mitchelson. Both Apples and Pears are almost a failure, whereas small fruits, with the exception of Gooseberries, are a heavy crop, but fully ten days later than last year. C. Webster, Gordon Castle, Fochabers.

NAIRN.—All small fruits are plentiful: Raspberries looked at one time as if they would fail, being greatly crippled by spring frosts, but they have greatly improved. On aged standards, Apples are loaded with fruits, but fruit on young trees is very thin. Peaches and Apricots are almost a failure. Cherries dropped much of their fruit; Late Duke and Morellos are good crops. Strawberries are a wonderful crop—the sorts Noble, a fine-looking fruit, but deficient in flavour, Garibaldi, Duke of Edinburgh, and Elton Pine are very fine. James Maitland, Cawder Castle.

SUTHERLANDSHIRE.—In the North, the present year up to this date (July 9) has been cold and wet, with unseasonably late spring frosts, and very little warm weather in May and June. Occasional sun, showers, and frosty nights during the blooming period made the fruit prospects for the year at one time very doubtful. During March, twenty nights were frosty, the lowest being 10° of frost on the 27th. In April, from the 12th to the 19th, we had frosts of from 4° to 7° every night. Still, the fruit crop has turned out better than was expected. Gooseberries and Currants are a heavy crop. Apples plentiful. Raspberries and Strawberries good. Plums over average, and clean. Cherries an average crop. Caterpillar has been troublesome, but it is easily kept under by timely application of Hellebore. D. Melville, Dunrobin Castle Gardens.

1, SCOTLAND, E.

ADERDEENSHIRE.—Fruit crops in this locality this season are rather variable. Apples had a very abundant blossom, and set well on some trees, on others very thinly. Pears had very little blossom, and are a poor crop. Plums, which usually do well, are rather a poor crop; they had little blossom, but set fairly well, and have suffered less from insects than usual. Cherries had an abundant blossom, but have only set a fair crop. Small fruits of all sorts are a most abundant crop. J. Forrest, Haddo House.

Our wall fruit trees suffered from severe frosts. We registered 44° of frost on February 20, and also 33° on March 15, which nipped all the fruit-buds. Simon Campbell, Fyvie Gardens.

EAST Lothian.—The very cold weather of spring has proved most prejudicial, old trees being, as a rule, furnished with only a scanty crop; young trees much better. Strawberries in some places damaged by late frosts. Small fruits of all kinds are most abundant, and the quality is excellent. R. P. Brotherton, Tynninghame.

FIFESHIRE.—This has been the coldest and wettest season we have had for eleven years; night temperature seldom above 50°, and little sunshine during the day, consequently outside crops looking anything but promising. Apples and Pears are very small. Wm. Henderson, Balbirnie Gardens, Markinch.

I have no hesitation in saying this is the worst season for fruit of all sorts I have seen in this part of the country for the last thirty-six years. R. Gossip, Crawford Priory, Cupar, Fife.

FORFARSHIRE.—Owing chiefly to the protracted cold dry spring, the hardy fruit crops in this district generally are a failure. Of the large fruits I have not seen a tree bearing even an average crop, either on walls or in open quarters. There is a sprinkling of Victoria and Orleans Plums here and there, but everyone I meet say they have no crop. Bush fruits generally are an average crop, black Currants being scarcest. The Strawberry crops suffered from the frosts of June 12 to 14. Our plants were so much injured that at date we have not yet picked a Strawberry. J. Whitton, The Gardens, Glamis Castle, Glamis.

KINCARDINESHIRE.—Gooseberries and Currants of all kinds an extra heavy crop; too early to say what the crop of Strawberries may be. I fear they will

not be so good as the immense blossom indicated. Pears in this locality no use except on walls. *J. M. Gairns, Arbuthnott, Fouldoun.*

MIDLOTHIAN.—The cold, late, and changeable spring was very trying to fruit crops during the flowering period. Frost in the beginning of April killed most of the Pear and Plum blossom on wall trees, except what was within two inches or so of the face of the wall. The same nip of frost—9 degrees—killed the young Peaches and Apricots, except those close to the wall, although they were protected by two-ply of old herring nets; still, the crop of Apricots is a heavy one, and being close to the face of the wall, the fruit is very fine. Later Pears, Plums, and Cherries set fine crops; but while the Apples were in full flower, in the middle of May, a few cold, raw, wet days prevented them setting, and the crop is light, but the fruit is large and clean. Except Gooseberries, which were nipped by the April frost, all other small fruits are bearing a heavy and fine crop. Strawberries are the finest we have had for some years. Fruit trees are healthy and clean, and have not suffered to any extent this season from insects. *Malcolm Dunn, Dalkeith Gardens.*

PERTSHIRE.—The crop is very bad—in fact, we could not say how bad it is till now, as what fruit was set did not come to anything. *P. W. Fairgrieve, Dunkeld House Gardens, Dunkeld.*

— Apples and Pears, the latter especially, had a grand appearance when in flower; but the severe frosts in April have left us with scarcely a fruit, Jargonelle and Marie Louise Pears being the only varieties having anything like a crop. Gooseberries were just coming into leaf on April 15, when we had 17° of frost, which killed nearly the whole of the bloom, and in some instances a large number of the branches withered off. *J. Croucher, Ochertyre, Crieff.*

SEIKIRKSHIRE.—Owing to the gales we had at the end of May and beginning of June, the Apple blossom was very much damaged. Some trees have fair crops, and others blank. Victoria Plums are an abundant crop; Jefferson, Kirke's, Washington, and Green Gage, are fairly good. Small fruits, especially Red Currants, are a heavy crop, but all things are rather late, owing to the low temperature we are having at the present time. *W. G. Pirie, Sunderland Hall Gardens.*

6, SCOTLAND, W.

AYRSHIRE.—Not for years have we had such a poor crop of hardy fruit. Apple and Pear trees had a very promising appearance when in blossom, but the crop has turned out very badly, and until recently the foliage had a very unhealthy look. The Gooseberry bushes are much damaged with red-spider, and the crop of this fruit is in some gardens a very poor one. Black Currants have a heavy crop. *D. Murray, Culzean Castle, Maybole.*

— All outdoor fruits are under average, the late frosts destroyed much of the bloom. With fine weather (which is much needed) the quality of most things should be good. We have been having too much rain and dull weather of late. *W. Priest, Eglinton Gardens, Irvine, North Ayrshire.*

DUMFRIESSHIRE.—We never count on good crops of Apples and Pears outdoors in this locality, but this season they are more deficient than for the last twenty-five years. Indeed, this has been the most unfavourable season of my experience. There have been (July 4) only two days that were anything like summer, and the temperature all through May and June has been very low, often below freezing, and seldom above 40° at night. Strawberries will not be ready for ten days or a fortnight yet. *D. Thomson, Drumlanrig.*

LANARKSHIRE.—A splendid promise of Apples and Pears in the Clydesdale orchards was ruined by the severe frosts we experienced in April and May. Apple and Pear trees, which were literally bristling with fruit-buds, have failed to produce a single fruit. Plums, on the other hand, are abundant, more especially the Victoria, which succeeds remarkably well

on the stiff clayey loam peculiar to this neighbourhood. Damsons are fairly heavy. New Orleans and Magnum Bonum full crop. Cherries are abundant and large. Peaches nil. Apricots very thin. Gooseberries under average. This crop is an important one in the orchards on Clydeside, the varieties Whitesmith and Whinham's Industry being grown in quantity. Red and black Currants are excellent both in abundance and quality. Strawberries abundant and large. *A. Angus, Dalziel Gardens, Motherwell.*

STIRLINGSHIRE.—All kinds of fruits, except Apricots, promised an abundant yield, but soon dropping commenced after the blooms had set, and the thinning was a very severe one. Black Currants on bushes planted last year are weighted to the ground with fruit. Other small fruits were severely punished by late frosts. Apples and Plums dropped three-fourths of their fruit when they were as large as Filberts. *M. Temple, Carron House, Falkirk.*

2, ENGLAND, N.E.

DURHAM.—Apples and Pears never were certainly worse in this county than this year, the trees being simply fruitless, and everywhere in the county you have the same tale from those who cultivate fruits.

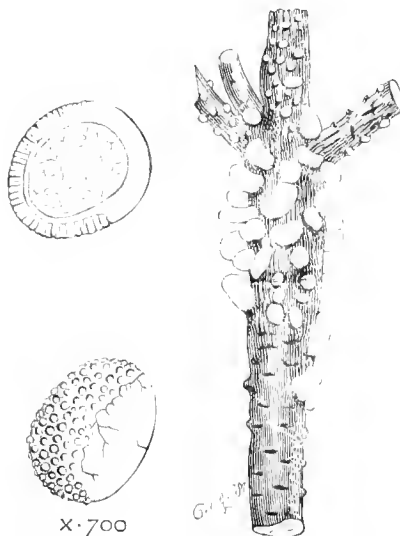

FIG. 22.—*PERIDERMIMUM STROBILI*: SPORES DRAWN BY DR. KLEBAHN.
A Fungus occurring on the shoots of the Weymouth Pine, and in a different form on the leaves of Currants.
(SEE P. 132.)

Amongst Apples, such free croppers as Lord Suffield and the various Codlins are without a fruit. Strawberries, Currants, and Gooseberries are fairly represented. Pears are fine under glass, and if a gentleman wishes good fruits, this is the way to get them in Durham. *J. Hunter, Lambton Castle Gardens.*

— These gardens are near the sea, and very few varieties of Apples and Pears will ripen. We had a cold May and June, which caused a late blooming of fruit trees, and this was favourable to the setting of the fruit; Lord Suffield, various Codlins, and the new Hawthornden, are the best. Pears do not ripen well; the varieties Jargonelle, Marie Louise, Louise Bonne of Jersey, and Bergamot produce fairly good fruits if the summer is warm and dry. *R. Draper, Seaham Hall Gardens.*

— Apples and Pears have but poor crops, but the fruits are likely to be of fairly good quality. Peaches and Nectarines are not grown with us outside; Apricots are almost a failure as regards the fruit, for the frost not only destroyed the buds, but the wood as well. *John Short, Hummersknott, Darlington.*

NORTHUMBERLAND.—In the gardens many kinds of Apples are a full crop, but in orchards only a light

crop. The following are a few of the best:—Red Calville, Keawick Codlin, Pott's Seedling, Ecklinville Seedling, New Hawthornden, Grenadier, Lane's Prince Albert, Frogmore Prolific, Stirling Castle, and a few others. Strawberries are a fair crop—Noble is a very fine variety for early use. Pears are a light crop. Plums on walls are very fine, viz., Denyer's Victoria, Lawson's Gage, Jefferson, and Kirke's. Peaches and Apricots are a full crop, and the trees healthy. Gooseberries are very heavily cropped, especially Sulphur Yellow. *G. Harris, Alwick Castle Gardens.*

— The late spring frosts made sad havoc this season with the Pears and Plums, but small fruits are fairly good on the whole, and Gooseberries first-class, particularly Whinham's Industry, which is as usual a very heavy crop, and is undoubtedly a sure bearer, and the most productive for early market or jam purposes. *William Fell & Co., Royal Seed and Nursery Establishment, Hexham.*

YORESHIRE.—There was good promise of an abundant crop of most kinds of hardy fruits in the shape of there being plenty of blossom, but which, in the case of Apples and Pears, failed to set. In my opinion, this was caused more by the embryo fruit-buds not being well developed last autumn than from spring frosts. We never get good crops of these fruits hereabouts when the previous autumn is cold and wet, as it was in 1891. The months of April and May were fine and dry, though there were frequent frosts at night; yet we have an abundant crop of Gooseberries and Currants of all kinds. Peaches on walls are the best crop for some years past. We took care to keep the trees healthy last year, and the wood well laid in, so as to get it as ripe as possible; the only protection they had was a one-inch mesh herring-net hung double the whole depth of the wall, and kept therefrom by some Larch poles about 8 feet apart. Late in the autumn we partially lifted the roots, which doubtless had something to do with the young wood getting more consolidated. All fruits are fully a week to ten days later this year than in the average of years, though the season's growths are, generally speaking, very healthy. Keswick Codlin is the best Apple; as to crop, the trees are loaded all about us. *H. Clayton, Grimston Park Gardens, Tadcaster.*

— The fruit crops in this district as a whole are the best of the past ten years, and trees more vigorous. Pears are much under average. The following varieties are carrying a fair crop, Williams' Bon Chrétien, Beurré Diel, Marie Louise, Thompson's, Louise Bonne of Jersey, Délices d'Hardenpont, Flemish Beauty, Dr. Trousseau, Crassane, Styrian, Seckle, and Beurré Goubault. Apples are heavily cropped, Lord Suffield, Keswick Codlin, Mère de Ménage, Nonsuch, Blenheim Orange Pippin, Mannington Pearmain, King of the Pippins, Ecklinville Pippin, Schoolmaster, Stirling Castle, Queen Caroline, Northern Greening, and Stackpool. Plums are never a heavy crop on our strong limestone soil with the exception of Victoria and Gisborne's, which crop well generally. *Wm. Chuck, The Gardens, Brods-worth Hall, Doncaster.*

— Apples, Pears, and Plums all promised well when in flower throughout Holderness, but the trees are not carrying more than 20 per cent. of an average crop. *Thos. Lambert, Burton C. stable.*

— The 17° of frost registered here on the morning of April 16 ruined the crop of Apricots, and considerably thinned the Gooseberries. Apples did not set well, and are a thin crop; the varieties which promise the best yield are Lord Suffield and King of the Pippins. *J. Riddell, Castle Howard Gardens.*

— Considering the cold, backward season, the fruit crops in this locality are very fair. Apricots on outside walls thin, very good crop in the open shed. Keswick Apples rather scarce; Pears very strong and good on walls; early Plums thin crop, some late kinds plentiful; dessert Cherries very heavy crops on untrained trees. Laxton's Noble Strawberry is a heavy crop. *Bailey Wadds, Birdsall House Gardens.*

YORKSHIRE.—The show of bloom on all fruit trees was very good, especially on Apples and Pears, but on April 14, 15, and 16, we had 8°, 10°, and 12° of frost respectively, which destroyed the bunches of bloom, in a great measure, wholly. Peaches are a good crop in this garden, on a high, partially-heated wall. The buds of the Gooseberry bushes were very much destroyed in the winter. *W. Culverwell, Thorpe Perrow, Bedale.*

— Bloom of all description was abundant and fine. We had no frost to injure the blooms, but experienced a great amount of dull cold sunless weather. The crops of fruit are not generally equal to expectation. *Robt. C. Kingston, Brantingham Thorpe, Brough.*

7. ENGLAND, N.W.

LANCASHIRE.—I regret to have to report almost the total failure of two important fruit crops, the Gooseberry and the Apple. The first was destroyed

show of bloom, both on Pears and Apples, Currants and Gooseberries, Raspberries and Strawberries, being much later into flower, escaped the destruction. Driving through Cheshire a few days since, I noticed Damsons to be very few and far between. *B. Barham, Croxeth, Liverpool.*

3. ENGLAND, E.

CAMBRIDGESHIRE.—Apples, Pears, and Plums looked very promising for good crops early in the year, being full of bloom on walls and on standards in the open, but all suffered alike with the late frosts and biting easterly winds, and the same may be said of Peaches, Nectarines, and Apricots. Bush fruits are clean and plentiful in all possessions. It has been a good season for Strawberries for crop, size, and flavour. *Sydney J. Burgess, Dalham Hall Gardens, Newmarket.*

— The Apple and Pear crops in this district are a failure, but this is not a district for growing these

almost a total failure, owing to the frosts that occurred while the trees were in bloom. The Plums, and some of the Cherries, have been badly attacked by the black aphid. All small fruits are good except Gooseberries, which are poor. Morello Cherries were an abundant crop, but the fruit is all dropping off. *J. Douglas, Great Gearies, Ilford.*

— Taken all round, hardy fruits are a failure, Apricots, Peaches, Nectarines, and Cherries excepted. Standard Cherries a heavy crop generally; Morellos, however, sadly thinned by the fruit dropping in stoning. Of Apples, Striped Beautin, Hawthornden, and French Crab carry the best crops here. White Magnum Bonum, Orleans, and Bonne Bouche Gage are the most prolific amongst Plums. Raspberries are bearing well, though many fruiting canes were killed by the frosts in the winter. *William Earley, Ilford.*

LINCOLNSHIRE.—Apple trees look well, and a good crop. Among the best cooking Apples here are Schoolmaster, which takes a leading place. This I attribute to its strong and robust bloom, and it bears abundantly yearly. Grenadier is also a fine bearer, large and early. The same may be said of Queen Caroline, the old and good Keswick Codlin, and Beauty of Kent. Laxton's new Strawberries, Scarlet Queen and Comp-titor, will make their way; I picked a fruit of the latter weighing 3 oz. the other day. *R. Gubert, Burghley Gardens, Stamford.*

— The fruit crops altogether are the worst I have seen for many years. Apples, Pears, and Plums are not one quarter crop, although we had an abundance of bloom; but the severe frosts coming on when the blossom was just expanding, the greater part was destroyed. Of Gooseberries we had an excellent set of fruit, but we had 20 degrees of frost when they were just forming, which brought the greater part to the ground. Apricots and Peaches are good where protected with Frigi Domo. *D. Lumsden, Bloxham Hall.*

— Several circumstances combined to cause the unfruitfulness of the occupants of both orchards and fruit gardens; the wet and sunless autumn of the preceding year left the young bearing wood in an unripened condition, and the long and severe weather of the winter of 1891-92 hardly terminated in May, arrested the growth, and damaged the little blossom that was produced. There could be no fruit when there was no bloom, and half the Apple trees in our orchards had no bloom at all. There was but little prospect of fruit at any time on Pears and Plums, partly from the same cause, and, in the case of Plums, from being overtaxed by excessively heavy crops the preceding year. The Gooseberry crop was injured by late frost. *William Ingram, Belvoir Castle Gardens, Grantham.*

LEICESTERSHIRE.—Pears are not a good crop generally, although the following varieties, Bauré d'Amanlis, B. Superfin, Louise Bonne de Jersey, and Marie Louise are showing well. Of Apples, those varieties which are carrying a sprinkling are Wellington, Peasgood's Nonsuch, New Cauldwell, Celine, Duchess of Oldenburgh, Braddick's Nonpareil, and Post's Seedling. *A. Hausher, Dean Manor Park, Loughborough.*

NORFOLK.—Fruits of nearly all kinds are short in crop, owing to the bad weather experienced in spring and early summer. We had a splendid show of bloom, but there is now but poor show of fruit, Pears, Plums, Apricots, and Peaches are the worst. Cherries are a good crop on standard trees, but not so good on walls, having dropped off a good deal at stoning. Strawberries have been plentiful and fine. There is a good crop of small fruits, but the caterpillar has been very busy amongst the Gooseberries. Nuts, especially Walnuts, are a good crop. *H. Batchelor, Catton Park, Norwich.*

— With one or two exceptions, fruit trees of all kinds are remarkably healthy, clean, and free from insect pests in this district at the present time. Some kinds of Apple trees are heavily laden with fruit, while other sorts have produced little or none. *A. Lancaster, Holkham Gardens, Wells.*

FIG. 23.—CRONARTIUM RIBICOLA.

A, back of black Currant leaf, with spores of two kinds; B, the Uredospores; C, masses of Teliospores; D, the same, more highly magnified; E, Teliospores, from specimens sent by Dr. Plowright. (SEE P. 133.)

by 14° of frost on the 14th and 15th of April, the trees being wet from snow and sleet on the latter date. These frosts must also have affected the unexpanded Apple and Pear blossoms, though few suspected it at the time. The caterpillar finished the work of destruction here and in neighbouring gardens, so that Apple trees known to have borne good crops for twenty years, have one Apple when there ought to be fifty; and Gooseberries the same. *Wm. P. Roberts, Cwerden Hall, Preston.*

— The fruit crops in this district are much below the average, taken as a whole. Apples and Pears, with very few exceptions, being a total failure, which I attribute to the unripened state of the wood, and the severe spring frosts, which also partially destroyed the Gooseberry crop; Plums, too, are scarce; but Peaches on the open wall are a good crop. Cherries, too, especially Morellos, are a very good crop; and Strawberries and Raspberries extra good crops. *J. Hathaway, Lathom House, Ormskirk.*

— Apples are a very poor crop indeed round this district. Pears are better, but much under the average, the 12° and 13° of frost on Easter Sunday and Monday was most destructive to a very excellent

fruits in a large way. Plums are largely planted here but the crop this year is very light. Gooseberries in most gardens suff'ered very much with red-spider, and acres of the bushes looked as though they were dead, but they are now growing well. Many growers have not half a crop; others have a good crop. *Andrew Grant, The Vineries, Willingham.*

ESSEX.—Apples, Pears, and Plums showed well for fruit, but before the blooming period was over the trees suff'ered very much from frosts which were experienced; nearly every morning our thermometer registered a certain number of degrees of frost, and on only seven mornings in the month of April was the thermometer above 32°, and only five mornings were we without frost up to May 15; hence reducing the above-named fruits to about a quarter of a crop. The Gooseberries and Currants suff'ered greatly; Peaches, Nectarines, and Cherries escaped, being well protected; Apricots were killed in bud by 22° of frost on the morning of February 17. *James Vert, Audley End Gardens.*

— Apples are of excellent quality, and a few varieties are heavily laden, others a poor crop; but the trees are very vigorous. Pears and Plums are

SUFFOLK.—Apples on espaliers are carrying good crops in the kitchen garden here, and the fruit will be fine here. In the orchard there are very few. Peaches and Nectarines on walls are a splendid crop. Of Apricots, good varieties of Pears and Plums, we have a large quantity, but they are hardly up to the average. The fruit crop for 1892 is, with us, very satisfactory. *G. W. Eden, Henham Gardens, Wangford.*

— Considering the prevalent low temperature of the early spring months, it is somewhat beyond expectation to find that most of the fruit crops in this district are so good and plentiful. With the exception of Apricots and Pears, which suffered most, other fruits are about an average crop. Plums, and the fruit trees and bushes, are unusually clean and healthy. *J. Wallis, Orwell Park Gardens, near Ipswich.*

— The fruit crops in this district, with the exception of Apples, are very satisfactory. Of Peaches and Nectarines there is a good set, and thinning the fruit has had to be done with a heavy hand. Our trees have been free from aphid, and the leaves are unaffected with blister. Of Cherries both trained trees and standards are excellent. I never saw the latter carrying better crops. The late frosts caused many of the Gooseberry and Currant trees to drop their fruit; still, the crop is a good one. *H. Fisher, Flinton Hall Gardens, Bungay.*

— The fruit crops in this locality are generally very light. Apples, with the exception of King of the Pippins, Court Pendu Plat, a few Ribston Pippins, and Keswick Codlin, are almost a failure here. There are a few trees in the neighbourhood with a fair crop on them. Pears are very scarce, especially the trees which had a full crop last year. Plums, Cherries, and Apricots are almost a blank. Small fruits are plentiful, Strawberries especially, are the finest I have seen here. *Thos. Blair, Shrubland Park Gardens, Claydon.*

(To be continued.)

HOME CORRESPONDENCE.

BUSH *versus* TRAINED PEACHES AND NECTARINES.—The ordinary or general mode of managing Peaches and Nectarines under glass is to train the trees on trellises; but where one has a suitable house, there can, I think, be no question that it is far better to grow them in the bush or loose natural form, for though the fruit may not be quite so fully exposed to the sun and light as when on the upper side of a trellis, much more may be grown, on account of the extra leafage and the free liberty the trees have, compared with those restricted to a flat uniform surface. Being of this opinion, and having a span-roofed structure erected three years ago, I planted four trees on each side the central pathway, and they have completely filled the division, which is 30 feet long by 20 feet wide; although very small pot plants when put in, except one about the same size taken from a wall, the growth they all make being as free as a Willow. The Nectarines are on one side, and the Peaches on the other, the first-mentioned being literally laden with fruit, which I have endeavoured to count on one, and they ran up to over 400, the variety being Pitmaston Orange, which are not yet ripe, but I send for the Editor to see fair samples of Lord Napier, and perhaps he will give his opinion of them. I fear, however, in thus alluding to these particular trees myself that I shall be thought egotistical, but I only wish to show that the system of culture is a good one, and far superior to that which has been so long in vogue, but, as already stated, the house used must be light and of proper height for the purpose. The way we manage our trees is to disbud freely, and leave no more shoots than are absolutely needed for the following year; and if they do appear too thick, or throw too much shade during the summer, we cut out, thin, and shorten back any of the top ones that are overstrong, and depend on the laterals for fruiting. Although we have such heavy crops on the trees, we took more off at the thinning-time than there are left; and where the stoning process is over, our practice is to mulch with old Mushroom-bed dung, in which soot is mixed freely, and a little guano. Heavy soakings of water are then given at times, as required, according to

the state of the weather, till the fruit shows signs of approaching ripeness, but no more after that, as a wet condition of the soil affects flavour. When the Peaches and Nectarines are gathered, it is our practice to syringe freely and heavily, and to close the house at about 4 o'clock in the afternoon so as to help force up and develop the buds, and when these are sufficiently prominent, plenty of air is kept on night and day to aid the wood in ripening, as I attach much importance to that, and in maintaining the foliage fresh, healthy, and green up to the last. *J. Sheppard, Woolverstone Park.*

COUNTY COUNCIL HORTICULTURE—In referring to this interesting subject in your last issue, you ask "what is the result of all this?" that is, the County Council lectures on horticulture in so many parts of the country during the past winter. Well, I would reply, that some foundation has been laid towards the development of wider knowledge than before existed in relation to gardening, but only some foundation, and no more. But then it would be unfair to expect very much more yet. After all, in many districts only four, six, or eight lectures were delivered, and it is not possible to expect that from so small a commencement great results can be hoped for yet. Some good has been done in arousing wider interest in gardening, and there is good reason to believe that very much more interest will be shown in the subject as knowledge is extended. Lecturers' audiences have chiefly been of the working class. In an experience of over fifty lectures, I have found a few gardeners, some of whom have honestly expressed satisfaction, because they had learnt more concerning their art than they before knew, and I have hardly once had to encounter adverse criticism. Still, the bulk of our audiences have consisted of persons other than gardeners, and it, as may be found in all classes of society, there is much of ignorance of common things, still very hearty attention and interest have rarely been wanting. Very much may depend upon the capacity of the lecturer to present his subject in a bright attractive fashion, and also to give really practical information. In some districts attendance and interest would be remarkable, and in others lax and cold, but then it was usually due to the existence of good gardens and allotments, or otherwise. It will be well if County Councils will realise that, in setting in action this horticultural movement, they are doing much to increase the demand for allotments, and thus it becomes all the more incumbent upon these bodies to do their utmost to satisfy that demand. Referring to the recent examination of results instituted by the Surrey County Council, in combination with the Royal Horticultural Society, I would point out that examinations of this kind can only be satisfactory when the members of the audiences take notes freely of what is told them by the lecturers, as only in that way can the mind be refreshed with knowledge, and teachings be theoretically impressed. Now, the average auditor is not only very inexperienced in note-taking, but too often is indifferently educated; hence it was, that out of over 600 persons who heard last winter's lectures in the county of Surrey, only about one-twelfth submitted themselves for examination, the chief places being taken by elementary teachers, who attended the ordinary or school-teachers' courses, and, of course, brought considerable capacity in note-taking to bear on the subject. Without wishing to say a word in deprecation of that particular subject, I fear that rather too much stress is, or has been, laid upon "fruit culture" from a market or profitable aspect. It is not wise to ride that horse too hard. It is not the sole aim and object of gardening. I very much like to press upon auditors a love for flowers of all such kinds as may be grown with comparative ease, and help to beautify our cottage homes, and gratify the most refined senses. Even in dealing with fruit culture, I prefer to advocate it from the domestic rather than from the market or money-making aspect. The happiness of families, their health, comfort, and good-feeding, have their profitable as well as pleasurable aspects, and merit the highest consideration. So far as relates to vegetable culture, very many of the poorest auditors are far from being novices; some of them could now give gardeners many points in vegetable competition; and it is very needful to be careful what is said in the presence of men who can grow ordinary vegetables as well as most. Still, there is a great body who know little, and unfortunately have less taste for gardening. Their sluggish minds the technical education movement may do much to stimulate. I have had already this summer some very pleasurable as well as interesting work in going over large areas

of allotments, noting their merits and demerits, then meeting the allotment-holders, and addressing them in the evening. Such opportunities is like to striking whilst the iron is hot. Better results may be looked for in such case than in addressing gatherings of workers at flower shows, as just then hearers seem more disposed to enjoyment than instruction. However, in those cases very much depends upon the kind of interest locally created—and that differs surprisingly in localities. I think every winter-course should consist of not less than eight lectures, in the proportion of four to ground cultivation, manuring, and vegetable culture; two to fruit culture, and two to flowers. Higher grade instruction may well come later, or to specially-selected audiences. *Alex. Dean.*

RASPBERRIES AT PENSHURST CASTLE—As I had the pleasure to accompany the members of the National Chrysanthemum Society on the occasion of their visit to Penshurst Castle on July 22, I, like most other visitors, availed myself of the opportunity of walking round the fine old kitchen garden, which is of considerable extent. In old-established gardens, one is sure to meet with something, either in the fruit or vegetable line, which is flourishing out of the common run of things, and seems, as it were, to form a particular feature in the garden for common remark. At Penshurst, the palm must be awarded to the Raspberries. I never saw canes loaded with such fine fruit—as large as medium-sized Strawberries. The idea of training is simple and good. Planted in rows, wide apart, the fruiting canes are simply drawn away right and left to stakes, leaving an open space right down the centre over the stools, so that the young canes can grow up and mature in full sunlight quite uninterrupted. Although the kitchen garden appeared to be in a low situation, I noticed that Mr. Bridger had them mulched with short grass, to keep the moisture in the ground. Such fruit as I saw there, punneted and sent to Covent Garden in good condition, would pay well to grow. It would be interesting if Mr. Bridger would state what name he has this variety under, and how long he has propagated his plants from the same stock. *G. W. Richards.*

PARSLEY.—It is good practice to make a sowing of Parsley sometime during the present month, and when the plants are of good size, to transplant a number of them at the foot of a south wall, say from 6 inches to one foot or more away from it. Another good place for a bed of Parsley, is the border in the front of a forcing-house, the bottom-heat from the beds and the sun keeping the plants slightly on the move; and a good supply of leaves may be gathered earlier than from plants in the open quarter. Parsley placed in the situations specified, are easily protected from frost, and the soil being dryish, the plants are not so liable to injury during bad weather. *H. Markham.*

FRUITS OF THE MANGOSTEEN—In the issue of the *Gardeners' Chronicle*, July 16, 1892, is an article relating to the importation of ripe fruits of the Mangosteen from Trinidad. It is there stated that the Mangosteen was almost the only fruit worth eating which the Queen had not tasted. This is incorrect, the Mangosteen having produced ripe fruits in the gardens of the Duke of Northumberland at Syon in May, 1855, ripe fruits of which were on that occasion presented to Her Majesty. Thus Trinidad cannot claim to be the first to afford Her Majesty the opportunity of tasting what is so often called "the finest fruit in the world." The Mangosteen, as flowered and fruited at Syon, will be found figured and described in Curtis' *Botanical Magazine*, vol. xi., May, 1855. [See *Gardeners' Chronicle*, April 21, 1855.] *William Higgin, Stanwick Gardens, Darlington.*

RHODODENDRON FALCONERI.—In your issue of June 18, p. 635, a correspondent at Ipswich described the flower of Rhododendron Falconeri as shaded lilac, saying it had flowered for the first time with him. On p. 19, vol. xii., a correspondent, "W. D. S.," says that it has flowered with him this year, and that it is primrose colour, and asks if it varies in colour, or if there are other varieties of it? Now, I think your first correspondent has *R. campanulatum*, not *R. Falconeri* at all, although I could not be positive without seeing the plant. "W. D. S." describes it as primrose coloured, but there are many colours in primroses. I think myself it is a somewhat difficult colour to describe. It seems to me the nearest colour, for it is what painters call bone-white, although there are Primroses that will match it exactly, so there is no doubt "W. D. S." has the true variety. He then asks if any correspondent can

say if it changes its colour, or if there are other varieties of it? I do not think there are other varieties of that species, the form being quite distinct from any other; neither do I think it varies in colour. I have it here in quite different positions and soils, but its flowers are the same. I have had about eighty trusses on one plant, about 10 feet in height, and it was a grand sight; but, as a rule, it does not flower every year, but every two years—but it is a most noble variety. *J. Sharman, Rozel Bay, Jersey.* [The colour is dead white, with the faintest shade of yellow, and there is a lilac or pale violet suffused spot at the base of each segment of the corolla. Ed.]

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

JULY 12.—Present: Dr. M. T. Masters (in the chair), the Rev. W. Wilks, Dr. Müller, Prof. Church, and Rev. G. Henslow, Hon. Sec.; visitors—Prof. Emory Smith of the Leland Stanford Jr. University, California, and Dr. Kränzlin of Berlin.

Termes at La Rochelle.—The secretary read a letter received from Mr. Warburton, giving further details of the injuries done by *Termes lucifugus* at La Rochelle. He believes it to have been imported from South America. He says, "It cannot now be got rid of, as it has spread too widely—not only at Rochelle, but at Rochefort, up the river Charente, and at Saintes. I am not certain as to what plants it has attacked, but Pelargoniums and Dahlias are among them. It has destroyed Vines, and any other plants it has come across, such as fruit trees and most flowers. It lives in wood principally, consequently it does damage to plants only in or near houses. As the ants can only move underground in subterranean galleries, I do not think they could do much harm in open fields, where the galleries would always be destroyed by tillage operations. The *Termes* only spreads in two ways, as far as I can ascertain—namely, by the wood in which it exists being carried to other places, and by eating its way from one house to the next. This last process is a very slow one. I do not think that the *Termes* exists in any other part of France than that part of the Charente Inférieure, extending from the entrance of the river Charente to some distance up its course, so far, in fact, as the cargoes of wood from South America used to be carried up in ships in the last century; and at La Rochelle and Saintes, which were both great places for this import in olden times."

Tomato and Sulphate of Copper.—As another instance of the possibly injurious effects of this substance, Dr. Masters mentioned that M. Cornu found that its application, though given in the prescribed quantity, proved fatal to the foliage of the Tomato. Prof. E. Smith was asked if Tomatos and Potatos suffered in California as here, with the same fungus, *Phytophthora infestans*. He replied that though Tomatos are grown in 100-acre tracts, there is no disease to which they are subject, though Potatos are, if not to the same or at least to an allied form of fungus.

Calochilus.—Mr. Ware sent a spray of this Australian Orchid. It has an erect oscillating and fringed lip, the column being declinate, and the whole flower a delicate mauve colour. Dr. Kränzlin observed that it is very difficult to cultivate, as the natural conditions of its native habitat cannot easily be supplied.

Pinus sylvestris Injured.—Dr. Masters showed a drawing of a bough of this tree which he had observed at Boscombe. It had, apparently, been split longitudinally in three pieces. They, however, were re-united beyond the spaces injured. No cause could be assigned for the remarkable occurrence.

Dianthus Attacked by Fungus.—Rev. W. Dod sent some specimens of different species attacked with fungi. They were sent to Kew for examination and report.

Æcidium on Paris quadrifolia.—Dr. Plowright forwarded specimens with the following communication:—"During the present summer Mr. W. Thompson, of Carlisle, and I have been engaged in working out the life history of this *Æcidium*. The details of our work we hope shortly to publish. In the meantime it seems desirable to state briefly that we find the *Æcidium* on *Paris quadrifolia*, which occurs near Carlisle, is connected with a *Puccinia* allied to

P. sessilis, *P. digraphidis*, and *P. Phalaridis*, which species, it will be remembered, have their acidiospores on *Allium ursinum*, *Convallaria majalis*, and *Arum maculatum* respectively. The Carlisle *Puccinia* was found by us to germinate freely from the end of April till the middle of May. Applied to the above named host plants it produced no result, but succeeded upon *Paris quadrifolia*, on which plant it gave rise to *Spermogonia* followed by *Æcidia*. The resulting acidiospores were applied on June 10 to the foliage of *Phalaris arundinacea*, which in 20 days bore a *Uredo* with dark orange or reddish-brown spores. Further details of our culture will be published shortly."

Cronartium ribicola.—Dr. Plowright sent specimens of this fungus, observing that they were gathered on July 3, in the garden of Mr. C. J. Boyes, Oakwood House, Setch, near King's Lynn. "For several years past I have been looking out for this fungus, but until the above-named day without success (see fig. 23, p. 135). It occurred on black, white, and red Currant bushes in both stages—viz., *Uredo* and teleuto spores. The parasite was found sparingly in two gardens adjoining Oakwood House. Several Pines of various species are growing in these gardens, but the season is too advanced for the *Peridermium* to be encountered in its perfect stage." Dr. Masters observed that this disease on *Pinus Strobus* has been known for several years, but it is only now that the fungus has been found in England on Currant bushes by Dr. Plowright.

Daisy, Monstrous.—Dr. Masters showed drawings of a very unusual form of flower, in which the disc florets had cohered into a campanulate cup, the styles and stigmas uniting into a column. A detailed examination, with figures, will shortly be published.

Tsuga Pattoniana and T. Hookeriana.—He also showed branches of these trees, pointing out the differences. Professor E. Smith remarked upon the great differences which obtain between the maritime horizontal form of *Cupressus macrocarpa* and the erect fastigiate inland variety. Mr. Henslow alluded to the fact that the *Deodar*, so different from the *Cedar of Lebanon* in habit in this country, resembles it in its native home on the Himalayas.

Carnations Attacked by Hylemyia Grubs.—In response to the request for observations made by the Scientific Committee, "W. D." writes as follows to the *Journal of Horticulture*, July 14, p. 33:—"The earliest stage of the operations of the grub is to be seen about the early part of June, and any symptoms of decay in the main or lateral stems of the plant should be examined, when a very small yellow grub will be found, changing to a nut-brown colour as it gets older, eating out the heart of the stem, but it cannot be seen until the attacked part is cut away and examined. It also attacks the young foliage and eats its way into the 'grass' (young leaf-shoots at the base of the plants), and any indication of curling or decay should lead to immediate examination. The grub ultimately turns to a small brown chrysalis about a quarter of an inch long. The only remedy is frequently and closely searching, examining, and hand-picking."

University Horticultural Education.—Professor Emory E. Smith gave an interesting account of the new Horticultural Department of the Leland Stanford Jr. University of California. He stated that this great University, which opened on October 1 last, is located about 30 miles from San Francisco, in the heart of one of the largest fruit districts in the world; and had a first endowment of over £4,000,000. The endowment being ample, no fees are necessary, the education being practically free, students only having to arrange for board, books, and clothes. Belonging to the University there are about 40,000 acres of rich land, about 1100 of which are already in bearing as vineyards, a considerable tract being orchard-land. Immediately surrounding the University buildings there are 8000 acres of rich land. Upon this is already located one of the finest stock-breeding farms in America. Something like 1000 acres of this tract will be planted as orchard, and about 100 acres will be used for illustrative horticultural work of various kinds; 250 acres will be devoted to landscape gardening, and about 100 acres to botanical purposes. This is the first University in the world to elevate horticultural education to its true place of dignity among the arts and sciences, by making it one of the leading features of the Institution. It will be noted that, in this case, horticulture has been severed from agriculture, and has been made entirely independent of other departments. Regular students from any part of the world of sixteen years of age or over can enter the University by passing a satisfactory examination.

There is also a provision for the entry of special students of any age or degree of proficiency, without any fee or examination, but simply upon the recommendation of the professor in charge of the department in which he desires to work.

The one idea held in view by the Department of Horticulture is to harmonise and teach simultaneously the practice and theory of horticulture, and to make the subject so attractive that many will seek this class of education, and follow horticultural industries rather than those which at present are made educationally more alluring; so that the brighter youths of the rural district who now flock to the cities will rather be drawn towards rural pursuits than city professions. It is hoped, by thus aiming at the highest possible horticultural education, to elevate horticulture into a recognised position of equality with the most dignified arts and sciences. Degrees will be given in horticulture of equivalent value to those in other departments of the University, when the students have acquired the necessary proficiency. The first degree can be obtained by students in horticulture after four years' satisfactory work. After this three years of independent work are provided, giving the student every opportunity to make original investigations and conduct experiments, as well as follow out any line of practical work; thereby enabling him to earn still higher degrees. As an illustration of what we hope to do, a class will plant say 50 acres in orchard, and the students before acquiring their first degree, will not only have budded and grafted the trees, but will have pruned and brought them into bearing, packed the fruit and shipped it, and kept accurate accounts of their operations.

Of course, at the same time that students are carrying on their practical work in the field, regarding which they have no discretion outside the directions of the professor in charge, they will be conducting their scientific studies, such as entomology, botany, geology, ornithology, zoology, agricultural chemistry, &c. The chief branches of the department (any special one of which students may follow out as a specialty for the three years after obtaining their first degree, and all of which have to be taken in the general course) are fruit culture, fruit preservation, vegetable growing, floriculture, and landscape gardening. One feature of this system of education is that each student must at some period previous to taking his first degree, work for several weeks in one of the best nurseries, canneries, greenhouse establishments, &c., in the country, under the direction of the regular superintendents of the several establishments. This enables the student upon taking his first degree to decide which industry he may prefer to make the chief object of his three years' independent work and study, for the constant aim will be to teach the commercial aspect of every problem as thoroughly as the scientific and operative sides.

Special students who do not pass examinations will have every advantage in the class work; and while they cannot secure degrees they can earn certificates of proficiency, stating the length of time they have worked in the department, and the degree of excellence attained. We are inclined to inaugurate a system of examination quite different from that usually in vogue. The student will be required each day, or at frequent intervals throughout the terms, to give the day following the performance of certain practical or scientific operations both a written and verbal account of the work accomplished. The excellence of these reports, and the general standing of the students in their classes throughout the year, will rather determine their fitness for acquiring degrees than the old-fashioned final examination. At present there are about 520 students at the University, and in October next there will be about 1300; but in following years, when more buildings have been erected, the number will probably be more than doubled. A number of these students are entering, or preparing to enter, the horticultural department. It will be understood that the examinations in this University, and the mental attainments required of the student, are on a par with those of Oxford, in England, and it will thus be seen that a bid is made for students of first-class ability. A large number of the first horticultural authorities in America have been consulted regarding the formation of this department of horticulture, and general satisfaction was expressed at the plans under which the work is, and will be, carried on. The students' expenses at the University need not exceed £5 per month, the charge for board and room being £4 per month, the actual cost to the University. Students who are industriously inclined can

frequently work their way, and scholarships will be offered to those showing great progress in their studies.

This, it will be understood, is a very brief and general outline of the great work in hand, as it would take too long to develop the ideas and plans in detail.

An unanimous vote of thanks was given to Professor Smith by the members of the Scientific Committee for his most interesting account.

JULY 26.—We have not witnessed so large and generally pleasing exhibition at the Drill Hall for some long time. The National Carnation and Picotee Society occupied, with its pretty exhibits, very good in quality, in spite of the unkindness of the weather of late, a good amount of tabling. Gloxinias and Begonias, besides a new South African annual, *Nemesia strumosa* sp. of brilliant and varied colour, from Reading; *Caladiums*, *Sarracenias*, *Nepenthes*, and other insectivorous plants, from various sources; a few choice and novel forms in Orchids, considerable quantities of hardy border flowers, Lilies, together with a large quantity of hardy fruit of much merit, were amongst the principal items shown on this occasion.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and O. Thomss, H. Herbst, B. Wynne, C. F. Bause, F. Ross, Norman Davis, J. Laing, and W. Watson.

Messrs. Jno. Laing & Son, Forest Hill, had an extensive group of well-grown *Caladiums*, including the choicest varieties. Some of the larger specimens were *Albo-lutea*, *Madame Mercier*, B. S. Williams, and *Madame Imbert Kachlin*; also a collection of decorative Carnations, and many varieties of *Pentstemons*, some *Zephyranthes*, &c. (Silver-gilt Banksian Medal.)

Messrs. Sutton & Sons, Reading, showed a batch of their well-known strain of *Gloxinias*, and obtained an Award of Merit for *Her Majesty*, a pure white variety of great size and substance; *Invincible Purple*, a handsome flower, of wonderful good habit; and some of the netted varieties, in shades of pink and mauve, &c., were very beautiful. Messrs. Sutton & Sons also exhibited some plants of the new cross-bred *Begonia Meteor*, suitable for window-boxes, bedding, &c. It was obtained from a cross between B. Pearcei and B. "phosphorescence," the former species being the seed-bearer. The hybrid has the acaulescent habit of B. Pearcei, but blossoms more like B. "phosphorescence," which are bright carmine. It is stated to grow only about 4 to 6 inches high, and all the flower-spikes are produced from the base.

Mr. T. S. Ware, Tottenham, had cut flowers of single and double *Begonias* of great merit. *Princess May*, a large double white variety, received an Award of Merit, as did also *Baronne de St. Didié*, with primrose-yellow flowers, also double (Vote of Thanks). Messrs. Pitcher & Mander, The United States Nursery, Hextable, Swanley, had cut flowers of herbaceous plants, including *Monarda didyma*, *Achillea*, *The Pearl*, and the effective purple spikes of *Liatris spicata*.

Messrs. Jas. Veitch & Sons, Chelsea, had some examples of insectivorous plants in *Cephalotus follicularis*, *Sarracenia Courtii*, *S. Wrigleyana*, *S. porphyronera*, *Dionæa Muscipula*, *Drosera capensis*, and *Nepenthes Amesiana*, *N. Wrigleyana*, *N. Burkei excelsa*, and *N. Mastersiana*, one of the finest of the dark-coloured varieties; also some cut blooms of varieties of *Rhododendron javanicum-jasminiflorum*. Some very fine-flowered plants of *Lilium araturum* and *rubro-vittatum* also came from Messrs. Veitch. Messrs. B. S. Williams, Upper Holloway, exhibited about one dozen species and varieties of *Sarracenias*, and three of *Nepenthes*, also *Cephalotus follicularis*, *Pinguicula caudata*, and *Dionæa Muscipula* (Vote of Thanks). A large exhibit of *Sarracenias* came from the United States Nursery, Hextable, Swanley, of Messrs. Pitcher & Manda; the varieties seemed small and immature as regards the pitcher. We observed many plants of *S. Mitchelliana*, and *S. M. maxima*, some of *Tolliana*, *Swaniana*, *Wrigleyana*, *Variolaris*, *Flambeau*, *rubra*, *purpurea*, *flava maxima*, *formosa*, *illustrata*, *Courtii*, *Vittata maculata*, one of the few that possessed high colour; *Stevensii*, &c. *Dionæa Muscipula* and a *Darlingtonia* were to be seen in the group (a Silver-gilt Flora Medal).

A very extensive collection of cut flowers came from Messrs. Paul & Son, Cheshunt, comprising herbaceous plants, such as *Lilium* in variety, *Euothena Youngii*, *Veronica angustifolia rosea*, *Actæa racemosa*, *Echinops ruthenicus*, &c.

A couple of dozen plants of *Disa grandiflora* in bloom, and an extensive collection of cut *Roses*, which Mr. Paul says are just in high flower with him at the present time. The same firm had also a large number of hardy border Carnations and Pinks (Silver Gilt Flora Medal).

Messrs. Clibran & Son, Oldfield Nursery, Altrincham, exhibited blooms of a so-called *Eucharis Clibrani*, obtained from a cross between *E. grandiflora* and *Urecolina pendula* (aurea). The blossoms are white, and are more campanulate than any of the *Eucharis* hybrids yet raised, and will no doubt be regarded as a novelty worthy of attention.

Mr. Wytbes, gr. to the Duke of Northumberland, Syon House, Brentford, showed sprays of *Clethra arborea*. This is a greenhouse tree of 15 feet to 20 feet high, producing racemes of white fragrant flowers from the points of shoots. Leaves are leathery, and resemble those of a *Rhododendron*.

Mr. Henry Eckford, Wem, Salop, received a Vote of Thanks for a number of distinct hybrid Sweet Peas, in very beautiful shades and colours. An Award of Merit was granted to a variety called *Lady Beaconsfield*.

Mr. Jas. B. Riding, Chingford Nurseries, received a vote of thanks for some very fine flowers of *Gloxinias* in variety; and Messrs. Cannell & Sons, Swanley, a Bronze Banksian Medal, for really charming blooms of *Tuberous Begonias*, single and double. Mr. W. Marshall was awarded a First-class Certificate, for *Aster diplostephioides*, a beautiful large white flower, with purple blotch in centre; and an Award of Merit for *Crocus aureo-imperialis*. W. A. South, Esq., Neasden, N.W., exhibited a plant of *Dasylium* in bloom, some 14 feet high (Vote of Thanks). Messrs. Jas. Green & Nephew, 107, Queen Victoria Street, E.C., had a stand with samples of Munstead flower-vases in green and white.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien, Sydney Courtauld, T. B. Haywood, A. H. Smea, J. Jaques, Jas. Douglas, W. H. White, Ed. Moon, Chas. Pilcher, Thos. Bond, H. Ballantine, and H. M. Pollett.

Cattleya Rex (illustrated in *Gardeners' Chronicle*, February 28, 1891, p. 273), was exhibited by Welbore Ellis, Esq., Hazelbourne, Dorking; and by H. M. Pollett, Esq., Fernside, Buckley. Both plants showed the accuracy of the illustration, and the distinctness of the plant itself, but neither, it was said, were so good as the original, or the one which flowered with Mr. Statter. A First-class Certificate was awarded.

Messrs. F. Sander & Co., St. Albans, exhibited a small group, comprising *Cattleya Gaskelliana alba*, *C. Schofieldiana bella*, a very large form; *Odontoglossum Schroderianum*, the curious little *Angraecum distichum*, *Cypripedium callosum pulcherrimum*, *C. Dayanum superbum*, two *C. Chamberlainum*, several new hybrid *Cypripediums*, and the singular bluish-white *Cynorchis tophylla*.

Messrs. Hugh Low & Co., Clapton, also had a small group, the prominent feature in which was *Cattleya Schilleriana Lowii*, a most remarkable novelty with flowers similar to the type so far as the sepals and petals are concerned, but the lip is white, beautifully veined with dark lavender-blue; the whole lip much resembling that of one of the lesser forms of *Zygopetalum Mackayii* (First-class Certificate). *Aerides J'Ansonii*, also in Messrs. Low's group was remarkable; also *Sobralia Lowii*, *Lælia amanda*, *Cypripedium De Witt Smith*, *C. ænanthum* and *Mitonia Moreliana atro-purpurea*. Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray), sent *Cypripedium Youngianum superbum* (*Philippinense* ♂, *superbiens* ♀), which had the general aspect of *C. Morganii*, but the petals are much broader and flat (Award of Merit). Another fine hybrid from the same exhibitor was *C. Bryani* × (*Argus* ♂, *Philippinense* ♀), a very handsome hybrid, with broad, deflected petals, heavily blotched with blackish-brown, and white upper sepal, greenish at the base, and with narrow purple lines radiating from the base. Lip greenish-white, tinged light brownish-rose (Award of Merit). Mr. Cookson also showed *C. Youngianum* ×, *C. Tautzianum* ×, and a spike of *C. Morganii* ×.

G. R. Le Doux, Esq., Langton House, East Moulsey, showed a small group, in which were several good forms of *Cattleya eldorado* and *C. e. Wallisii*, *Odontoglossum citrosuum*, *Oncidium trulliferum*, *Mitonia vexillaria*, and the curious *Celoglyne peltastes*, which was awarded a Botanical Certificate.

Messrs. Pitcher & Manda, the United States Nur-

series, Hextable, Swanley, exhibited *Cypripedium Stonei candidum*, *C. tomsum*, *C. Ashburtonia expansum* ×, *C. javanicum superbum*, two plants of a dark form of *C. grande* ×, *C. Curtisii*, *C. superbiens*, *C. chlorops* ×, *Saccolabium Culeste*, &c. C. J. Lucas, Esq., Warnham Court, Horsham, showed *Eria vestita*, a tall-growing species, with fleshy leaves and long racemes of white flowers, the whole plant flowers, and all being covered with reddish-brown hairs. Also cut spike of *Cattleya Warszewiczii*, with one of the flowers abnormal. F. Wigan, Esq., Clare Lawn, East Sheen (grower Mr. W. H. Young), showed a fine plant of *Platyclinis filiformis*, with about seventy spikes (Cultural Commendation); *Dendrobium Leeanum atro-purpureum*, a fine spike of *Stauropsis Lissochiloides* (*Vanda Batemannii*), and a spike of the light form of *Lælia elegans*.

From the Marquis of Salisbury's gardens, Hatfield (gr., Mr. Norman), came six fine spikes of *Saccolabium Blumei*, for which the gardens are noted.

J. F. Alcock, Esq., Northchurch, Berkhamstead (gr., Mr. Wade), sent a plant of *Mormodes citrinum*.

Chas. Winn, Esq., Selby Hill, Birmingham, sent his new hybrid *Cypripedium* × *Edith Winn* (*C. Stonei* ♀ *C. purpuratum* ♂), which showed marked traces of *C. Stonei*, and evidence of merit when stronger. The Committee requested to see it again.

P. McArthur, The London Nurseries, Maida Vale, sent good forms of *Cypripedium superbiens* and *C. Godefroyæ*; and C. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), exhibited *Cypripedium Hecla* × (*superbiens* ♀ *Swanianum* ♂); *C. × The Gem*, (*marmorophyllum* ♀ *insigne Chantii* ♂); and *C. × Bijou* (*ænanthum* ♀ *Lawrenceanum* ♂).

Fruit and Vegetable Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. W. Warren, G. T. Miles, A. Dean, W. Bates, J. Willard, G. H. Sage, A. H. Pearson, J. Hudson, F. Q. Lane, H. Balderson, G. Norman, J. Smith, W. H. Divers, Robert Hogg, T. F. Rivers, R. D. Blackmore, Harrison Weir, W. Wilks, H. J. Pearson, J. Cheal, and T. J. Saltmarsh.

There were some excellent examples of Peaches, Cherries, Gooseberries, Tomatoes, &c.

Messrs. James Veitch & Sons, Chelsea, had a splendid collection of Gooseberries, especially so when we remember that, on the whole, the fruit is not quite up to the usual standard this season. The varieties staged numbered about eighty, and the following were the best of these. Reds:—Highlander, Dan's Mistake, Industry, Clayton, Companion, Yellows: Pilot, Leveller, Leader, Mount Pleasant, Tiger, Trumpeter. Greens: Surprise, Telegraph, Keepsake, Green Overall. Whites: Eva, Flora, Freedom, Miss Nightingale, Moreton Lass, and Ostrich. Dessert: Green Walnut, Green Gascoigne, Early Green Hairy, Early Red Hairy, Early Sulphur, Golden Drop, and Whitesmith. These were all gathered from bushes or cordons of two years old. From the same exhibitors came also five baskets of Cherries in as many varieties, from pyramids, and three dishes of white Currants (Silver Medal).

Messrs. T. Rivers & Son, Sawbridgeworth, contributed a collection of fruit (twenty dishes). The quality was of the finest throughout, and the Cherries and Peaches attracted a great deal of attention. Some fruits of Rivers' Albatross Peach, grown in a warm-house, were very fine; but the variety seems to lack colour. Stump the World under the same condition carried much better colour on somewhat smaller fruits. Peach Early Rivers had been grown in a cool-house along with Lord Napier Nectarine, and the dozen fine fruits of the Peach were well ripened, whilst the Nectarines were quite hard. Hale's Early Peach was represented by two dozen very handsome well-coloured fruits from a cool house. Early Rivers' Nectarine had also been grown in a cool-house, and received a First-class Certificate. Several good seedling Peaches and Nectarines were included in the collection, and one of these Peaches struck us as being exceptional. It was the same colour as a first-class coloured Apricot. Of Cherries, there were twenty varieties, and a finer lot could scarcely be seen. These included Turkey Black Heart, Early Rivers, Bigarreau Noir de Schmidt, Bigarreau de Schrecken, large Black Bigarreau, and Bedford Prolific, all black varieties; and Emperor François, Bigarreau Napoleon, and Bigarreau Monstrueuse de Mezel, red; and also the White Bigarreau.

Mr. R. Gilbert, High Park Gardens, Burghley, excited much interest and comment by some remarkably large fruits of Tomato Royal Sovereign, the

seven fruits weighing 10½ lb. (An Award of Merit.) Mr. George Groves, gr. to General Owen Williams, Temple House, Great Marlow, Bucks, obtained an Award of Merit for some fruits of a seedling Tomato obtained from "Maincrop." The fruits were medium sized, and smooth skin.

Mr. W. H. Divers, Kutton Hall, Stamford, had eight dishes of first-rate Peaches, Princess of Wales, Sea Eagle (especially large and good), Barrington, and the Nectarine Peach. (Silver Banksian Medal.)

Lord Foley, Ruxley Lodge (gr., Mr. J. Miller), exhibited a dozen fruits of Grosse Mignonne Peach, and a seedling Melon. (A Vote of Thanks.)

Messrs. Carter & Co., contributed bine and fruits of their new Pea, "Daisy," which appeared to be a good large pea, and a heavy cropper.

Mr. Wythes, gr. to the Duke of Northumberland, again exhibited some seedling Melons, one obtained from Wu. Tillery and Eastnor Castle varieties, and another from Syon House and High Cross hybrid, and a third from Eastnor Castle and Syon House. Mr. G. H. Sage, Ham House, Richmond, obtained an Award of Merit for a seedling Melon called Emerald Gem, an American variety. The fruit was rather small, deeply ribbed, and it is described as being a very free-fruited variety; flesh red, and flavour very good. Another seedling, Yellow Gem, came from Mr. J. Pitt, Panshanger Gardens, Hertford. From the Royal Gardens, Windsor, came half a dozen fruits of a seedling Melon, four fruits of Scarlet Princess, and two fruits of Countess Melon. This latter variety is a pretty yellow-coloured fruit. Mr. Owen Thomas, Frogmore, also sent three dishes of Peaches, the following two were ripened out-of-doors, Waterloo and Early Rivers. The other dish was Walburton's Admirable, and consisted of ten very handsome fruits (Bronze Medal). Messrs. J. Hammond & Son, St. Ann's Hill Nursery, Carlisle, sent some well-fruited shoots of a seedling black Currant, W. E. Gladstone, the fruits being large and of good flavour.

LECTURE ON INSECTIVOROUS PLANTS.

In the afternoon a paper on the above subject was read by Mr. A. J. Manda, of the United States Nurseries, Hextable. There was, he said, a great number of species and varieties, many of which he regarded as natural hybrids.

Alluding to *Cephalotus follicularis*, the lecturer said it was a native of King George's Sound, and was introduced into this country some seventy years ago, although it was still considered a novelty. Although this was an insectivorous plant, the best results could be obtained by cultivating it and feeding it in the ordinary manner from the roots, and insects might be entirely excluded by means of a bell-glass.

Dionæa Muscipula (Venus's Fly-trap) could also be grown to greater perfection, by excluding insects, and feeding from the roots.

The genus *Drosera* or Sundew, of which the European species *D. rotundifolia* was well known, embraced a vast number of beautiful species, which are spread over many parts of the world.

Of the genus of *Nepenthes* (see fig. 19), Mr. Manda said that a liquid is produced in the pitcher before the lid is opened, and that when once opened this lid never closes. To cultivate them here, they required a warm, moist temperature, and plenty of water and syringing. The drainage must be exceptionally good, that all fear of sourness be avoided. Good fibrous peat, with the small taken away was the best soil, and in the summer the temperature should never be permitted to fall below 75°. They would require less water in winter.

Sarracénias (the Side-saddle Flower), see fig. 20, inhabited heaths and bogs, where water is abundant. Grown here, with root-wood alone, they were finer than any in their natural homes. *S. rubra* had a delightful fragrance, and to cultivate these plants great heat was not required. In winter they should rest in a cold frame, which would only prevent frost from reaching them, and if they were plunged in moss, they would keep sufficiently damp without watering. In March they should be cleaned and repotted, or top-dressed and placed in a moist house, with temperature about 60°. Give plenty of water and syringe carefully, so as not to break the young growths. Keep close whilst pitchers are forming, for they are very soft and are easily injured. This treatment will keep away thrips and green-fly. Afterwards more air and less shade can be given, so that the various tints may be developed. The soil should be two parts fibrous peat, mixed with some nodules of charcoal and a little rough sand. The pots should be well drained with burnt breeze. The Portuguese Fly-catcher (*Drosophyllum lusitanicum*)

came from Spain and Portugal, as well as from the Mauritius. The lecturer said that this species produced beautiful flowers, but he did not think it lived long in cultivation.

In conclusion, Mr. Manda said that it was quite certain that these plants were provided with various kinds of apparatus for the catching and absorption of insects, but the supply thus afforded was not so good as could be supplied by the intelligent gardener, and those that in their homes are allowed to practise their fly-catching propensities are not so luxuriant, neither do they live so long as those that were fed through the roots in this country.

The Chairman (Mr. D. Morris) said, a good many people might be disposed to ask why these exceptional powers had been developed in these plants, and one theory was, that they grow in poor soils containing but little nitrogen, and that they obtain from the insects, &c., what they could not get in any other way. A theory is held that the juice in the *Nepenthes* does not contain much pepsine until bacteria have been developed, and have set up a fermentation. Professor Henslow said that he had no experience in the culture of insectivorous plants, but they had always been a source of great interest to him. He ventured to think that perhaps the theory respecting the relative absence of nitrogen in the soil in which they generally abound was partially right, but other plants grew aside by side with them, and it remained to be explained how it was that they obtained all they wanted, and had not developed similar characters. The Professor also thought that it was very curious that the methods of attaining the same end were so diverse. In *Nepenthes*, the pitcher was merely a developed water-gland at the apex of the leaf; and in the *Drosera*, the apparatus was a sticky fluid exuding from hairs all over the surface; and then again in the *Butterworts*, and the other species a different apparatus to each was found. It was significant that in nature they had poor little roots, and that under proper treatment, the roots greatly developed, and then the plants could be fed through these augmented roots. It seemed that they had de-generated, and were living in their natural homes as semi-parasitic existence.

Professor Williamson, of Manchester, remarked that Darwin called attention to the smallness of the roots, and he, Professor Williamson, who had cultivated them for the last twenty years, found that they grew better each generation, and that by obtaining seeds from them here, and growing them from such source year after year, they gradually recovered the position it was held they had fallen from. But, on the other hand, they must remember that Darwin studied this matter with care, and with such care as has never been attempted since, unless perhaps by some of the German botanists. He found that the seed obtained from those plants that had been fed with insects and with pieces of meat produced stronger plants than those which had derived their nourishment in the ordinary way by the roots. But after all he, Dr. Williamson, agreed that as the method of cultivating them here was better understood, and the treatment given them was more and more suitable to their growth, it would be found that that system would produce better results even than those attained by Darwin.

The Doctor then called attention to the fact that *Dionæas* were being taken from America to such an extent that it was feared that the plant would be exterminated, and urged the imperative necessity of raising our plants from seed obtained in England, and added that he had practised this plan for years with complete success.

NATIONAL CARNATION AND PICOTEE SOCIETY.

—Owing to the great pressure on our space the report of the show of the above held in the Drill Hall, James Street, Westminster, on Tuesday last, will be deferred to our next issue. The blooms were generally remarked to be fresh and large, and in the case of flaked and bizarre varieties less "run" than the wet, cold weather of late had rendered very probable.

MARKETS.

COVENT GARDEN, July 28.

MARKET brisk, with supplies good. James Webber, Wholesale Apple Market.

NOTICES TO CORRESPONDENTS.

ARBITRATION, &c.: C. P. Were we in your case we should consult a solicitor. We are unable to advise you.

AMERICAN BLIGHT ON APPLE TREES: R. N. Make use of kerosene emulsion on the stem, branches, and shoots. Recipe:—Dissolve ½ lb. hard soap in 2 quarts of boiling water, and add 1 pint of kerosene oil, and mix thoroughly; before using dilute this with 2 gallons of water for most plants. To be applied in winter, rubbing it well into the bark with a half worn-out painter's brush. The roots should be laid bare, and the soil saturated with soap-suds. This will kill the insects that infest these. Fresh soil should be filled-in over the roots, and both operations will need to be repeated for several years, and the soap-suds watering two or three times in the year, at any season.

CHANCE SEEDLING PEA: R. P. An excellent variety and worth preserving; pods long and well filled with seeds, of a bright green colour.

CORRECTION: In our last issue we mentioned a class in practical horticulture as conducted in Suffolk by Mr. Jordan. The class in question was conducted by Mr. Sheppard, of Woolverstone Gardens, and the comments made apply to that gentleman. How the mistake originated we cannot divine, but we are pleased to be able to make the correction.

FARGUGHUM GRANDE, *syn.* LIGULARIA KEMPFERTI AUREO-VARIEGATA: R. N. The plant was described in our pages in 1857, January 3, from a plant shown by Mr. Glendinning, of Chiswick, at a meeting of the Royal Horticultural Society, it having been introduced by R. Fortune during 1854 and 1856, and whose description of the plant was published in these pages February 25, 1860.

GLOXINIAS: A. W. F. Of no particular merit.

HAWTHORN SEEDS AND APPLE AND PEAR PIPS: *The Young One.* The first-named should be stratified as soon as collected; that is, put in thin layers with sand or loamy soil, and protected from frost, sowing them in beds in March. They do not usually appear till the second summer. Apple and Pear seeds if sown in the autumn, and the soil not allowed to freeze, will vegetate in great part the first year, and certainly all will come up the second season.

HOGGIN: C. N. Pebbles—gravel of the size of horse-beans.

LINE: C. W. D. Eggs probably of the Lace-wing moth.

MIGNONETTE: W. T. Both are excellent and desirable varieties.

MUSTARD AND CRESS AT COVENT GARDEN MARKET: W. H. The trade is in the hands of certain growers, who find no difficulty in meeting the demand. You should not engage in the business before first ascertaining by personal enquiry among market men whether a further demand is likely to arise shortly.

NAMES OF PLANTS: *Albert Butcher.* Scilla (Ledebouria) lanceifolia, or a nearly-allied species.—S. H. M. H. Pyrus aria, the white Beam. Your question should have been addressed to the editor, not to the publisher.—*Southampton.* Yucca flexilis (Y. acuminata of gardens), probably. You should have sent leaves and a flowering branchlet.—J. B. 1, Veronica spicata; 2, Echium vulgare; 3, Lamium purpureum; 4, Centranthus ruber; 5, Lysimachia vulgaris; 6, the major form of Oncidium longipes.—F. A. G. 1, Lycium barbarum; 2, Lysimachia nummularia.—R. T. Menyanthes trifoliata.—J. H. 1, Clematis flammula; 2, Taxodium distichum; 3, Staphylea pinnata; 4, Cotoneaster nepalensis; 5, a seedling Cypress, probably; 6, Lysimachia vulgaris.—J. Dittrich. Odontoglossum Lindleyanum, not O. crispum. The Dahlia is a very dark-coloured one, as you say.—G. P. 1, Lysimachia vulgaris; 2, Centranthus ruber; 3, Achillea ptarmica, fl.-pl.; 4, Lythrum salicaria; 5, Linaria purpurea; 6, Asclepias Curassavica; 7, Clematis, of the lanuginosa section.—T. & J. R. Oncidium luridum guttatum (true).—C. D. 1, Send flowers; 2, Fuschia corymbiflora; 3, Diplacus glutinosus; 4, Pteris cretica var. albo-lineata; 5, P. argyrea; 6, Cestrum faeciculatum.—C. N. A. Commelina; we cannot say which one.—H. E. Corydalis claviculata.—W. S. L. Purple fruited egg plant—Aubergine. Pea: without seeing the pods and the ripe seeds we cannot tell you with certainty what the name of the variety is. Géant, a large late French variety; Early Maple, Dwarf Gray Sugar, and many others, mostly French varieties, have violet or purple flowers.—R. G., *Beesley*, Cattleya guttata.

OWN-ROOT ROSES: T. The stronger shoots that spring from the roots should be preserved, at full length, and if they have grown to 3 or 4 feet, and you do not want them to grow much longer, fasten them in a horizontal position, or lay the upper portion for 1½ foot, you will then obtain young plants without further trouble. If you stop the shoots now, the resulting shoots will not mature, and would have to be sacrificed at the winter pruning, if not killed before. At the winter or spring pruning of the Roses, about 1 to 1½ foot, or even more, if the wood should ripen well, may be left, and the shoots springing from the pruned shoots will bear flowers. Be sure to thin out entirely, down to the old wood, or to the roots in the case of suckers, the weak shoots, and those that have not flowered during the present season; and cut back those which have flowered to about one-third their length. This last bit of work being performed as soon as the first crop of flowers is over. It applies more especially to hybrid Perpetuals, Teas, and Noisettes.

PODS OF PEAS BROWNED AND CRIPPLED: T. The work probably of thrips, although we do not find any of the insects or larvae upon the pods. Syringe the pods of such plants as are unattacked with soapy-water, in which a little tobacco-water is mixed. The syringing should be repeated.

TUBEROUS BEGONIAS: E. H. C. The blooms are very good, as regards colour and size, the single ones being amongst the largest we have noticed.

VINE LEAVES DISCOLOURED: W. H. M., *Munches.* There are no traces of insects or fungus, and in the absence of particulars as to the treatment, we should ascribe the state of the leaves to excessive sun heat and lack of ventilation.

DIED—On July 22, at Upper Edmonton, after a brief illness, HALLIE, the second daughter of HENRY B. MAY, aged 17 years.

HOUSEHOLD TROUBLES.

The supper was laid on the table trim
When out comes, roaring, my young son, Jim,
"Oh! daddy, the rats! A dozen or two
Are gobbling the supper, and baby too."
My wife, with a scream, seized iron and broom,
I clutched a bottle, and made for the room
Never was heard such a hullabaloo!
It woke up the cat, and the terrier, too.
The terrier thought we were hunting the cat,
Got a grip of her tail, as she went for the rat.

Jim, with his hatchet, tumbled over a pail,
And tried to hold terrier back by the tail,
I caught Jim by the wool, but rather too late—
The table received such a bump from his pate
That teapot, plates, lamp, chairs, baby and all,

Were upset on the floor, 'mid crash and squall.
The people about shouted, "Murder! Fire!"
And the police rushed in the cause to inquire;
They'd listen to nothing we wanted to state,
But to the next station lugged me off straight.

Swore I was drunk—nearly murdered my wife,
And of my poor infant endangered the life,
Broke tables and chairs, and the crockery ware;
When the Justice said, "What a savage old bear!"
Not heeding a word my poor wife did swear,
Imprisoned and fined, I cursed my sad fate,
When lately I learned, but rather too late,
Instead of depending on traps, dogs, or cats,
My only protection was "ROUGH ON RATS."

A LARGE COMIC LITHOGRAPH in Seven Colours, illustrating the above lines, and which has convulsed the world in laughter forwarded by Post upon receipt of 2d.

JOURNEYMAN.—Mr. IRELAND, Gardener to Viscount Portman, Wentworth Lodge, Bourne-mouth, Hants., would be pleased to recommend a young man (age 22), thoroughly respectable. Address as above.

IMPROVER.—A Lady, who has given up her establishment, wishes to recommend a youth (age 19) as above. Premium if required.—A. BOOKER, 39, Ringford Road, West Hill, Wandsworth.

TO GENTLEMEN and GARDENERS.—Situation wanted, by a respectable youth (age 20), to assist in Watering, Potting, and Tying. Both preferred.—J. T. JOHNSON, Shipton, Market Wroughton.

TO GARDENERS and NURSERYMEN.—A young man seeks situation as SECOND, or as GROWER for Market. Highest references.—F. SMITH, Headbourne, Wotton, near Winchester, Hants.

TO GARDENERS, &c.—Situation wanted, by a young man (aged 19). Five years' inside and out. Active and willing. Well recommended.—W. NEVARD, Aston Hall Gardens, Sutton Colfield, Braughing.

TO GARDENERS, &c.—Situation wanted under Glass (Trade or Private). Three and a half years in Nursery.—D. H. MILLER, Fern Lodge, Upperton, East-bonne.

TO NURSERYMEN.—A young man (age 18) wants situation in a Market Nursery; used to Ferns, Palms, &c. Good references.—H. G., Denison's Nursery, 22, Mauda Vale, W.

SHOPMAN, or ASSISTANT.—Age 26; experienced in Seeds, Bulbs, Plants, and Floral Work.—T. R., "Sharon," Southgate Road, Bournemouth.

SHOPMAN, or MANAGER.—Age 31, married; thorough knowledge of Seed, Bulb, Plant, and Flower Trade. Good references.—LOTHIAN, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W. C.

HOLLOWAY'S PILLS and OINTMENT.—Dispepsia, Jaundice, these complaints are the results of a disordered liver, which secretes bile in quantity or quality incapable of digesting food. Digestion requires a free flow of healthy bile, to insure which Holloway's Pills and Ointment have long been famous for expelling every other medicine. Food, irregularity of living, climate, & other causes are constantly throwing the liver into disorder, but that important organ can, under all circumstances, soon be regulated and healthily adjusted by Holloway's Pills and Ointment, which act directly upon its vital secretion. The Ointment rubbed on the skin penetrates immediately to the liver, whose blood and nerves it rectifies. One trial is all that is needed; a cure will soon follow.

SALES BY AUCTION.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will sell by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, August 12, at half-past 12 o'clock

ONCIDIUM SPRUCELI, LINDL.

a grand species with stout terete leaves and strong upright panicles of flowers equal in beauty to those of *O. varicosum* Rogersii. The sepals and petals are yellow spotted with red, the large lip bright yellow with red marks at the base. The plants are in grand condition and all are offered.

ONCIDIUM PAPILIO MAJUS,

the true large-flowered Butterfly Orchid, fine fresh imported plants.

DENDROBIUM SPECIES

collected in New South Wales. In habit this resembles *D. densiflorum*. Flowers white and yellow, the lip often spotted with purple. They are very fragrant, and produced freely from both young and old bulbs.

Also a few fine plants of the rare scarlet

LÆLIA MONOPHYLLA,

and other imported Orchids.

Also ESTABLISHED ORCHIDS from various growers.

On view morning of Sale, and Catalogues had.

Peasmarsh, Sussex.

By order of the Executors of the late Mr. J. Golding. To MARKET GARDENERS, FRUIT GROWERS, and others seeking a thoroughly genuine Business, established for many years.

MESSRS. PROTHEROE AND MORRIS, in conjunction with Mr. J. J. FRUIN, will sell by AUCTION, at the "George Hotel," Rye, Sussex, on WEDNESDAY, August 21, at 3 o'clock P.M., the exceedingly choice and productive FREEHOLD MARKET GARDEN and FRUIT GROUNDS, known as Little Lea, Peasmarsh, Sussex, comprising an area of 14 a. 1 r. 7 p., bountifully stocked with the best marketable kinds of top and bottom Orchard Fruit Trees. Also the convenient detached Residence, Stabling, and Outbuildings.

The Property may be viewed any time prior to the Sale. Particulars and Plans may be had at the place of Sale, of Messrs. DAVENPORT JONES and GLENISTER, Solicitors, Bank Buildings, Hastings; of Mr. J. J. FRUIN, House and Estate Agent, 31, White Rock Place, Hastings; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

WANTED TO RENT, a SMALL NURSERY or GARDEN, suitable for Market Work, near a good Town. Apply.

Mr. G. EBURY, 14, Fairfield Street, Kidderminster.

WANTED, a NURSERY and FLORIST BUSINESS. House and Shop, with Conservatory or small Glass Nursery adjoining. Full particulars to A., 15, Ancona Road, London, N.

KENT.—MUST BE SOLD. Great sacrifice. MARKET NURSERY, 10 modern Greenhouses, 4 acres of Ground, Personally inspected. Only about £400 cash required. Particulars of Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

TO BE SOLD, as a thorough going concern, the LEASE, over 19 years, and 7 Greenhouses, over 700 feet run, all heavily cropped with Peaches, Tomatoes, and Cucumbers. Situate in a town of 12,000 inhabitants, within 20 miles of Covent Garden, and close to station. Room for another 600 feet run of Glass. Would suit two young men excellently, and altogether is an opening seldom occurring. The best of reasons will be given for leaving.—X. Y., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO BE SOLD, the Lease, Stock, and Goodwill of a small FLORIST and JOBBING BUSINESS in a good position. Good Dwelling house and Stable; Greenhouses, Pits, &c., heated with hot water. To be had a bargain if sold at once. Satisfactory reasons for disposal. Apply, G. L. WEBBS, Newsagent, Grove Road, Holloway, N.

To Nurserymen.

FOR IMMEDIATE DISPOSAL, a good and well-paying NURSERY BUSINESS, in North London: ten long Greenhouses, 1000 feet of Pipe, with Boilers in good condition, upwards of 10,000 Greenhouse Ferns, and other plants, Trade Utensils, and a useful Horse and Van. Rent of Ground, £10 per annum.

KELF AND SON, Auctioneers, Upper Edmonton.

LONDON, S.E.—TO BE SOLD (Owner having bought a larger Business), a compact well situated NURSERY and FLORIST BUSINESS, $\frac{3}{4}$ miles from Covent Garden. Five Greenhouses (3,300 feet of glass). Rent, £10 per annum. Also, if desired, Shop in main road close to railway station. Lease (sixteen years to run), Goodwill, Houses, Stock, Tools, &c., £250, or near offer.

H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO JOBBING GARDENERS.—Ealing, best part, a four-roomed COTTAGE and three-quarters of an acre of GROUND, recently Nursery. No Glass. BETA, News, Stationer, Spring Bridge, Ealing.

TO BE LET or SOLD, a well-stocked FRUIT GARDEN, about 5 acres, with Glass. Occupied forty years by present owner.—R. CLARKE, Twickenham.

HERTFORDSHIRE.—Eleven miles from London, convenient to Station. Important to Gentlemen fond of Horticulture, Florists, and others. THE Gardeners' Chronicle.

SATURDAY, AUGUST 6, 1892.

BUDDING.

ALL rosarians, professional or amateur, have for the nonce changed their creed, and instead of paying their devotions to the lovely blooms they have gloated over for some weeks, have turned their attention to the wood—they have all, in fact, become Buddists, not worshippers of Gautama of the golden tooth, but of pagans of the budding knife; and according to their needs, so is the extent of the devotion, from the amateur who has only to do a few dozen to the grower for sale who has, perhaps, his hundreds of thousands to finish off before the month of August is well over. It is not my intention to describe a process so simple and so well understood, but to deal with a few collateral issues which are of importance, and deserve to be carefully considered. The season is favourable in many respects, and as there have been great losses amongst Roses owing to the two last winters and springs, probably a larger number than usual will be operated upon.

1. *Time.*—This is, I think, a question entirely to be decided by the state of the stock and buds to be used. It may sometimes happen that the former is sooner ready than the latter, and *vice versa*; but when the bark of the stock rises freely, and when the buds of the Roses to be used are sufficiently developed, then I think any time from the middle of June to the middle of September may be utilised for the purpose. The month of July has generally been considered the best month, and so probably it is. Those buds which are inclined to grow have a good time to show themselves, but most growers, I think, prefer the buds to lie dormant during the winter. Cool days should be chosen, if possible, and morning and evening rather than midday; but a rosarian's own sense of comfort will quickly lead him to the same conclusion. Standards are all very well, but to kneel down to bud the dwarfs in a broiling sun is a process which is the reverse of agreeable, and one which the rosarian will try to avoid as much as possible.

2. *Stocks.*—There are now, we may say, two kinds of stocks on which the operation has to be performed, the Brier and the Manetti, the former being again subdivided into standards, Brier cuttings, and seedling Briers. The former is very little used now by amateurs, except in the case of Tea Roses, the general consensus of opinion being that either standards or half-standards form the best stock for this class, and this is the easiest operation that the rosarian has to perform. The plants are at the proper height, with little or no stooping to be endured, and the operator feels this is the sort of thing that suits him: but, as for hybrid perpetuals, he does not give them a standard, and by most opinions are divided as to the value of the Brier cuttings or seedling

Brier, but the buddist does not always recognize that the seedling Brier is objectionable. Its thin small stem, added to the necessity of inserting the bud close to if not underneath the level of the soil, constitute a task he by no means relishes. The Brier cutting, on the other hand, gives him stouter material to work upon, and he can get through it better.

There remains but the Manetti, the most

FIG. 24.—A METHOD OF SEPARATING THE SHIELD FROM THE WOOD WITH A SILK THREAD, WHICH SUCCEEDS ADMIRABLY IF THE BARK RUNS EASILY, THE BUD BEING DETACHED WITHOUT INJURY.

favoured of all stocks, its bark rises so easily, the wood is so stout, and the vigour of the stock is so great, that it is no wonder so many prefer it; the Rose foreman of the nursery can tell you what number he and his mates can get through in a day, and what a pleasant operation it is. The number, however, of hybrids budded on Briars is yearly increasing, and some growers profess that for all kinds of Roses the Brier is to be preferred.

The Bud.—I think that more importance ought to be given to this subject than has hitherto been done, and greater care exercised by the amateur who buds his own Roses, and has the matter under control. It is a law of Nature that like produces like, and the principle of heredity has come to be more fully recognized than it used to be; it holds good in the vegetable as well as the animal kingdom. No one who has an inferior animal cares to breed from it,

FIG. 25.—THE USUAL MANNER OF TAKING THE BUD FROM A SHOOT.

and the last thing I suppose a gardener would dream of if he had a fruit tree which either bore inferior fruit, or was barren, to propagate from that tree. Now there are some things that seem to me to point to the existence of the same state of things in the Rose. Take for example what are called "sports." One branch of a bush or tree shows a departure from the type which it is considered desirable to propagate; the buds must all be taken from that one branch; for this purpose it would not do to take it from any other part of the bush, but the buds on that one

branch may all be expected to be of the same character; sometimes, indeed, it appears difficult to permanently fix the sport, and there is a tendency to revert to the type.

Again, other branches of a bush may be blind, that is, produce no flower buds, and this is the case with some Roses more than with others; while, again, I think most Rose-growers have noticed that the blooms on one bush are inferior to those of another of the same variety; they are thinner, and less satisfactory. These facts all point to a difference of strain in many of our Roses, just as, again, we see many varieties altered in constitution so as to become climbing Roses instead of being dwarf close-growing. I therefore hold it to be a matter of paramount importance that the utmost care should be taken in the selection of buds. In the first place, I do not think that any bud should be taken from a flowerless shoot. It might get over this habit in the next season, but, as a rule, I think not, and that it, and anything propagated from it, will disappoint the grower. In the same way, where sports have to be budded from, care must be taken that the buds be taken from a flowering shoot. Sometimes a shoot is strong, has good fat-looking buds, and the grower may be tempted, although it has not flowered, to use them. I think that he had better not. I do not suppose that this has been absolutely proved, and therefore we can but act on inference, but I believe it would be found to be correct if the matter was really tried. The same where sports have to be propagated; the greatest care should be exercised only to use those buds where the sport has remained constant. A friend told me that out of a row he had budded of

FIG. 26.—SHOWS THE SHIELD IN PROCESS OF BEING DETACHED FROM THE WOOD IN THE ORDINARY MANNER.

Sir Rowland Hill 75 per cent. reverted back to Charles Lefebvre, from which it had originally sported. I do not know where he got his buds, but if he had to bud them next year he would take very good care not to use the buds of any of those bushes which had thus played him false, and hence it is of great importance that when a new Rose is brought out it should be distinctly stated whether it is a seedling or a sport; for if the latter there is no guarantee of its fixedness, and it would have to be carefully watched. If these things be as I have stated, it is quite evident that there is likely to be disappointment somewhere in plants purchased from Rose growers; it is impossible that they can take this care—they have to propagate tens and hundreds of thousands. A budder goes down a row of plants, takes off the buds which seem to him to be ready; he does not stop to examine whether they have flowered or not, and when these plants are distributed, some may get into the hands of those who will feel that through some want of care or bad management of their own their plants do not act as they expected. There are some growers who, I believe, do give orders to their men not to use flowerless shoots; but all who know the virtues of the much-petted British workman are well aware that he will not allow any matter of so small a character to once influence him.

Perhaps some on reading this may say, "What a bother, and how troublesome to have to take so much care about so simple a matter!" Yes, but is there anything to be had without trouble and care? Of course, things may be done in a kind of way without it, but to do any matter well there must be trouble, and whether is it better to do this than to have the

vexation of seeing, when the Rose season comes on, and you are expecting to see fine blooms, that you have many a vacancy, and others with inferior flowers?

We have had in many respects a very doubtful season, but the weather has been favourable, so far, for budding, and with a little care there ought to be no blanks. Cool, very cool, weather, and occasional rains, are all in favour of the budder, as far as his stocks and buds are concerned, while they add materially to his own personal comfort. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

MARICA OCCIDENTALIS, Baker, n. sp.*

THIS new species of Marica resembles *M. Northiana* in colouring, but the flower is not so large, and the leaves are much shorter. It was imported by Linden from Peru, and this is the first time we have had any species of this genus from the west side of the American continent. Like the other species, it needs stove heat. It flowered at Kew for the first time this summer, in July.

Leaves, five, in an erect fan-shaped cluster, ensiform, bright green, the central ones a foot long, above an inch broad at the middle. Stem erect, above a foot long, broadly winged throughout, with a large free leaf below the inflorescence. Clusters of flowers three; spathe cylindrical, an inch long; valves firm, green, lanceolate. Ovary protruded from the spathe, cylindrical, 6-sulcate, one-third of an inch long. Outer segments of the perianth oblong, white, spreading, an inch long; inner half as long, convolute, the concave base mottled with brown, the ovate tip with violet. Anthers linear, white, adpressed to the styles; filaments free. Style-branches white, connivent; crests erect, ovate-lanceolate. *J. G. Baker.*

NEW ORCHIDS.

The second decade of new Orchids described by Mr. Rolfe appears in the May-June number of the *Kew Bulletin*. With one exception, the species are represented in European collections, as will be seen below:—

1. *Pleurothallis subulata*.—A species allied to *P. cardioballis*, Rehb. f., with cordate-oblong leaves and dark lurid-purple flowers, from the collection of Baron Hruby, of Peckau, Bohemia. Its native country is not recorded (p. 137).

2. *Restrepia eouadorensis*.—An Ecuadorean species of the affinity of *R. antennifera*, Kunth, but with shorter lateral sepals and other differences, though with a general resemblance in coloration. It was imported by Messrs. F. Sander & Co., of St. Albans, and flowered in their collection (p. 138).

3. *Restrepia Shuttleworthii*.—A small, brightly-coloured Andine species, sent to Kew for determination by Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, in March, 1891. It is allied to the Guatemalan *R. xanthophthalma*, Rehb. f., but the flowers are more heavily marked with crimson-purple blotches, and other differences. A plant from the same source flowered in the Kew collection in March of the present year (p. 138).

4. *Dendrobium platycaulon*.—A very singular species, allied to *D. lamellatum*, Lindl., but with the flowers twice as large, and a very different lip. The curiously-flattened pseudobulbs bear from three to five leaves near the apex, and racemes of three to six straw-coloured flowers. It is a native of the Philippine Islands, and was introduced by Messrs. F. Sander & Co., of St. Albans (p. 139).

5. *Bubophyllum densiflorum*.—A small species allied to *B. triate*, Rehb. f., but with a longer raceme of yellow, not deep purple, flowers. It is a native

* *Marica occidentalis*, Baker, n. sp.—Acaulis, foliis pedalis ensiformibus nitidis viridibus; caule plano alato apice folio libero praedito; spathe 3 cylindricis, valvis firmis viridibus; pedicellis spathe aequilongis; ovario cylindrico 6-sulcato; perianthii segmentis exterioribus oblongis albis; interioribus multo minoribus convolutis apice maculis violaceis decoratis; styli cristis ovato-lanceolatis.

of the Eastern Himalayas, and was sent to Kew for determination by Mr. Nelson Company, The Gardens, Thedden Grange, Alton, Hants (p. 139).

6. *Eria cristata*.—A pretty little species belonging to the section *Cylindrolobus*, and allied to *E. marginata*, Rolfe. The flowers are white, with some yellow markings on the lip, and a hairy crest at the base of the front lobe, in allusion to which the name is given. It is a native of Moulmein, whence it was sent to Kew by Mr. C. Peché in 1882 (p. 139).

7. *Odontoglossum auriculatum*.—A pretty little species allied to *O. Lindleyanum*, Rehb. f., but differing in its hastately-trilobed lip, the disc of which is light purple instead of brown. It was imported by Messrs. F. Sander & Co., of St. Albans, together with *O. navium*, Lindl. The name is given in allusion to the ear-like side-lobes of the lip (p. 140).

8. *Odontoglossum guttatum*.—An interesting species allied to *O. odoratum*, Lindl., but with fimbriate column-wings, and light-yellow flowers, irregularly blotched with chocolate. Its fimbriate column-wings recall *O. crocidipterum* and *O. praestans*, which are different in other respects. It is a native of Ocaña, whence it was introduced in 1886 as *O. blandum*, Rehb. f. It flowered with G. R. le Doux, Esq., of Langton House, East Molesey, in March, 1892, and a plant has been presented by him to the Kew collection (p. 140).

9. *Vanilla ensifolia*.—A species from the Cauca province of New Granada, characterised by its narrow sword-like leaves. It is described from dried specimens at Kew and in the Herbarium of the Pharmaceutical Society (p. 141).

10. *Spiranthes olivacea*.—A small species with dark olive-green leaves, marked with a few white spots, and light olive-green flowers, tipped with light pink, and a whitish lip. It was introduced from North Peru by Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford. A plant presented by them to Kew flowered in March of the present year (p. 141).

We also observe a new genus of Orchids, described by the same author, from a collection of Solomon Island plants recently made by the Rev. R. B. Comins. It belongs to the *Anæctochilus* group, and has handsome red and green leaves. It is said to be allied to the genus *Macodes*, and is called *Pseudo-macodes Cominsii*.

BOOK NOTICE.

THE SILVA OF NORTH AMERICA, &c.—By Charles Sprague Sargent, vol. iv., Rosaceæ—Saxifragaceæ. (Boston and New York, Houghton, Mifflin & Co.)

The fourth volume of this publication amply maintains the reputation acquired by earlier volumes, as within its limitations the most important work of its kind that has yet been produced. The text comprises full descriptions of the trees of the North American continent, together with bibliographic references, historical notes, discussions on geographical distribution, and indications of their value as timber or fruit trees. The task has fallen into appropriate hands, for no one could be found as competent to deal with this subject as the Director of the Arnold Arboretum of Harvard University and the editor of *Garden and Forest*. As for the illustrations, they fulfil the requirements of botanists, as being faithful representations of the plants as they are, not as the draughtsman thinks they ought to be, and not "artistic" smudges, which leave as much, or more, to the imagination than they convey to the intelligence. The drawings were originally made by Mr. Faxon, and have been engraved under the superintendence of the famous French artist, M. Riocreux, by MM. Philibert and Eugène Picart.

In the present volume many very interesting subjects are passed in review, as may be understood when it is stated that the genera now treated of include *Prunus*, *Pyrus*, *Cratægus*, *Amelanchier*, and other genera of Rosaceæ; *Chrysobalanus Icaco*, which

at first excites surprise at its presence, but its existence in Florida justifies its inclusion in this volume. Professor Sargent's opinion on certain botanical points will be perused with interest; thus, he takes a broad view of the limits of genera, and includes under *Prunus*, as subgenera, *Amygdalus*, *Emplectocladus*, *Armeniaca*, *Prunus proper*, *Cerasus*, *Padus*, and *Laurocerasus*. Similarly with *Pyrus* he groups as sections, *Malus*, *Pyrus proper*, *Aria*, *Aronia*, *Micromeles*, and *Sorbus*. The genus *Cratægus* again is one of special interest to tree cultivators, on which account, and as serving to give an indication of the contents of the book, we may cite the following passages, omitting, however, the bibliographical citations and extracts which our space will not allow us to copy.

"*Cratægus* is widely and generally distributed through the temperate regions of the northern hemisphere. About forty species, nearly equally divided between the Old World and the New, can be distinguished. Fourteen are found within the territory of the United States, a larger number of species occurring in the region between the Red and the Trinity Rivers in Western Louisiana and Eastern Texas than in any other district of similar extent. Three species at least occur in Mexico, and of these one ranges southward to the mountains of Ecuador, the most southern country which any member of the genus is known to reach. In Europe, where *Cratægus* is distributed from Scandinavia to the shores of the Mediterranean, and from the Atlantic to the Black Sea, fourteen species are now generally recognised; in the Orient, six endemic species are known; two occur in the Himalayan regions of Central Asia, and three in China and Japan.

"*Cratægus* has few useful properties. The wood of all the species is heavy, hard, and solid, and is sometimes used for levers, the handles of tools, and other small articles. In the United States, the fruit of some of the species is made into jellies and preserves, and in northern China the fruit of *Cratægus pinnatifida* is employed for the same purpose. The Old World *Cratægus oxyacantha*, the most widely-distributed plant of the genus, is sometimes cultivated in Afghanistan and the north-western Himalayas as a fruit tree, and in some parts of Europe its fruit is fermented and used to strengthen cider and perry. Many of the species are esteemed as ornamental plants, and *Cratægus oxyacantha*, with its numerous varieties developed in cultivation, has been for centuries a favourite park and hedge plant in Europe.

"The American species of *Cratægus* are preyed upon by numerous insects, and are often injured by serious fungal diseases.

"The generic name, from *κρatos*, refers to the strength of the wood produced by the different species."

The species are treated in the same way, so that the book is a veritable encyclopædia. Little or nothing is left for the systematic botanist to do, so that the anatomist and biologist of the future will find their materials ready to their hand, and their course clearly mapped out for them. Needless to say, the planter and the tree-lover will find all available information within the covers of this most notable book.

CORDON OR TRAINED GOOSEBERRIES.

It is only right that those amateurs who may be enamoured of the terms cordon and trained, should know that these methods of growing the Gooseberry and Currant involve some small amount of labour in summer thinning and shortening of the shoots.

By cutting back a one-year old plant, be it Currant or Gooseberry, you get the foundation of the future cordon in three or four shoots that result from the cutting back. These shoots should be allowed to grow unrestrained for one year, and then be slightly topped and fastened to a stake if meant for an upright cordon, or in other ways if intended to grow obliquely or horizontally.

Of course, these shoots will bristle in two years with short laterals for their whole length, and if these are allowed to grow at will, they will make fruit gathering a disagreeable bit of work—in fact, all but impossible without hedgers' gloves, for the hand must be passed through and amongst them to reach the fruits, which hang entirely on the main stems at that age. Hence the need for a summer pruning, at which time the laterals are shortened to half their length, the weakest cut down to a snag half an inch long, or removed entirely, if fruit-spurs are numerous enough, and the leaders of the main shoots laid-in and made secure, and, finally, two or three new shoots taken from near the ground laid-in, to take the place of the old ones that will need renewing piecemeal. It is not necessary to lay in these shoots from the base every year, once in three years being sufficiently often, and it holds good of Currants as well as Gooseberries. Treated in this manner, these small fruits may be planted in lines by the sides of walks, say 1½ feet back from the edging, and 3 feet from plant to plant, or they may be planted in a quarter by themselves, in lines 4 feet or more apart. By having upright cordons on stout stakes sawn off at one height, say 5 feet, and secured neatly with slating laths stretching down the lines, and nailed on to the top of each stake, the whole is kept in precise form, and the netting of the fruit is easily done, but the nets should not be laid on these laths, but on others at wider distances apart, and rising 1 foot above the tops of the plants, any neglect of this causing the nets to get badly torn.

At the winter-pruning, all the laterals that were left at half their length at the early July pruning must be cut back to three-quarters of an inch from the base, long fruiting-spurs—that is, those that are longer than 3 inches—cut away entirely, or shortened, new shoots laid-in, and everything higher than the stakes cut off.

In fastening these upright-growing plants, tarred string or willow shoots should be used for ties, except for the youngest shoots, for which strong bast is best. In oblique or horizontal cordons, if these are grown on a wall, the stems to the number of four may be spread out—say, 1 foot or 9 inches apart, or they may be tied in a bundle round a wire or a wooden rail. For these, the same kind of treatment as regards pruning is required. *Yellow Hornet*.

ORCHID NOTES AND GLEANINGS.

MESSRS. JAMES VEITCH & SON'S *Cattleyas* and *Lælias* are now almost out of bloom; greater prominence seems to be given to the rarer plants. Among these, such is the new hybrid, *Disa Veitchii* (*racemosa* × *grandiflora*), one spike of which was carrying twelve flowers, which are of a rosy-crimson, and of so much beauty that the species bids fair to run the older *D. grandiflora* hard for the first place; and, beside being a very free grower, it is a certain flowerer. Another good plant is *Phalænopsis Artemis* × (*P. amabilis*, Bl. ♀. *P. rosea* ♂), a decided acquisition, with flowers of a delicate pink colour unlike those of any other *Phalænopsis*. Beside it stood the pretty and rare *Cypripedium Aylingii* × (*niveum* × *ciliolare*), whose white purple-spotted flowers resemble those of *C. niveum* in colour, but with more ample sepals and petals. It has much beauty, and is of a class that is likely to be always rare. *Cypripedium Chamberlainianum*, too, a most quaint and beautiful new species, was noted in several examples, each of which, in the rich crimson spotting of the pouch, or in some other particulars, differ from each other, all being very handsome, and none the less desirable because of these differences. Another noteworthy species which, if not new, is still very rare, is the curious, fleshy-leaved *Trichopilia hymenantha*, a plant of which was carrying several pendulous eight-flowered racemes. The flowers are white, speckled with bright reddish-purple on the lip. It is a distinct and desirable species.

Other plants not often met with, but which are now in bloom at Messrs. J. Veitch & Son's nursery,

are *Dendrobium atro-violaceum*, the snow-white *D. aquem*, the rich vinous crimson-coloured *Epidendrum O'Brienianum*, an almost perpetual flowering plant; a giant form of *Oncidium longipes*, which bears six or seven flowers on a spike; an unknown *Lycaste*, with white petals and lip, and the perfume of *Primroses*. There is also a large lot of rare *Cypripediums* in bloom, species and hybrids; some *Cattleya Mendeli*, of fine quality; a fine show of *Oncidium macranthum*; and the East India houses are replete with superbly-cultivated specimens of *Vandas*, *Saccolabiums*, *Aërides*, &c., a few being in flower. The Rockery show-house was gay with the flowers of the Orchids of the season, as usual.

THE CEDARS, BANBURY.

THE CEDARS is the residence of J. Coleman, Esq., an ardent lover of gardening, who has been very successful with the cultivation of the tuberous *Begonia*, and many of the finest varieties sent out by the best raisers are to be found in his collection. Those in flower at the time that I saw the gardens were Dr. Feltz, very fine, bearing large double flowers of deep crimson. B. Mrs. H. Coleman, raised by Mr. Coleman, a very brilliant deep scarlet flower, which, when fully expanded, measures 6 inches in diameter. Golden Queen, a choice double-flowered yellow variety. Professor Henry Smith, another double-flowered yellow of a different form, with flowers 5 inches across when full blown. Among the whites in flower were Her Majesty, of a pearly hue and much substance of petal, a fine flower and a good grower. Albert George, Mrs. H. G. Murray Stewart, Edward's Red Eye, Mrs. Armstrong, Frances F. Fox, and Mrs. G. Price were among the other good varieties noticed. *Begonias* are not the only plants which have done well at The Cedars—Orchids figuring prominently, and they are cultivated equally well with the *Begonias*. Several good *Cattleya Mendelii* and *C. Gaskelliana* were in flower, besides various *Cypripediums* and *Dendrobiums*, and all in fine health and promising to flower well again next season. Considering that this place is quite new, and the proprietor a gentleman deeply interested in plant culture, we may confidently look for fine things at no distant period. J. M.

PHOENIX PARK, DUBLIN.

THIS charmingly-situated royal park covers an area of 1700 acres. It is 6 miles round, contains 16 miles of excellent roads, and a like length of equally good footpaths, the most frequented of these being well lighted with gas-lamps. The park has much to show in beautiful trees and varied scenery. There are majestic Oaks with trunks 3 to 4 feet in diameter, and said to be about 500 years old, and numerous ancient Elm and Beech trees of great size and handsome outline; deep valleys with lakes in the bottoms, and wooded slopes; broad expanses of furze-covered land, level plains, and shady groves, and perhaps finer views of mountain scenery are obtained from here than can be had from any other royal park in Her Majesty's dominions. In May and June the flowers of furze, and of many acres of Hawthorn trees, or, rather, huge bushes, make a grand display of colour, and form a great attraction to the Dublin citizens.

"The Whitethorn-bush with seats beneath the shade,
Was for talking age and whispering lovers made."

There are some thriving woods, consisting of various species of timber trees from sixty years old down to those which were quite recently planted. The soil is a stiff boulder clay on the carboniferous limestone, and any quantity of the finest gravel of all sizes is procurable within the limits of the park from an extinct sea beach and an overlying escarp of gravel.

It may be interesting to mention that the so-called "fifteen acres" used for the manoeuvring of troops is a fine plain of 500 acres. Fifteen hundred head of sheep, and over a thousand fallow deer, said to be the finest under the Crown, are grazed in the park.

The People's Garden is the appropriate name given to that portion of the Phoenix Park which is devoted to flower gardening, and the area is about 16 acres. Within that space of ground a charming variety of scenery is found, scenery to which Nature has contributed liberally, and which the landscape gardener and park bailiff, Mr. William Dick, and his predecessors in the post, have made the most of. We found great breadths of velvety lawn, with large flower-beds, and isolated groups of shrubs, bordered with choice perennials, herbaceous and other plants, and surprises met one on every hand. Here are to be found fine examples of carpet-bedding, of ribbon-borders, and of subtropical gardening. In one part the pedestrian descends some zigzag walks, amidst huge boulders, piled up very naturally, and amongst which numerous alpine, and some fine specimens of *Phormium tenax variegatum*, and *Ilyacinthus candicans* were observed to flourish, and further on are some deep ravines, whose sides are clothed with many kinds of shrubs, climbers, trailers, and through which streams lazily wend their way in the direction of the adjacent Liffey. In this part numerous seats and capital shelters of the Swiss style, open at one side, are provided, and perhaps the best of these is one situate at the top of the expanse of green sward, in the centre of which stands the statue of the Earl of Carlisle, which would afford sitting accommodation for a great number of people. Immediately in front stretches a lawn, with well-filled flower-beds and borders at intervals round the outside, and isolated trees and shrubs, and beyond is the fine range of the Royal Military Hospital buildings that block the view on one side, whilst away (some twelve and seven miles respectively) in front and extending to the right and left, are the Wicklow and Dublin mountains, and a charming landscape in the middle distance.

About 100,000 bedding plants are used for summer bedding, and 150,000 bulbs for spring, besides myriads of Wallflowers, *Aubrietias*, *Doronicums*, *Arabis*, and many others. The bulbs used are largely of Mr. Dick's propagation. Subtropical plants and carpet-borders were in fine condition at the time of my visit, the moist climate being very congenial to their requirements. Tuberous-rooted *Begonias* made a grand display, and Mr. Dick considers them, as many others do, as being infinitely better than *Pelargoniums* for bedding purposes. *Violas* are largely employed, especially for forming the groundwork for various standards and pyramidally-trained plants.

Beds arranged as follows were very telling in effect, especially when viewed in connection with the several examples of carpet-bedding patterns, good in design, arrangement of colours, and keep, namely, Flower of the Day (variegated) *Pelargoniums*, intermixed and edged with blue *Violas* with "dot" plants of *Abutilon Thomsaonii*, the pale green leaves of the latter, marbled with gold, showing to great advantage above the ground of light and blue. Golden Harry Hoover, and standards of *Acacia lophantha* planted in a groundwork of, and edged with, Blue Perfection *Viola*, made a pretty bed. A long bed having *Calceolaria amplexicaulis* in the centre, then a good band of Mrs. Gibson (scarlet) *Pelargoniums*, edged with *Sedum Lydium*, produced a quiet though pleasing effect; the same may be said of a similarly-shaped bed, having a centre of single-flowered *Petunia*, with a band a yard wide of Mrs. Turner (pink) *Pelargoniums*, and edged with the large silvery-leaved Duke of Edinburgh Ivy-leaf *Geraniums*, pegged into position. Beds having *Cannas* in the centre, and surrounded by *Begonias* and standards of *Acacia lophantha*, with stems 2 inches in diameter, and *Echeveria metallica*, 18 inches high, round the outside, contrasted well with the other arrangements, as also did four dozen standard plants of *Ficus elastica*, together with several similarly-grown plants of *Heliotrope* and silver-leaved *Pelargoniums*, set in a ground of Harrison's Musk, with *Alternantheras* and *Pyrethrum laciniatus*, forming panels at the sides and ends of the large square bed thus arranged.

Contrasting with these were circular beds having centres of Helen Linsey (pink), with broad

bands of Mrs. Mappin (variegated) *Pelargoniums*, with a judicious intermixture of young plants of *Acacia lophantha* from 2 to 3 feet high, the whole being edged with a good band of blue *Lobelia*, *Dracenas*, *Ricinus Gibsoni*, and *Fuchsias*, planted on a groundwork of Harrison's Musk, with bands of *Iresine Lindenii* (dark), *Pyrethrum* (Golden Feather), and *Alternanthera paronychioides major*, edged with *Echeveria secunda glauca*, made a fine contrast to the arrangement just described. A circular bed, about 20 feet in diameter, had a telling effect planted as follows:—A good-sized plant of *Kentia australis* occupied the centre, surrounded by *Agave americana* fol. aur. var., *Yucca alifolia variegatum*, as well as the green-leaved variety, *Dracenas*, *Echeverias tabuliformis* and *metallica*, these being planted on a carpeting of silvery *Sedum*, and around which were bands of *Alternanthera paronychioides major*, *A. lutea*, golden *Arabis*, with "dot" plants of *Echeveria metallica* and *Pachyphytum bracteosum* in the line dividing the *Arabis*, and a band a foot wide of the blue-foliaged *Kleinia*, the whole being edged with *Echeveria secunda glauca*.

It may be interesting to mention that the People's Garden is within 400 yards of Sackville Street, the principal street in Dublin, and perhaps one of the finest of its kind in the world, and that the park has eight entrance gates and lodges, that it is more than four times the size of Regent's Park, London, and nearly five times as large as Hyde Park. The park contains the Vice-regal Lodge, the Chief Secretary and Under-Secretary's lodges respectively, the Royal Zoological Gardens, wherein are said to be the finest lions in Europe, the Ordnance Survey Barracks, the Royal Iberian Military School, and the *dépôt* of the Royal Irish Constabulary. In conclusion, I may be permitted to say that the practical manner in which all the details and good keep of the gardens and park are carried out, reflect great credit on Mr. William Dick. *Tourist*.

IRIS LORTETI (BARBEY).*

THIS most beautiful *Iris*, belonging to the *Oncocyclus* section, was discovered some years ago between Meis and Hounin in South Lebanon, by Dr. Lortet, the accomplished naturalist of Lyons. It was described by Barbey, *Herborisations au Levant*, p. 178, 1882, who there gives a large coloured figure of it. Thanks to the unwearied zeal of Mr. Max Leichtlin, a considerable stock of roots has recently been imported from Palestine, and is now in the hands of Mr. V. Tubergheim, of Haarlem, who supplied the flower represented in the accompanying figure.

The *Oncocyclus* group of *Irises* is best known through *Iris Susiana*, which has been in cultivation in western Europe for more than two hundred years, and is still more widely grown than any other member of the group. *Iris Susiana* has its home in western Persia, and stretching away towards the Caucasus lives the next best known, *Iris iberica*. This part of the world may indeed be regarded as the centre of the group, and as we pass westward along the southern regions of Asia Minor, we find several forms, more or less closely allied to *I. Susiana*, all of them beautiful. Near Mardin grows the lovely *I. Gatesii*, not far off the striking *I. Heylandiana*, more to the west in Cilicia the handsome *I. Saari*, and in Palestine is found an *Iris* which, sent to me from the neighbourhood of Nazareth, through the kindness of Miss Lee, of the Mission School, I exhibited at the Royal Horticultural Society some two or three years ago under the provisional name of *I. Saari* var. *Nazarena*.

I have not yet described this latter *Iris*, because I have so far failed to flower it again in a manner sufficiently satisfactory for description; but I am inclined now to think that it deserves a specific name, and should be called *I. Nazarena*. It must be admitted, however, that the structural differences between it and *I. Saari*, as, indeed, those between *I. Sari* with *I. Heylandiana* and *I. Susiana*, are not

* *Iris Lorteti*, Barbey, in Boissier, *Flor. Orient.*, v., p. 131; *Herbar Levant*, t. 7. Baker in *Bot. Mag.*, t. 7261, August, 1892.

very marked, though on account of differences in colour the several plants are, for garden purposes, very distinct.

Iris Lorteti in general features comes very close to *I. Snari*, and especially, perhaps, to my *I. Nazarena*, but its wonderful colouring puts it by itself as, perhaps, the most beautiful *Iris* in the world. In the specimens gathered by Lortet, the outer segments are described and figured as showing a very pale blue ground covered with crimson spots,

I learn that the plants imported by Mr. Max Leichtlin show considerable variation in colour; apparently, however, the "note" of the plant is a peculiarly charming combination of crimson spots, and blue or violet veins, on a white or creamy-yellow ground.

The flower figured by Barbey is as large as that of an ordinary, or rather smaller *I. Susiana*; the one figured now is distinctly smaller, but it was sent from Holland in bud, and probably did not acquire

Barbey describes the leaves as being very narrow, though his figure somewhat contradicts this, and in the plants grown by me the leaves are very distinctly broader and more ample than in *I. Susiana*; indeed it appears to me to promise a larger foliage than is possessed by any other *Oncocyclus Iris*.

As regards cultivation, I have come to the conclusion that all these Palestine *Oncocyclus Irises* should be treated in this country by the "taking-up" method—at least, until they have become acclimatised, if ever they do. But one or two points appear to be essential for success by this method. In the first place they should be planted quite late—say in October, or even November, according to climate; this prevents their making any growth of leaves before winter comes on. In the second place they must be protected during winter and early spring, so that the young shoots receive no injury from frost. As soon as the foliage, after flowering, begins to die down, they should be taken up, well ripened in a sunny greenhouse, and kept absolutely dry until it is time to plant them again. The object of this treatment is to secure their not making any very active growth until fairly warm weather sets in, so that when they are hardest at work they may be comforted by genial sunshine, and not buffeted by autumn rains and winter frost as they are when they are left in the ground or planted in early autumn. *M. Foster, Shelford, July 30.*

[A coloured figure of *Iris Lorteti* is, by a coincidence, given in this month's *Botanical Magazine*, t. 7251, from a plant that flowered in the garden of Captain Elwes. There the sepals, or falls, are shown as having a pale yellowish ground, thickly beset with minute purplish dots and streaks radiating from a large purple blotch which forms the sign post for the insect visitors in their quest of the nectar, and in their consequent pollen-distributing function. The petals, or falls, are of a light violet colour. Ed.]

FIG. 27.—IRIS LORTETI.

which, scattered sparsely over the marginal parts of the fall, are concentrated into a dark crimson patch or "signal" in the centre beneath the end of the style; the inner segments or standards are similarly described as being of a delicate pale rose. In a plant flowered by myself this summer, the falls showed a creamy-yellow ground marked with crimson spots, concentrated at the centre into a dark crimson signal, while the standards were nearly pure white, marked with very thin violet veins hardly visible at a distance.

its full size. I imagine that, when well grown, the flower will be found to be about as large, but on the whole rather smaller than that of a well-grown *I. Susiana*.

It is perhaps hardly necessary to add that the flower has the characteristic features of its allies; an oval fall convex from side to side as well as reflexed vertically, bearing a loose beard of scattered hairs, an orbicular, erect standard, and a nearly horizontal style lying close on the claw of the fall, and bearing conspicuous semicircular crests.

REMARKS ON THE FRUIT CROPS OF 1892.

[For Tabulated Summary, see p. 93.]

(Continued from p. 136.)

4. ENGLAND, MIDLAND.

BUCKS.—The Apple and Pear crops are very thin ones in this neighbourhood. Plums, except on walls, which are fairly good, are a short crop, the repeated late frosts and cutting east winds having played havoc among standards in exposed situations. Strawberries were extra good both in quantity and the quality of the fruit, especially President and Laxton's Noble. Gooseberries are much troubled with caterpillars. *C. Turner, Cranfield Court.*

— Although all kinds of fruit trees were late in blooming, much damage was done by spring frosts. Apricots had set an excellent crop, and the fruit was swelling fast when the frost came and destroyed more than half the crop, even under double nets. All kinds of fruit trees are remarkably healthy this season, and hardly any insects have been seen, and no blight of any kind. *J. Smith, Mentmore, Leighton Buzzard.*

— Speaking generally, the fruit crops in this district are good. Apple trees are heavily laden with fruit (in some instances too heavily), and, with the recent rains, are swelling fast, and promise to be an excellent crop. Pears are a failure, excepting a few trees against a wall facing the east. Here Williams' Bon Chrétien, Pitmaston Duchess, and Seckle are bearing fairly well. Plums generally are very thin, some trees on walls, including Victoria and Early Prolific, are carrying a fair crop; standard trees are very thinly fruited. Apricots are a failure, but Peaches and Nectarines are abundant, many fruits having to be removed from the majority of the trees; the latter are healthy, and have not been much infested with aphid this year. Bush fruits are abundant and good. Strawberries were rather smaller than usual, and will be over sooner, owing to the dry weather earlier in the season. From autumn-planted runners we began gathering a good

supply on June 7, the varieties being Noble and Vicomtesse II. de Thury. The first fruit was ripe on June 3. Filberts and Cob Nuts are plentiful. *Chas. Herrin, Dropmore, Maidenhead.*

BUCKS.—The crops of Apples, Cherries, Peaches and Nectarines, Currants, Raspberries, Strawberries, Nuts, and Walnuts are very good indeed. The crops of most kinds of Plums are very short, excepting Greengages and Damsons, which are a little better. Amongst new varieties of the Strawberry we have two that are excellent, viz., Laxton's Royal Sovereign, which partakes of the Queen type, and Gunton Park, a large Cockscomb-shaped, dark-coloured fruit, of excellent quality. *G. T. Miles Wycombe Abbey.*

— Apples were well furnished with bloom-buds, but in consequence of the very backward season, and the continuance of frost every night, the blooms opened badly, and the set was very light, especially on pyramidal trees; espalier trees are carrying quite double the quantity of fruit. Lane's Prince Albert surpasses all other varieties as a pyramid. On espalier trees of Alfriston, Ashmead's Kernel, Irish Peach, Cox's Orange Pippin, Cockle Pippin, Golden Harvey, Gravenstein, King of Pippins, Lord Grosvenor, Lord Suffield, and Margil are the best. Pears and Plums on pyramidal trees are practically failures; on walls and espaliers under average, but of fair quality. Gooseberries very light crop; Raspberries and Currants fair. *J. Jacques, Waddesdon Gardens, Aylesbury.*

CHEESHIRE.—The fruit crops are this season the worst that we have had for several years, no doubt owing to the very hard spring frosts we experienced hereabouts, and to the severe attack of the Gooseberry sawfly-caterpillar afterwards, which quite crippled the growth of the bushes. The loss of the Gooseberry crop will be severely felt by our market cultivators. *Jno. V. Smith, Arley Hall, Northwich.*

— Fruit trees generally did not flower very plentifully last spring, owing, as I believe, to the cold and unfavourable character of last season; and this, with the low temperature during a great portion of April and May, caused the flowers to fall without setting, and there is, in consequence, very little or no fruit on many trees. A few varieties of Apples and Pears have an average crop, but the greater portion have few or none. Strawberries have ripened very slowly. Gooseberries less than I have known for many years. Aphides and caterpillars were in great numbers, particularly the latter, on the Oak trees, but great numbers have been destroyed by rooks, which are now devouring the moths. *Wm. Whittaker, Crewe Hall.*

DERBYSHIRE.—The fruit crop hereabouts is perhaps the poorest for very many years. Several kinds are almost a total failure, such as Apricots, Pears, and Plums. I may attribute the cause to the unusual fluctuations of temperature, for on April 5 the temperature was 71° in the shade, and on the 18th we had 12° of frost. The temperature for April was the highest average for fifteen years. The rainfall was the lowest average for ten years. Some of the very early blooming Apples are a good crop, also some of the very late-blooming kinds are satisfactory. *J. H. Goodacre, Elvaston Gardens, Derby.*

HERTFORDSHIRE.—Apples are again this year slightly under average, but the fruits are very clean and healthy, such varieties as Cellini Pippin, Kerry Pippin, Cox's Orange Pippin, Hawthornden, and Blenheim Pippin, carrying heavy crops. Small fruits, with the exception of Strawberries, are very fine this season. The Strawberry plants suffered very much from the long continuation of wet and cold during the past winter, and in many places one-third of the plants were killed outright. *Joseph Fitt, The Gardens, Paushanger.*

— Apples and Pears in this district are a poor crop, although the prospect was at one time good—the trees had abundance of blossom, but it did not set. Bush fruits of all kinds are plentiful; Raspberries and Strawberries are good. Red and black Currants are carrying remarkable crops; also Peaches and Nectarines. Apricots are a good

average crop; Filberts are an immense crop. *C. E. Martin, The Hoo Gardens, Welwyn.*

HERTFORDSHIRE.—The bloom on all our fruit trees, except Pears, was plentiful, a fact that may be due to the heavy crops of 1891 restricting and checking exuberant growth of shoots. Plums were very promising when in bloom, but the frosts destroyed the open bloom to such an extent that the crop is almost a failure. The same causes reduced the crops of red and white Currants to about one-quarter of a crop, but black Currants did not suffer. Peaches set well, and the trees are carrying a very heavy crop. As regards Cherries, I never saw finer in this county. Apple trees are clean and free from caterpillars. Wellington Apple promises to be very fine this year. Of late-introduced kinds Lady Henniiker promises to be one of the best, and succeeds in this garden; it is a good grower and bearer, with large, handsome, and good flavoured fruits. *George Norman, Hatfield House Gardens.*

NOTTINGHAMSHIRE.—In the early season as each came in bloom, viz., Apples, Pears, Plums, and Cherries, all gave promise of the quantity of bloom for an abundant crop, but when in flower came a time of cold east wind, very dry and cutting, with very little sun, and frost from April 1 to the 19th; we had only two nights in which there was not frost. On April 1, 11° of frost, and on the 19th, 12°. This long time when most in bloom, killed almost everything; the trees for a long time made no growth, all seemed paralysed. We have a few Apples on Duchess of Oldenburgh, Lord Suffield, and Blenheim Orange, but very few on others. Pears are very scarce, Emile de Heyst, Louise Bonne of Jersey, Beurré Diel, Catillac, Easter Beurré, are the best that we have. The dessert Plums are very scarce; Damsons only a few. *A. Henderson, Thoresby, Allerton.*

OXFORDSHIRE.—The Apple crop is good, with few exceptions. Pears on walls fairly good, but thin on open trees. Plums good, excepting on some wall trees that were overcropped last year. Cherries good; Morellos, which were very promising, went off suddenly, I think at stoning time, leaving a rather thin crop. Peaches and Nectarines, best crop for some years. I gathered Waterloo on an open wall on the 17th June; Amsden's June and Alexander would be ripe ten days after. Apricots poor. Small fruits plentiful, except Raspberries, which are poor. Strawberries fairly good, President being the best cropper. Nuts plentiful; Walnuts thin. Fruit trees very free from blight, blister, &c. *George Stanton, Park Place Gardens, Henley-on-Thames.*

RUTLAND.—Apples flowered well, but a large number of the blossoms were killed by frost before they expanded, and those trees which are bearing are chiefly the trees that had very small crops last season. Pears had very little blossom, and much of that was destroyed by frost, so that we shall have scarcely any this season. Plums also showed very little flower, partly owing to the heavy crops they bore last year. Bush fruits of all kinds are heavy crops, and good. Strawberries were finer and more abundant than we have had for several years. Peaches and Nectarines are not cultivated to any extent outside in this county; what few we have, suffered much from the late severe winter. *W. H. Divers, Ketton Hall Gardens, Ketton.*

SHROPSHIRE.—Peaches and Nectarines a full crop. Apricots bloomed well, but suffered, like Plums, from frosts. Apples failed to set, which I must attribute to the growth being immature, with the exception of a few "all-round" varieties, such as King of the Pippins, Keswick Codlin, Tower of Glamis, Hawthornden, &c. Little or no bloom on most kinds of Pears. *A. S. Kemp, Broadway, Shifnal.*

— Early prospects were all that could be desired until the withering north-east winds swept over the district, carrying devastation with it, and causing the trees to look as if they had been scorched. Many acres of Strawberries were ruined by a peculiar kind of blight which was hitherto unknown hereabouts. *Neil Sinclair, Park Hall Gardens, Oswestry.*

WARWICKSHIRE.—In parts around here the Apple

crop is a pretty good one, but Blenheim Orange, Northern Greenings, and Ribston Pippins are very thinly set. Peaches and Nectarines are very heavily cropped, and the foliage clean and healthy. *J. Rodger, Gardens, Charlecote Park.*

5. SOUTHERN COUNTIES.

BERKSHIRE.—There was every prospect of a good fruit season, plenty of bloom, and a good set; but the frost on May 6 and 7 thinned all crops, and nearly destroyed the Pears, which fell abundantly; 8° was lowest reading here, but 12° was registered in the district. Apples, under average, but some varieties have heavy crops; especially Jolly Beggar, Max Codlin, Lord Grosvenor, Lemon Pippin, and others. Pears, very thin on walls; and standards much under average. Same remarks apply to Plums. Cherries extraordinary crop, trees clean, and fruit fine quality. Knight's Early Black, Bigarreau Napoleon and May Duke, Black Eagle and Tartarian, very fine. Apricots, fair crop. Strawberries plentiful, but small. Noble a heavy crop, and better flavour, probably owing to drought. Waterloo is fine on this soil, also Sir J. Paxton. *O. Thomas, Royal Gardens, Windsor.*

— Our fruit crop here and round about is a very moderate one. Apples promised well when in blooms but were in places much destroyed by the severe frosts. For the last twenty-two years I never saw the Pear crop so bad on walls and standards. Plums the same. Our best crops in the open are Peaches and Nectarines, both clean and good. Bush fruits are moderate. Strawberries suffered from the great heat and want of rain; altogether a most trying season. *James Tegg, Bearwood, Wokingham.*

— Taking the fruit crop all round in this district, it is the worst we have had for many years. Everything looked promising up to June 14, when we had 4° of frost. Plums and Apples had the appearance of having passed through a fire, and dropped abundantly. *J. H. Rose, Lockinge Gardens, Wantage.*

HAMPSHIRE.—Apples are an exceptionally heavy crop, the trees perfectly healthy, and free from insect pest of any kind. Varieties which have been classed as failures for many years—for instance, Ribston Pippin, Blenheim Orange, Devonshire Quarrenden, Wormsley Pippin, New Hawthornden, and Golden Pippin—are now heavily laden with fruit. The varieties Warner's King, Ecklinville, Mère de Ménage, Lord Grosvenor, Beauty of Hants, Cox's Orange Pippin, Worcester Pearmain, Irish Peach, King of the Pippins, Lady Henniiker, and Stirling Castle, which we annually look upon as sure croppers, are this year no exception to that rule. *E. Molyneux, Swanmore Park, Bishops Waltham.*

— Fruit crops in this district are quite up to the average, with the exception of Plums and Pears. Apples were never more beautiful than at the last blooming season; and although at one time it was feared the frost had destroyed the crop, the trees of all varieties are bearing well. Peaches, Nectarines, and Apricots have had to be heavily thinned and kept moving with copious supplies of water. Pears are very scarce, and were it not for a south wall of cordons, a total failure would have to be recorded. Cherries plentiful and good. *A. Maxim, Beckfield Place Gardens, Winchfield.*

KENT.—The Apple crop in this neighbourhood promises to be good; trees and fruit very clean. Pears and Plums are a failure. Cherries very good on standards and walls. Peaches and Nectarines are exceptionally good. Black and Red Currants clean and bright. Raspberries and Strawberries good, but the latter were much damaged by the heavy storm of the 28th June. Auguste Nicaise the best here. *F. Moore, The Gardens, Blendon Hall, Bearey.*

— Crops generally short. Apples not plentiful, but the trees healthy, and not damaged by the caterpillar, which destroyed the foliage so much in recent years. Gooseberries, in many places in this district, were so much injured by late frosts as to have but a very light crop indeed. Raspberry canes of the least bardy kinds cut down by the severe winter, and crop consequently very light. Cherries (on walls small, on account of want of moisture and low tem-

perature. Peach trees very healthy, but bearing scanty crop. Pears the same. Red and white Currants fair as regards crop. Black Currants cropping fairly. Taken as a whole, the fruit crop is unsatisfactory. It may be added that the Strawberry crop felt very much the want of rain at the time when needed for the swelling of the fruit. *G. A. Don, Bedebury Park, Hawkhurst.*

KENT.—Apples are an average crop, and the trees have kept cleaner this season. Pears very thin, but likely to be of good quality. Peaches and Nectarines are very good on open walls. Small fruits only average all over. Gooseberries very thin, and Strawberries also lighter crop, but much better quality than last season. *W. Craik, Hothfield, Ashford.*

MIDDLESEX.—Peaches are a good crop. At the time the trees were in flower we had quite a week of mild weather, but rather windy; these conditions

requires to be much thinned. *Geo. Wythes, Syon House, Brentford, W.*

MIDDLESEX.—The fruit crops are not so heavy as last year. Apples look clean and well. Pears were quite killed after they were set with the late frost. Small fruits suffered in the same way. Plums are a nice crop. Strawberries are only a half crop in this district. *J. W. Bates, Cross Deep, Twickenham.*

SURREY.—I presume an examination of the fruit crops in most places for the present year will show a good one. Here, at our elevation, perhaps, we do not suffer from late spring frosts so much as in the low districts. I consider we have the best crop of Apples we have had for many years. Plums are a heavy one; Pears an average, all clean, and promise to be good samples. Gooseberries, Currants, and Strawberries are abundant and fine; Currants and Gooseberries I have never had better. It is worthy of note

very thin. Filberts and Walnuts a moderate crop. *F. Rutland, Goodwood.*

SUSSEX.—Apples on orchard trees are quite a failure. Pears on walls not half a crop, elsewhere there is none. Plums on walls and pyramids in enclosed garden a failure, standards in open orchard carrying about half a crop. Peaches set very thickly, but the fruits were afterwards thinned by frost, still there is a heavy crop left. *F. Gesson, Cowdray Park, Midhurst.*

— Apples here are a heavy crop. The following are bearing best on standards:—Cox's Orange, Ribston, Kerry, Blenheim Orange and King of Pippins, Warner's King, Wellington, Devonshire Quarrenden, Lord Sutfield, Irish Peach, Mère de Ménage, Keswick Codlin, Northern Dumpling, Non-such, D. T. Fish, Hambleton Deux Ana, Mr. Gladstone. On espaliers Worcester Pearmain, Margil, Cox's Pippin, and Scarlet Nonpareil. On cordons Lord Sutfield, New Hawthornden, Frogmore Prolific. *E. Burberry, Castle Gardens, Arundel.*

WILTSHIRE.—In spite of the very unseasonable character of the weather which prevailed during the period fruit trees were in flower, and indeed up to the third week in June, the fruit crop for 1892, excepting Pears and Plums, will compare favourably with that of previous years, but Pears and Plums, taken on the whole, are almost complete failures. Of Pears, Williams' Bon Chrétien, Marie Louise, Beurré Gris, Ne Plus Meuris, and Doyenné du Comice, trained against west and south-west walls, are bearing light crops. Of Plums, Reine Claude de Bavay, Green Gage, Early Favourite, Guthrie's Green Gage, Coe's Golden Drop, The Czar, and Ickworth Imperatrice are lightly cropped. Apricots under glass-coping are good. Peaches and Nectarines, where protected by canvas when in flower, are heavy crops; the fruit having had to be severely thinned. Apples are an average crop; many of the trees in our orchard are bearing immense crops in the middle, while the outside trees have scarcely any fruit on them. Young trees, both standards and espaliers, in the kitchen garden of Blenheim Orange, Annie Elizabeth, Red Quarrenden, Red Astrachan, Emperor Alexander, and King of the Pippins, are well cropped. Gooseberries and Currants are immense crops. *H. W. Ward, Longford Castle, Salisbury.*

(To be continued.)

FIG. 28.—CYRTANTHUS TUCKII: FLOWERS ORANGE-SCARLET.
Drawn by Mr. J. Weathers.

CYRTANTHUS TUCKII (BAKER).

ALTHOUGH this distinct-looking Amaryllid has been in cultivation some few years, it is still practically unknown outside of botanic gardens. It was originally described by Mr. Baker, of Kew, in the *Journal of Botany*, 1876, p. 183, from specimens sent by Prof. MacOwan, at whose request the plant was named after Mr. William Tuck, of Grahams-town, South Africa.

Cyrtanthus Tuckii is a native of Cape Colony, and has been found growing at an altitude of 4000 to 5000 feet on the Boschberg mountains, and at somewhat lower elevations in Kaifrarria. Mr. F. W. Moore, of Glasnevin, appears to be one of the first to have grown the plant in Europe, as Mr. Baker in his *Handbook of Amaryllideæ* remarks having received a living specimen from that gentleman in 1884.

At a recent meeting of the Royal Horticultural Society in the Drill Hall, Westminster, a plant in bloom was exhibited by Mr. J. O'Brien, who is remarkable for his success in obtaining and flowering all kinds of rare Cape plants. *C. Tuckii* is an important addition to the other species of *Cyrtanthus* at present grown, and, as will be seen by the accompanying sketch, its flowers are by no means small. They are of a bright orange-scarlet, and have the filiform pistil more or less protruding from the tube of the perianth. The bulbs are ovoid, and are furnished with two linear glaucous-green leaves, 12 to 18 inches long, which appear at the same time as the fleshy glaucous-green peduncle, at the summit of which the flowers are arranged in a loose umbel, subtended by two lanceolate greenish spathe-valves. Under cultivation, *C. Tuckii* should

were favourable to their setting, and they held on well. Apples were late in flowering, and so escaped the late frosts and set well. Pears.—During the time these were in flower it was nothing else but frost, night after night, and consequently very few set. Gooseberries, Currants, and Raspberries are abundant, clean, fine and good. Strawberries.—Fruit good, but smaller than last year. *A. J. Ball-hatchet, The Gardens, Fulham Palace, London, S.W.*

— The fruit trees early in the season gave great promise of heavy crops, but the severe weather when in bloom destroyed much of the bloom. Apples such as Manx Codlin, Keswick ditto, Grenadier, and Lord Grosvenor varieties bear a heavy crop. Late and dessert varieties are scarcer. Pears, especially the early varieties, are a worse crop; Louise Bonne de Jersey is the best of these. Plums are a failure. Morello Cherries dropped badly, but the trees will finish a fair crop. The Apricot crop

that Plums were such an exceptionally heavy crop in 1891, and are equal to it in 1892. All that we want now is hot weather, to bring out the fine qualities of the best varieties of Pears and Apples. *A. Evans, Lythe Hill, Haslemere.*

SUSSEX.—Pears and Plums all bloomed abundantly, and set well, but the severe frosts completely killed all the fruit on the bush trees. I never remember to have seen Raspberry canes so much injured. *Geo. Goldsmith, Leonardslee, Horsham.*

— The long cold spring has not been favourable for the fruit crop, but we have abundance of Apples. The two severe winters have punished the Fig trees terribly, so that there are but very few fruits on the trees, and lots of the young wood killed. *Joseph Rust, Eridge Castle Gardens.*

— Apple and Pear crops excellent, also all bush fruits. Raspberries very good. Plums and Apricots very thin indeed, owing to the spring frost. Figs

soon become a valuable and decorative greenhouse plant, and Mr. O'Brien may possibly be willing to give some information regarding its cultivation, for the benefit of those who already may have plants in their collection. *John Weathers.*

CYPRESSES IN TROPICAL AFRICA.

In the last number of the *Kew Bulletin* is a very interesting account of the botany of the Milanji Mountains to the south of Lake Nyassa. These mountains have recently been visited by Mr. Alexander Whyte, who gives the following account of the vegetation, which is enough to make the mouth of a botanist water. The elevation of the plateau is noted as 6000 feet. The "Cypress" is probably referable to the genus *Widdringtonia*, of which we have already seen scraps from Mozambique. [M. T. M.]

"The flora of the mountain proved to be most interesting the species met with being mostly distinct from those of the plain or even the lower slopes. But under this heading, I must first attempt to give a short description of the Cypresses, the most striking botanical feature of the plateau. The remnant left of these fine Conifers is confined to a few of the upper ravines and valleys, the largest forest of them finding a comparatively secure habitat in the damp gorges of the Lutsheny valley. A few old scorched monarchs of the glen lead a precarious existence pretty well up the southern slopes of the main mountain, but unless steps are taken to protect them [steps have been taken. H. H. J.] these interesting relics of the past are doomed to speedy destruction. It is deplorable to witness the devastating effects of the annual bush fires, from which even this lofty and all but inaccessible retreat is not exempt. During the dry months of August and September these fires, originating from the villages on the lower slopes of the mountain, gradually creep up the precipitous cliffs, from tuft to tuft of grass, until, at last, they reach the glassy plateau. Once there the work of destruction is rapid. The fire rages over the table-land, and eats its way along the edges of the remaining belts of forest, thus annually scorching, if not burning, the bark and timber of the outside trees, and killing outright the young seedlings. In exceptionally dry seasons, it appears that these fires have even penetrated some of the damp forests and hundreds of damp Cypresses lay prostrate and piled on each other, in all stages of destruction, but generally consumed right through at the base of the tree. I measured several of these dead Conifers, and one (by no means the largest to be met with) was 140 feet in length and 5½ feet diameter at 6 feet from its base, and with a clear straight stem of 90 feet in length. The cones of this species of Cypress (which may be new to science) are somewhat smaller than a chestnut, of the same shape, i.e., longer than broad, and open into four scales or segments, each having a spur-like knob at its apex, and covering five or six winged seeds. The foliage is of the usual Juniper-like description, and the timber is of a dull reddish-white colour, of excellent quality, and easily worked. The bark on old trees is of great thickness, consisting of layers annually shed and renewed. I selected sections of this valuable timber tree, which I hope to send home with the other Milanji specimens by an early date. Seeds of it are put in nursery beds in the Residency experimental gardens at Zomba, and I trust the tree will thrive in its new habitat here. One or two other species of Cypresses are met with, but of dwarf and scrubby growth.

"Tree-Ferns attain to a great size in the damp shady forests of the plateau, and one I measured was 30 feet in height, and 2 feet in diameter at the base. I hope to send home sections of them also.

"Never before have I met with more gorgeous displays of wild flowers than those to be seen in some favoured nooks of these highlands. There we observed creamy-white and yellow *Helichrysums*, mingling with purple and blue *Orchids* and *Irises*, and graceful snow-white *Anemones*, all blooming in

wild profusion, and rearing their heads from a bed of bright green grassy sward—a floral carpet, which Nature alone can fashion. Altogether, we procured several thousand specimens of dried plants of many species, and which, I trust, will be of benefit to science. Many of the trees had not come into flower, and the Ferns had not matured their fronds and seeds. The grass-lands also had been too recently burned to permit of many of the plants reaching the flowering-stage."

THE ROSERY.

ROSES IN POTS.

It may not be out of place to give a few more notes upon the above subject, as the present is a most important period of their existence. If pot Roses are to be successfully grown and bloomed next winter and spring, they must have proper attention during this and the two coming months. My latest batch will be placed out upon a sunny border as soon as convenient now. Unless the wood is well-matured, good results cannot accrue. We often complain of having had a bad autumn for ripening the wood of plants growing in the open air, with the result that winter affects the wood more injuriously than would otherwise be the case, yet we are apt to leave the efficient ripening of pot-grown plants too much to chance. It stands to reason that it is even more necessary to secure well-ripened growth upon plants that are to be forced against Nature and in the dead of winter, and this must be taken in hand at once.

All plants require a certain season of rest, and unless you can secure this for them, they will not respond satisfactorily to winter and early spring forcing. This remark refers especially to pot-roses, and should be borne in mind generally.

If you secure well-ripened wood, and allow this a short period of rest before beginning to force, and above all, force very gradually at first, you will be rewarded with greater success than is possible by any other treatment.

Now, in order to follow upon these lines, we must get the wood ripened at this season, or there will be no period of rest for the plants that are to be forced early. All pot-plants should be stood in a sunny position out-of-doors, and care taken that the roots do not suffer from drought during the first few days after removal to the open air. This is important, as the soil will dry up quickly upon being exposed to the air, and what was quite moist while in the damper atmosphere of the Rose-house, will be too dry in an hour or two after being placed in the full sun. Such a state of things would cripple the plants by injuring the young roots, and is a fruitful cause of premature undue ripening. This is the reason why half plunging the pots, so as to keep the roots in a cooler and more uniform state of moisture, is an advisable proceeding; and to cover the side of the outside rows of pots that face the south, otherwise the roots—that are always thicker at the bottoms and sides of the pots—will be parched by heat and drought; the inside rows of plants are sufficiently protected by one another. The real object of this is to afford them as nearly an autumn treatment as possible, by keeping them rather dry at the roots, and affording them full exposure to day and night air.

In October, a few of the best matured may be pruned, and stood in a pit or frame, keeping them close until growth has well commenced, when more water may be afforded, and the plants be removed to a house with a temperature of 60° to 65°; these will then flower about Christmas, and a little later. All of the pot Roses should be under slight cover, of some sort, before the end of November. By pruning and bringing them on as described in three or four batches, a good successional display of cut Roses may be had until the earlier varieties are again in flower upon warm walls and in sheltered positions out-of-doors. After the many articles upon this subject in the pages of the *Gardeners' Chronicle*, it should scarcely be necessary to call attention to the

great necessity of thorough drainage being secured, and for water being carefully and judiciously afforded.

When well into growth, and not sooner, a little weak liquid-manure may be given to great advantage; but never give the Roses manure-water with the object of starting them into growth, as it does not have the desired effect, but retards it by rendering the soil sour, which would not be the case if the roots were actively at work and able to assimilate food. A. P.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By H. A. BURBERRY, *Orchid Grower, Highbury, Birmingham.*

THE EAST INDIA HOUSE.—Every encouragement must be afforded the plants in this division to make strong pseudobulbs or leaves, as the case may be, while summer is still with us; and one way of effecting this is by putting tan, leaf-soil, or seaweed beneath the stages, and forking it over two or three times a week. Some of the species of *Cypripedium*, *Saccolabium*, *Aërides*, *Phalaenopsis*, *Calanthe*, *Angraecum*, and others, also *Oncidium Lanceanum*, *O. Papilio*, *O. ampliatum majus*, *O. Jonesianum* (the last-named being suspended close to the glass in the lightest part), and *Vanda teres* and *V. Hookeriana*, which should have full sunshine, grow best in this house. *Oncidium Jonesianum* must not, however, remain here after its growth is finished, but be removed to the Mexican house, where it should be wintered cool and dry. *Odontoglossum Roezlii* should have a corner in the East India-house if a place can be found where moisture condenses at night. It is a plant that delights in great heat and moisture whilst growing if the house be ventilated to ensure a circulation of fresh air. The plants should not now be allowed to become dry at the roots, although on the other hand more mischief may be done them if they are kept in soddened materials. It is an aid to healthy development in the plants to sprinkle Peruvian guano on the paths, or damp down with manure water at night. This is preparatory to the ripening process that follows in the autumn.

THE COOL HOUSE.—*Sophranitis grandiflora* and its varieties, *S. rosea* and *S. coccinea*, are pretty, small-flowered Orchids, which grow best in small pans suspended near the roof. Plants of them are growing freely about this season, and will need a plentiful supply of water at the roots. *S. violacea* must have the warmth of the intermediate house, otherwise the same kind of treatment suits the plant. *Oncidium cheiroporum* grows better in the cool house than in any other if care be taken to keep the water out of the young breaks, these being very liable to damp off if they are wetted whilst young.

THE CATTLEYA HOUSE.—Our plants of *Cattleya Warneri* were re-potted some few weeks ago, and they are freely pushing roots into the fresh potting materials. The plants are close to the ventilators, and have therefore a great deal of air and of sunshine. In order to rest them and ripen the latest made growths, so as to ensure plenty of blooms next year, very little water should be afforded them now—just enough to prevent shrivelling of the pseudobulbs. *Cattleya gigas* should be repotted at this season, when the flowers are past, or in the case of plants which have not flowered, when the pseudobulbs are ripe. I prefer to keep the plants in small pots, if pots are employed, but my plan is to grow them in baskets of Teak wood. *C. gigas* should be put, after repotting, in a similar place to, and treated the same as, *C. Warneri*.

THE KITCHEN GARDEN.

By G. WYTHES, *Gardener, Syon House, Brentford.*

TURNIPS.—A good breadth of Turnips should be sown for autumn and winter use. I usually sow at this date Veitch's Red Globe for use at the beginning of winter, and Golden Ball, which will keep good till late in the spring. Both are hardy Turnips, that always keep well. Where yellow-fleshed kinds are not favoured, the variety Chirk Castle Blackstone may be sown; it is hardy, and well-flavoured.

CARROTS.—A sowing of Short Horn Carrot made at this time will be found of use to draw in

the autumn, and help out the winter supply of large kinds.

ONIONS.—The autumn-sown Onions are often valuable in places where the spring-sown ones do not succeed, and many gardeners are enabled to grow autumn-sown who fail with the others. Choose good ground that is well tilled, so that growth shall be rapid. After digging the land, strew plenty of soot, wood-ashes, and burnt garden-refuse on the surface, and work it in with a fork to about a depth of 6 inches. This will be found preferable to using farmyard or stable manure. If the ground is dry, water it heavily.

SPINACH.—Make two sowings of this vegetable, one early in the month, and another one month later. This crop requires more careful preparation of the ground than Onions, and a heavy coat of manure should be dug into it about two spits deep, but where the land is in good heart, I have found that liberal dressings of fish-manure or of Peruvian guano are good substitutes for other stable or farmyard manure. Land should be selected which has not been recently cropped with Onions, Carrots, or Spinach—plants that are liable to be attacked with wireworm and the grub. When the ground has been got into condition for sowing, it should be trampled evenly, large stones raked off, and the surface levelled, it may then be rolled or not as may be deemed advisable, before the drills are drawn, but in any case it should be firm land, the plants getting a better hold, and going deeper than in loose soils. After the seed is sown it should certainly be rolled. If the rows are 18 inches apart it will not be too wide. If the sowing cannot be made just after rain, water the drills, and sow directly. Of late years I have sown the Improved Round Victoria in preference to the prickly-seeded winter Spinach, it being in every way superior to that kind, and it does not run to seed so readily, and is very hardy. These large-leaved varieties require the rows to be from 18 inches to 2 feet apart, or the plants crowd each other. Another sowing made the middle of September may be sown in closer drills.

FRENCH BEANS.—Some seed may still be sown on warm sheltered borders or under a south wall, and in such a place some kind of glass protection can be usually put over them in the event of frost in September. An early-fruited kind should be sown, and the drills made of moderate depth. Of varieties of French or Kidney Beans Mobawk and Ne Plus Ultra are good for the purpose, the former better than the latter at this season, sowing 2 feet apart between the rows in well-manured land. Beans now in bearing should be supplied with liquid manure, and the pods gathered daily.

SCARLET RUNNER BEANS.—Do not let the plants suffer for want of moisture, particularly if the land is light. Liquid manure should occasionally be afforded. Late sowings should be topped, and all will be benefited by a mulch of short dung.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

DAHLIAS.—In order to secure fine blooms, the plants should be kept uniformly moist at the roots, and the shoots well thinned to let in the light; and to do this, all weakly growths should be cut away, and the stronger fastened to stout stakes, which ought to be placed out of sight as much as possible. Where a mulch is not objectionable, it should be applied at once. I am here only referring to ordinary decorative plants, because for show purposes only a limited number of blooms should be allowed to develop, and liquid manure afforded gives size to the blooms. Earwigs are destructive insects, spoiling the flowers; and to trap them, a flower-pot half filled with moss, or a Bean-stalk, should be placed among the plants, and the insects destroyed daily.

BORDER CARNATIONS.—Plants of the dark-coloured and white Clove Carnations, especially those growing in light soils, should be kept moist at the roots, and if not already done, the flower-buds on either side the central or crown bud may with advantage be removed, as it is necessary to take 2 inches of the flower-stem when the flowers are cut; moreover, these side buds seldom develop into passable blooms. However, in order to prolong the season of these Clove Carnations, it will be necessary to remove the flower buds that surmount the flower-

stalks, and allowing the two side-buds to develop, which they will do later.

HERBACEOUS AND ANNUAL PLANTS.—Many of these plants are at their best during the present month. These include Delphiniums, shrubby and herbaceous Phloxes, Spiræas, Rudbeckias, Eryngiums, Heleniums, Gaillardias, Funkia Sieboldiana; and (of annuals) Zinnias, Clarkias, Eucharidiums, Shirley Poppies, which make a fine show of brilliant and varied shades of brilliant and varied shades of colour; Coreopsis, Cornflowers, Larkspurs, &c. Where necessary water should be afforded the plants, and support should be given to the taller growing subjects. Remove decayed leaves and flowers, so that these do not mar the general effect.

PLANT-VASES, ETC.—In many gardens well-filled vases of mixed plants or of Pelargoniums contribute to the gay appearance; and these should receive attention in the matter of surface-dressings of some sort of plant manure before affording them water, and as these subjects do not benefit much from the rain, watering should be copious and frequent. Pinch out the points of strong shoots, and keep the plants clean and trim.

PELARGONIUMS.—Wherever the removal of cuttings of the Pelargoniums will improve the appearance of the beds, the cuttings should be taken forthwith, putting them in shallow boxes properly provided with drainage, and filled with a light kind of loamy soil, and surfaced with sand. The cuttings may be put in at about 3 inches asunder, the boxes stood in a dry situation exposed to the sun, and the cuttings sprinkled every afternoon on bright days.

FRUITS UNDER GLASS.

By J. RIDDELL, Gardener, Castle Howard, York.

VINES.—Where the Grapes in the late houses are changing colour, the sublateral shoots should be removed, and those at the ends of the rods stopped, following these manipulations with a liberal top-dressing of the border with manure containing phosphate of lime, and a heavy watering to carry the manure down to the roots. When the Grapes are to hang for a considerable period in the ripe stage, the border should be mulched with half-rotted leaves and stable manure from which the greater part of the straw has been taken out, or some spent Mushroom-bed dung, which will maintain a dry atmosphere in the house, by checking evaporation from the soil. In dry weather air should be admitted to the vinery at all times, but carefully guarding against sudden changes of temperature. It is also necessary to observe these details whilst the fruit is ripening, when such varieties as Madresfield Court, Mrs. Pearson, and Gros Colman, are grown. Although air may be admitted at night, still a minimum of 60° must be observed till the fruit is finished. Should red-spider and thrips be present, these must be dislodged by the sponge in the case of the former, and the latter by fumigation on three consecutive nights, choosing cool, still nights, if possible, for this operation. Be sure that any Vines that have ripened their fruit are not getting dry at the root, and when watering the borders, let it be done in the morning when the weather is bright and warm, and in order to evaporate much of the moisture present in the air of the vinery that has been watered, open the ventilators to their full extent, and maintain a brisk warmth in the heating-apparatus.

EARLY FORCED VINES.—Stop or cut back all shoots of recent growth, and do all that is possible to mature the wood.

ORANGES.—Fruits approaching ripeness will be improved in flavour by a less moist atmosphere being kept than was advised at an earlier stage, the syringe being now dispensed with. Employ some kind of fertiliser whenever water is afforded the trees if they are heavily cropped; still those plants which are in vigorous health and bearing but a moderate crop will need no stimulus in that way. The strong-growing shoots which may be unduly taking the lead should be pinched at the points, and twiggy weak growth cut away when the head is likely to get crowded with wood, which will tend to the proper ripening of the shoots.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Moreworth Castle, Maidstone.

GENERAL HINTS.—Just now work amongst fruit trees abounds, and will so continue till all the training, summer pruning, and the in-gathering of the

fruit are finished. Peach and Nectarine trees are now making rapid growth, and must be attended to without delay; the earliest to fruit being those to receive first attention, training the shoots thinly but evenly all over the trees, and any of the weaker shoots that may not be required, or those which are not likely to bear fruit next year, should be cut back to two eyes; all sub-laterals should be removed, and the points pinched out of all those shoots that have extended beyond the allotted space, securing all shoots. The earliest varieties will have ripened their fruit, and the garden engine should be got to work to wash the foliage, repeating the operation till all red-spider and thrips are cleared off. In bad cases use soap-suds or a weak solution of soft soap and sulphur. The soil should be examined, and, if dry, it should be well soaked for several feet around with manure water, and some more mulching placed on the soil. Fruits of Hale's Early, Early York, and Early Dagmar will now be approaching ripeness, and should not be syringed until the fruit is gathered.

There will be the usual expenditure of time in preserving the fruits from damage by earwigs, wasps, bees, and flies. The most certain way of catching earwigs is to place pieces of Bean-stalks, or anything that is hollow like them, at intervals all over the trees, sticking the ends under the branches. These must be examined daily, and either blown out or shaken into a pail containing hot water; very choice fruits, or some special purpose may be protected with pieces of muslin, the points of the fruits being the place first damaged by the earwig. Flies, bees, and wasps, may be caught in bottles of sweetened beer, or under double hand-glasses baited with fruits.

PLANTS UNDER GLASS.

By R. MILNER, Gardener, Penrice Castle, Swansea.

HARD-WOODED PLANTS.—Ericas, Epacrises, Indian Azaleas, soft-wooded Heaths, Boronias, Pimeleas, and other similar plants, whose growth for the season is complete, may be stood in the open air for some few weeks, the exposure greatly assisting the ripening of the wood and development of flower-buds. The plants should stand on boards or trellis-work, tiles, &c., or failing these, on a bed of coal-ashes, and the pots protected, in so far as regards the outer row, with boards, strips of bark, or they may be half plunged in the coal-ash bed, the direct sun's rays shining on the pots parching and injuring the roots greatly, if this be not done. Full sun all day long is also not desirable. Small plants should have the pots dropped inside of others several sizes larger. There should be some means adopted for protecting the plants from heavy rains, hail storms, &c. Freshly potted plants are best if kept under glass for a few weeks longer; a cold pit suiting them well. Care must be taken in affording these water at the roots, and use only rain water or that from ponds. Keep a watch on the plants for the powdery mildew, dusting affected parts with flowers of sulphur on first observing it. The Indian Azaleas are very liable to be infested with black thrips whilst under glass, so that when they come out of doors there is a good chance of easily washing them with soft soapy water, or a mixture of tobacco juice and water, and in fine weather overhead syringing in the evening is very beneficial. Any specimen which blooms late and may require repotting should now have attention. Do not afford large shifts, and always pot firmly both large and small plants, using peat of the best quality; a liberal amount of loam for large plants, and a good quantity of sharp silver-sand, and a small portion of fine charcoal.

Heaths, which flowered for some considerable period of time and are now gone over, must have their seed-vessels and dead flowers carefully cut off, and small plants which may have become pot-bound, and only those, should be afforded a shift into pots two or three sizes larger, afterwards keeping them close for a few weeks until the roots take possession of the fresh soil. Nothing injures heaths so much as watering them as soon as they are potted. It is better to stand them on a bed of damp sand or coal-ashes in a pit, which will avoid the need to water them before the roots have penetrated to some extent the damp potting soil.

ACHIMENES.—Early-flowered pans will now have finished for this season, and may be removed to a pit and given full exposure to the sun, and sufficient water to keep the soil moist till the foliage begins to change and die off naturally. If this treatment be pursued with Achimenes, there will be no need to fear a scarcity of tubers at potting time.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should not be sent to the Editor, but to the Publisher.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62° S.

The Potato Disease and the copper treatment.

So far there is but little evidence of the Potato disease this year, but nevertheless Messrs. JAS. CARTER & Co. are trying in a field near Bromley (Kent) an interesting series of experiments to test the efficiency of sulphate of copper as a preventive of the Potato disease. The Potatoes were planted on April 8 in drills 36 inches apart. The sorts planted were Myatt's Ashleaf, Snowdrop, Beauty of Hebron, White Elephant, King of Russets, Cosmopolitan, Magnum Bonum, Bruce, Surprise, and Imperators. Of each of these two rows were planted side by side, two third portions of the rows being treated to a spray of the Bordeaux mixture on July 11, and again on August 2, the other third portion of the same rows being left untreated. So far, as we have said, there has been little or no disease visible this year, so that the efficiency of the copper solution in checking its ravages is not yet fairly tested. It is obvious, however, that the effect of the copper has been to check slightly the growth of the haulm and foliage, as the plants not subjected to the spray were the more vigorous. Here and there symptoms of scorching were visible on the leaves to which the spray had been applied, and it will be interesting to note which varieties are the most liable to be injured in this way.

The composition of the solution used is 11 lb. of sulphate of copper, 11 lb. of lime, and 100 parts of water. This quantity is sufficient for half an acre of Potatoes, and the total cost of the materials and of the labour is estimated at about £1 an acre. The mixture is of a pale blue colour, and is kept stirred. It is applied by a knapsack pump with a fine spray-nozzle of the French pattern, and by a similar apparatus manufactured

by Mr. STRAWSON. Armed with one of these machines a labourer passes between the rows, distributing the fine spray over and, as far as possible, also beneath the foliage. The results will be watched with interest, for in spite of failures and uncertain results there can be no question that we have in these copper solutions an important aid in combating the disease. Great care is, however, required in manufacturing the solution, so as to be sure that the acid caustic effects of the sulphuric acid shall be duly neutralised by the lime. What is aimed at is the deposit on the foliage, not of sulphate of copper, which is a caustic poison, nor of lime, which is scarcely less caustic, but of the neutral oxide of copper which results from the admixture of the copper salt with the lime. This oxide is injurious to the fungus, but not, or only slightly so, to the foliage of the Potato.

The reader is referred to an interesting contribution to the Scientific Committee, made by Dr. RUSSELL, and reported in another column, wherein that eminent chemist calls attention to the care required in making the solution.

As the fungus threads are not confined to the surface, but are in the substance of the haulm, and in the tuber, it must not be expected that the spraying with copper will absolutely prevent or destroy all the fungus; it will prevent the new spores from germinating on the surface, but it cannot touch the threads in the substance of the plant. There will probably, therefore, be a small percentage of diseased tubers at lifting time, whether the spray has been applied or not. All that can be expected is, that a considerable proportion of the crop, which otherwise would be sacrificed, will now be saved. It becomes a practical question whether this saving will justify the expense. In considering this point, we must not overlook the future as well as the present. It is not only the marketable tubers of the present, but the Potatoes used for seed in the future that have to be considered, and when due weight is given to these considerations, we cannot doubt that even in those cases where no disease occurs, and where, therefore, the use of the copper becomes needless, the check to growth is so small, and the cost of application so little, that the loss will be inconsiderable, and must be classed under the head of insurance—in fact, that the use of the copper solution will be found commercially profitable, as well as medicinally effective.

We have no exact data to go upon, but from what we have seen in former years we are disposed to think that for small growers, allotment holders, and cottage gardeners, the adoption of the Jensen system of high-moulding will be preferable to the use of the copper spray. In any case it is satisfactory to find that by either plan we have a means of attacking the dreaded enemy with a certain measure of success.

It is also satisfactory to find that the disheartening period of apathy and inaction has passed, and that growers have at last been stimulated to try some of the measures which have been pressed upon them for so long. There is still a great deal to be done in the way of destroying by fire affected haulms and tubers, and thus destroying the fungus instead of favouring its growth and scattering it broadcast, as is commonly done. But now that a beginning has been made, and now that the lecturers on practical agriculture and horticulture have the power of calling the direct attention of the cultivators to the best means of coping with the disease, we trust that the days of "do-nothing" are past. We cannot entirely stamp out the disease, but we can certainly muzzle it.

EPIDENDRUM VITELLINUM MAJUS.—The plant figured on p. 159 was engraved from a photograph kindly sent us by Major-General C. B. LUCIE SMITH, of The Acacias, Worthing, with the accompanying particulars about the plant:—"I have blooming at present in my cool house a plant of *Epidendrum vitellinum majus* in a 7½-inch pan, having 18 spikes and 172 flowers of exceptionally fine colour and substance. I obtained the plant when semi-established, in April, 1891, and it is now (July 2, 1892) flowering for the first time." Our readers will readily admit that the plant is an extremely fine one, and that it has produced an extraordinary number of flower-spikes and flowers. Most cultivators of Orchids would recommend the removal of so heavy a crop of bloom after the lapse of a month from the time the first bloom opened, so that the plant might not be unduly weakened, and the prospects for next season spoiled.

ROYAL HORTICULTURAL SOCIETY.—On Tuesday, August 9, 1892, a flower show will be held in the Drill Hall, James Street, Westminster, when prizes will be offered to amateurs for Fuchsias, and a paper on "Fuchsias" will be read by Mr. GEORGE FRX, at 3 P.M. On Tuesday and Wednesday, August 23 and 24, a great exhibition of Begonias, Apricots, Plums, Ferns, &c., will be held in the Society's gardens at Chiswick, and there will be a Conference on each day at 2 P.M.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the Committee took place at the Hotel Windsor on the 29th ult., Mr. W. MARSHALL, Chairman of the Committee, presiding. Among the special receipts announced were donations of two guineas each from the Chairman and Mr. H. HERBST; from Mr. G. W. CUMMINS the sum of £8 1s., the proceeds of a Rose Fair held in connection with the recent annual show of the Croydon Horticultural Society; from Mr. WILLIAM DEAN, Birmingham, the sum of £3 3s., a moiety of the proceeds from the sale of flowers at a Rose Show recently held in the College grounds at Moseley; and 15s. from Mr. A. J. BROWN, School of Handicraft, Chertsey.

ORCHARDS IN TASMANIA.—We had it the other day, on the authority of Sir E. BRADDON, K.C.M.G., that the area of orchards in the colony of Tasmania is gradually extending. It is felt that there is a great future for the trade in fruits—especially good Apples; and as fruit trees take some years to arrive at the profitable condition, no time should be lost in "sticking in a tree here, and a tree there." A statement recently passing current as truth requires contradiction here. It was to the effect that the Tasmanian Government would sell orchard lands on more favourable terms than now obtain, provided they are at once taken up. The Agent-General in London flatly contradicts this. Possibly a paragraph in one or two journals of the day, to the effect that "hands" accustomed to Apple-orchard work were wanted, has been transformed into the other piece of "news."

MARKET GARDENING IN THE TRANSVAAL.—A "recent arrival" writes from Johannesburg, in the Transvaal:—"The Boers seem a century behind the folks at home. . . . Shops kept by English and other settlers give a lively appearance to the place. . . . Butcher's meat is wonderfully cheap, which is more than can be said of market-garden stuffs: we pay 20s. for a sack (not over large) of Potatoes; and Cabbages range from 3d. each and upwards—more 'upwards,' as we pay 5d. and 6d. each for not over-grand specimens of the tribe."

VANILLA DISEASE.—Mr. GEORGE MASSEE describes in the last number of the *Kew Bulletin* (May and June) a disease affecting the Vanilla plants in the Seychelle Islands. The disease is caused by a microscopic fungus, *Calospora vanillæ*. The fungus passes through various stages, presenting a very different appearance in each, so that each received a distinct name before it was ascertained that the several forms were all stages of one fungus. The mischief to the living plant is caused entirely

by the "Hainsea" form of the fungus, as the *Cystispora* and *Calospora* forms only appear when the leaf is already killed. Basing his recommendation on the known facts of the life-history, Mr. MASSEE recommends that all the fading and dead leaves be removed and burnt at once, as the continuance of the disease depends entirely on the presence of such diseased leaves. Mr. MASSEE farther adds that all stages of the above disease have been observed at Kew on various species of *Oncidium* and *Dendrobium*.

THE FERTILITY OF PEATY SOILS.—There is a

from plant residues. In this respect, the scientist is not in discord with the practical man.

THE SOURNESS OF FRUITS.—From recent researches by L. ROOS and E. THOMAS, it appears that during the first ten or twelve weeks of vegetation of the Vine a sugar (a saccharine) exists in the leaves, sap, and even in the Grape. This is contrary to the accepted theory of PETIT, but the new results appear to be beyond question. In the fourth month of vegetation this sugar disappears, and the organs specified then contain a mixture of other sugars, in

insecticide and a fertiliser, and which is manufactured from alkali waste. The "lime-mud" obtained in making caustic soda or black ash is mixed with unslaked lime, moistened, and then dried and powdered. It is then ready for use, and may either be sown broadcast or, mixed with water, may be sprayed over infected trees and plants.

NATIONAL AMATEURS' GARDENERS' ASSOCIATION.—A party numbering nearly fifty members of the above had their usual outing on Saturday, July 23, visiting Messrs. H. CANNELL & SONS' Nurseries at Swanley

FIG. 29.—EPIDENDRUM VITELLINUM MAJUS: COLOUR OF FLOWERS, ORANGE-SCARLET.

paper in a German contemporary (*cide Landw. Jahrbuch*, xx., pp. 909—928) by C. L. WIKLAND, dealing with the phosphoric acid of soils and its estimation, in which it is stated that the attempts which have been made to ascertain the fertility of soils by means of chemical analysis have met with little success, owing, largely, to the want of vegetation experiments, showing the physiological value of the nutritive matters dissolved by the various reagents. He considers that, of all soils, those which are peaty seem most likely, when subjected to complete analysis, to yield results which would indicate high fertility, such soils being almost wholly derived

which glucose predominates. But the increase in the absolute amount of sugar does not correspond to the diminution in acidity, and hence it is not always true that the sourness of fruits diminishes in proportion to the approach of ripeness. The diminution in the absolute acidity is observed at the moment when the amount of leuculose perceptibly increases in the fruit. For farther details, a paper in the *Comptes Rendus*, vol. cxiv., p. 503, may be consulted.

A NEW INSECTICIDE AND FERTILISER.—In America experiments have recently been conducted with a substance which is said to be both an

and Eynsford. The party was met by Mr. CANNELL, sen., who conducted them to his nursery at Swanley, and showed them over his numerous glasshouses, where much was noticed that delighted and surprised them. A luncheon was served at 5 o'clock in a neighbouring Inn; the party afterwards proceeding to Eynsford, where Mr. CANNELL has a farm, and seed, fruit, and tree nursery, which brought their very enjoyable visit to a finish about 8 o'clock.

EXHIBITION AT EARL'S COURT.—A special show of Carnations, Picotees, and garden produce took place on Monday last, August 1, in connection with

the International Horticultural Exhibition at Earl's Court. The show, which extended over the two following days, was not so good as might have been anticipated from the somewhat comprehensive schedule, and the competition, which was in some few instances fairly good, was not so keen as is usually the case.

CHINA-GRASS.—Some time since we drew attention to the fact that a French manufacturer has placed on the market, in competition with what is known as "Woollenised jute," beautifully prepared China-grass, of a variety of shades of colour, ready for the spinner to work up into upholsterers' wares. After a very brief interval, we had to record that the patentees of the woollenised jute had outdone the French manufacturer; to-day we have to note that the latter has very much improved on his first efforts in utilising the "grass," and has placed on the market an article which is certainly a great advance on his previous effort in colour, sheen, and softness. The chemist has been called in to furnish a solution, after taking up which, the fibre can with perfect safety stand preparation by hot rollers. The price, we hear, is also in favour of the material; and now we await the further improvement by our friends in Dundee!

"DICTIONNAIRE PRATIQUE D'HORTICULTURE ET DE JARDINAGE."—This is a French translation of Nicholson's *Dictionary of Gardening*, the utility of which we have daily opportunity of testing. The French edition supplies some deficiencies in the English text, as well as some details suitable for the different conditions of French gardening. OCTAVE DOIX, 8, Place de l'Odéon, Paris, is the publisher.

PETER LAWSON AND SON, LIMITED.—The Directors' statement of the Company's affairs as at June 30, 1892, including the balance brought forward, shows the sum of £6224 12s. 9d. at the credit of profit and loss, and the Directors recommend that a dividend of 10 per cent. per annum, on the paid-up capital of the Company, free of income-tax, should be paid on September 1 next; also, they recommend that £1500 be added to the reserve fund, and that the sum of £2974 12s. 9d. be carried forward to next year's account. The Directors recommend the election of Mr. DAVID SYME, their present Manager, as a member of the Board of Directors. The annual meeting will be held at the office of the Company, 1A, George IV. Bridge, Edinburgh, on August 17.

HESSLE AND HOWDENSHERE HORTICULTURAL SOCIETY.—This was the first exhibition of this newly-formed Society, designed to take the place of the old Hull Society, which became defunct a few years ago. It took place on July 27 and 28 in the grounds of Tranby Lodge, Hessele, and was most successful, large numbers of persons being attracted from Hull and other places to see the display. A good beginning was made, as four large tents were required to take the exhibits, and valuable miscellaneous collections were sent by Messrs. F. Sander & Co., St. Albans; E. P. Dixon & Sons, Hull; Charlesworth, Shuttleworth & Co., Heaton, Bradford; W. Cutbush & Son, Highgate, London; W. Clibran & Son, Altrincham; G. Cottram, jun., Cottingham; W. Edwards & Sons, Sherwood, Nottingham; W. E. Martin, Hull; and J. R. Pearson & Sons, Chelwell; to all of which special awards were made. The leading and most successful exhibitors of plants, &c., were Mr. G. Wilson, gr. to Jas. Reckitt, Esq., Swanland Manor, Brough; J. Leadbetter, gr. to A. Wilson, Esq., Tranby Croft; Mrs. Mellish, Hedsock Priory, Workson; Geo. Jarvis, gr. to B. Whitaker, Esq., Cliffe House, Hessele; J. Bridle, gr. to R. Falconer Jameson, Esq., Hessele, Hull; G. Cottram, jun.; J. H. Goodacre, gr. to the Earl of Harrington, Elvaston Castle; Perkins & Sons, Coventry, &c. A Certificate of Merit was awarded to a very promising new light Rose raised by Messrs. G. Swales & Co., the Nurseries, Beverley, from Comtesse de Serenye, and named Mrs. Arthur Wilson. A large number of horticultural appliances were exhibited in various parts of the grounds.

THE OXFORD CARNATION AND PICOTEE UNION.—The eighth annual exhibition of Carnations took place in Mr. Dodwell's garden, Stanley Road, Oxford, on the 2nd inst., two spacious tents being required to accommodate the blooms sent for competition. Scarcely one of the northern growers was able to compete owing to the backwardness of the season; but Mr. M. Rowan of Clapham, who was 1st with twelve fine blooms of Carnations; Messrs. Read and Chaundsey, of Oxford; Thomson & Co., and R. Sydenham, of Birmingham; W. Bacon, of Derby; F. Hooper, of Bath; J. J. Keen, F. Nutt, and W. Rebbeck, all of Southampton; C. Phillips, of Reading, and others staged very fine blooms indeed, and it was considered to be one of the best exhibitions ever held in Oxford; the quality of many of the flowers being very high. A considerable number of new varieties were staged, and several First-class Certificates of Merit were awarded. Mr. Dodwell's garden was singularly bright and effective with Carnations, thousands of expanded blooms being on view in addition to those submitted for competition.

CHICAGO EXHIBITION.—Costa Rica's pavilion at the World's Fair will be surrounded by gardens ornamented by a profusion of tropical plants, and in the galleries of the pavilion will be placed more than 3,000 beautiful birds, many of which have very gorgeous plumage. France intends to show its skill in landscape gardening at the World's Fair. A cablegram has been received from the French Commission asking that it be allowed to do, and bear the expense of, the "whole decoration of the spaces surrounding the Horticultural and the Woman's buildings." This generous offer, doubtless, will be accepted if it does not interfere with plans too far advanced to be changed. The French are world-renowned as artistic landscape gardeners, and, it is believed, they would hardly have made the offer referred to unless they intend to make a display of surpassing beauty. The Commission asked also for 60,000 square feet for the French horticultural exhibit.

PRESENTATION TO MR. AND MRS. E. S. DODWELL.—This being the jubilee year of the marriage of Mr. and Mrs. Dodwell, advantage was taken of the annual exhibition of the Oxford Carnation Union in Mr. Dodwell's garden, Stanley Road, Oxford, on the 2nd inst., by a few personal friends to present Mr. and Mrs. Dodwell with a piece of plate in commemoration of the event. The weather was fine, and admitted of a large party sitting down to the luncheon at which the presentation was made, Mrs. Dodwell being present, with many members of the family, and a number of ladies and gentlemen.

EPWORTH.—The annual flower show was held on Monday, Bank Holiday, August 1, in the Rectory Grounds, kindly lent for the occasion by the Rev. Canon Overton, D.D. The schedule of prizes was much larger than before, and the cottagers came out strongly, and several gentlemen sent non-competitive exhibits. The strong features of the show were hardy fruit, Potatoes, Celery, and cut flowers. The Society is fast growing in importance, and Mr. F. GRANT, High Street, Epworth, is the Secretary.

FLOWERS IN SEASON.—We have received from Messrs. LAING & MATHER, Kelso, some flowers of a very nice flesh-coloured Carnation, of the size of a good Clove Carnation, and with grateful fragrance. It is a fine bloomer, with a perfect calyx. Under the name of Lady Nina Balfour it was recently certificated by the Caledonian Horticultural Society.

SPRING GROVE HOUSE, ISLEWORTH.—The grounds of this historic house were, on Thursday, July 28, the scene of the Hounslow Horticultural Society's annual show. Some excellent groups, good fruit, and generally meritorious productions of the neighbouring gardeners and nurserymen, were staged. Spring Grove is the residence of Mr. PEARS, the soap manufacturer, and is being greatly improved in every way.

TESTIMONIAL.—On Saturday, July 30, a marble timepiece was presented to Mr. W. M. BAILLIE, gardener at Luton Hoo, by the men employed under him, as a mark of respect and esteem, on his retiring from the charge of the gardens.

UTRECHT.—Our correspondent, Mr. J. K. BUDDE, has been appointed Curator of the University Botanic Garden, a post for which his experience in the Edinburgh Botanic Garden and elsewhere well fits him.

BRUSSELS HORTICULTURAL EXHIBITION.—The show was held simultaneously with the National Independence *fetes*, and in the Orangery and adjacent houses in the Botanic Garden, under the auspices of the Royal Floral and Linnean Societies. Collections of mixed Orchids were staged by MM. G. VINCKE-DUJARDIN and A. A. PEETERS, each of which contained 250 plants. In the collection of the first-named exhibitor we noticed a fine *Eriopsis biloba*, *Cattleya gigas Sanderiana*, with large dark lip; C. Leopoldi, *Odontoglossum Harryannum*, with floral racemes 2½ feet long, and twenty blooms; *Lælia grandis tenebrosa*, *Oncidium Lanceanum*, *Odontoglossum Alexandræ guttata*, *Masdevallia magnifica*, *Oncidium Kramerianum*, O. Forbesi, *Phalænopsis amabilis grandiflora*, *Masdevallia Backhousiana*, *Oncidium Forbesianum aureum*, *Cattleya Gaskelliana*, the lip purple, with scarcely any yellow; C. *Mossia grandiflora imperialis*, *Vanda Kimballiana*, very rare; *Oncidium papilio grandiflorum*, *Cattleya Gaskelliana pallida*, *Cypripedium J. H. Haywood*, a hybrid flowered in Belgium for the first time; *Vanda aurea*, also bloomed here for the first time; *Odontoglossum hystrix*, O. *Pescatorei*, and *Lycaste Skinneri alba*. M. PEETERS showed *Grammatophyllum Ellisii*, rare and beautiful; *Cypripedium Chamberlainianum*, *Cochlioda Nötzliana*, a novelty; *Phajus Humboldtii*, *Oncidium macranthum*, *Dendrobium filiforme*, with twenty shoots; *Odontoglossum cristabellum*, O. *mulus illustris*, O. *virginalis*, O. *crispum guttatum*, *Miltonia vexillaria*, *Cattleya Brymeriana*, C. *Warscewiczii*, &c. M. VINCKE-DUJARDIN also showed seventy-five good varieties of *Odontoglossum*, in which some specimens with five clusters bore sixty-six blooms. One variety had a large lip, much speckled, long, streaked with brownish-purple; another had purple sepals and white petals—sepals, petals, and lip spotted, the latter bordered with white; a third bore large flowers, spotted with orange; a fourth was spotted with carmine.

NEW PLANTS.—JACOB MAKOV ET CIE., of Liège, showed at the Brussels Exhibition a fine *Maranta Leopoldi*; *Nidularium striatum*, streaked with yellow; *Carludovica palmefolia*, *Dieffenbachia Lorenzi*, *Maranta iconifera argentea*, foliage white at base; *Vriesia Kitteliann*, a curious hybrid; *V. conferta*; *Cupania filicifolia Makoyana*, finer than the type, and more easily propagated; *Pandanus* sp. with elegant foliage. The following new *Anthuriums* were staged:—A. *Andreanum Madame Gilkinet*, spathe white, striped with purple; *Emile Dœne*, spathe orange; *Wilhelm Pitzer*, spathe blood-red, of unusual size; these three were from JACOB MAKOV ET CIE. M. PEETERS sent A. *Rothschildianum*, *Grande Duchesse*, A. de Luxembourg, spathe large, rounded; *Trésorier Ph. Janssens*, spathe prettily shaded; A. *Scherzerianum Secrétaire* Lubbers, large dark-red spathe, from M. DE CRAEN-LONGÉ; A. *Souvenir de Jules Pererbaix*, of the *Rothschildianum* class, a fine well-spotted spathe from M. L. DE SMET. MM. DE SMET FRÈRES sent twelve fine Palms:—*Chamærops gracilis*, *Cocos campestris*, *Phoenix rupicola*, *Brahea glauca* (Roezli), shown for the first time, very white, and the upper part of petioles peculiarly marked; *Phoenix turbanni*, a variety of *canariensis*, but with more slender leaflets. M. DE CRAEN-LONGÉ also sent good specimens. M. P. BINOT, of Petropolis, showed a complete collection of Brazilian Orchids, *Cocos Weddelliana*, and seeds. *Ch. de B.*

ODONTOGLOSSUM NAT. HYB.—This fine *Odontoglossum* has flowered for the first time; it is a good Pacho, flowers rounded and large, white with purple

edges, of beautiful texture with large deep purple spots on sepals and petals; lip large, rounded, spotted with clear brown; the flowers growing in a close cluster. Shown by M. G. VINCKE-DEJARDIN at the Brussels Horticultural Exhibition on July 21. Awarded a medal.

CYPRIPEDIUM YOUNGIANUM.—*C. selligerum* × *C. Veitchii*; it has the form of *selligerum*, the markings of *Veitchii*; the lip is the colour, the petal the form of the former, the shape of the lip and markings of the petal are those of the latter, while the colour is paler. Shown by the above-mentioned exhibitor on the same occasion.

CYPRIPEDIUM HYB. VAR. NOV.—Shown by M. A. A. PEETERS (*Lawrenceanum* × *concolor*), a remarkable flower, in form like *Lawrenceanum*, in colouring a peculiar mixture of both parents.

EPIPHYLLUM MAKOYANUM.—M. GUILLE DE BOSCHERE, at Berchem, Antwerp, has a fine specimen grafted on a stem 7½ inches long; the head is fan-shaped, 1½ foot long; the plant has 261 flowers and buds. *Ch. de B.*

HYBRID BETWEEN BLACK CURRANT AND GOOSEBERRY.—Mr. CULVERWELL writes, "You will be pleased to hear that my hybrid black Currant and Gooseberry is bearing fruit; there are only a few; possibly some were destroyed by the frost in April. The Gooseberries here suffered severely at that time. This shows that you were right in saying the flowers were perfect, and you saw no reason why they should not bear fruit. The fruits hang in pairs, unlike the Gooseberry, and are changing colour; they are in shape like a Gooseberry, and larger than the Currant. I shall be glad to send you a few of the fruits to see, if you wish it, for curiosity, when ripe. [We shall be very curious to see the fruits in question.]"

MONSTROSITY OF MACROZAMIA SPIRALIS.—Baron VON MUELLER writes that Mr. CH. CRESWELL, of Sydney, states that he recently found, near Port Jackson, a female cone of *M. spiralis*, which tapered at the top into a male portion 6 to 8 inches long. He did not observe it at once, and afterwards could not find it again. We are familiar with similar changes in Conifers, but have never met with them in Cycads. The interest would be so great that we trust Mr. CRESWELL will be able shortly to rediscover his plant.

TECHNICAL EDUCATION.—We have before us a report from the department of Agriculture of the Yorkshire College, Leeds, which is one of the colleges connected with the Victoria University. It is very encouraging to find that professors and lecturers in agriculture and the sciences connected with it have been appointed, and that they have already done good work. Practical work on the farm as well as attendance on the lectures are required, in order that a certificate of proficiency may be obtained. In addition to this, lectures to and classes for farmers have been started in various centres, and these we learn have been successful beyond the most sanguine anticipations of the Committee; indeed, the word "enthusiasm" creeps into a sober report on the subject. Next winter courses of lectures on practical subjects will be again given in various districts, each lecture to be followed by a class at which questions may be asked from the lecturer. Examinations will be held at the close of the course, and those who pass them successfully will receive certificates from the Victoria University. Horticulture will probably have its turn. All this is encouraging.

— In *Natural Science*, Mr. J. PERCIVAL discourses of the progress made by horticultural education in Surrey. In one district in the county allotment gardens are established for young men, whose work is superintended by experienced gardeners. Lectures on plant-life are given occasionally. The class who benefit most by the scheme is said to be that which includes labourers, who are proud of their garden, the ordinary country gardener being usually ignorant of the things he

should know most about, and too conceited to accept instruction.

BRITISH GUIANA.—A correspondent having asked for information as to wages and other matters interesting to a gardener proposing to migrate to that colony, we availed ourselves of the kindness of Mr. EVERARD IM THURN, now in this country, and who has obligingly given the following replies, which sufficiently indicate the nature of the questions put:—

"1. An unrecommended man would probably find some difficulty in getting a situation as overseer; but if this were in any way obviated, the highest wages the beginner could expect would be about £50 per annum, an unfurnished room and board.

"2. Flannel shirts, thick knitted socks, old trousers and coats, wide-brimmed felt hat, and a decent black coat to wear at the Manager's table.

"3. An overseer's life is a hard one, and one of great exposure, and I should not recommend it to anyone of a marked rheumatic tendency.

"4. I think an overseer could not make use of choice seeds and bulbs until he was thoroughly established—then he might do so.

"5. I am, perhaps, 'mistaken, but suppose that no pollen would bear transportation to Guiana and still remain fertile. Of the orders mentioned, only Liliaceae and Gesneriaceae thrive in Guiana. " F. IM THURN.

"August 8, 1892."

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—At the last meeting of the above, Mr. A. HESLOP presiding, an interesting paper was read by Mr. JAS. ELLIOTT, gardener at Jesmond Dene, Newcastle, on "Insectivorous Plants, their Peculiarities and Cultivation." The essayist exhibited several specimens, and he gave good instructions as to the cultivation of these plants generally. A discussion followed, in which some of the members took part. In the course of the evening Mr. E. DIERY was presented with a prize for an essay on "Exotic Ferns." By the kind permission of Lord ARMSTRONG the members and friends of this Society will have their excursion to Cragside, Rothbury, on Tuesday, August 16.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting held on July 13, the Floral Committee awarded First-class Certificates to the following exhibits:—For *Vriesea splendens gigantea* (imported new plant), shown by Mr. C. W. R. Schulten, jun., Amsterdam; *Gladiolus brevifolius* var. *luteus* (new plant), shown by Messrs. De Graaff Brothers, Leyden; *Cheiranthus fl.-pl.* Hort. Damman, 1890 (new plant), shown by Mr. P. Henkel, at Hilversum; *Bomarea Lehmanni*, Baker (insufficiently-known plant), Canna Madame Crozy, Liliium Grayi, S. Wats. (imported new plant), and *L. maritimum*, Kell. (imported new plant), shown by Mr. C. G. van Tubergen, jun., Haarlem. Second-class Certificates were awarded to *Canna hybrida* No. 1 (new plant), shown by Mr. J. C. de Lange, Rotterdam; and *Polygonum sphaerostachyum* (insufficiently-known plant), shown by Mr. C. G. van Tubergen, jun. A Botanical Certificate to *Wurmbea divisa* (imported new plant), exhibited by Messrs. E. H. Krelage & Son, Haarlem.

EFFECTS OF EARTHQUAKES ON VEGETATION.

—So even earthquakes exercise a beneficial influence, though they are apt to be rather alarming. Signor A. GOIRAD has recently asserted that they induce a more rapid growth of the young plant, and that the result is a greatly increased luxuriance of vegetation in the pastures, arable lands, vineyards and shrubberies; and this is accompanied by an unusually deep green colour of the leaves. It is not to the undulatory vibration which accompanies seismic shocks that this beneficial result must be attributed, but rather to these secondary causes, namely (a), an increased amount of carbonic acid in the air; (b), the diffusion of nutrient fluids through the soil when acting as a kind of manuring by natural distribution; (c), the production of electricity. It may be said that some earthquakes appear to exert a bad effect upon vegetation, and instances may be quoted to support the assertion, but in all these instances it can be shown that the earthquakes have been associated with a long period of drought. Speaking of the

beneficial effects of electricity, we have yet to record the experiments by Professor A. ALOR in the early part of the year. He noted the influence of atmospheric electricity on the growth of *Lactuca scariola*, *Zea Mays*, *Triticum aestivum*, *Nicotiana tabacum*, and *Vicia Faba*, and has concluded from his observations that atmospheric electricity exercises an encouraging effect on vegetation; that the electricity of the soil has a similar influence on the germination of seeds; and that the less luxuriant vegetation of plants which grow in the neighbourhood of trees is due in great part to the diminution of temperature.

WHEN OUGHT [PLANTS TO FLOWER?]—In a German paper (the *Bot. Gazette*, xvii, 1892, p. 1), Herr A. F. FOERSTE advocates the view that the proper time for plants to flower is the late spring and the early summer. But plants like animals have in their way to struggle for existence, and in this effort two opposite tendencies have arisen, viz., (a).—To obtain advantage over surrounding plants by increasing in size, and thus receiving more air, light, and room for the development of their flowers; this tends to result in the flower being produced in late summer and early autumn. (b) To gain advantage on other plants by the earlier opening of their flowers, by blossoming before the light and air are interfered with by the development of the foliage; this is affected by the reduction of their internodes, and results in the flowers opening in the early spring. As an example of the way in which plants conduct their struggle for existence, it may be mentioned that some autumn-blooming flowers will not mature until the following spring if the conditions are unfavourable at their proper time.

PELORIA OF CATTLEYA GIGAS.—From Mr. LUCAS we have received a flower of this variety, in which the two lateral petals were developed in the form of lips, so that there were, in fact, three lips. Such flowers present close resemblance to the flat lilies like *L. Kämpferi*. A less frequent change is that in which the lip is present in the guise of a lateral petal, as we have seen it in *C. Skinneri* and others. Thus in one genus we get illustrations of the two forms of peloria—that in which the irregularity is heightened, and that on the contrary wherein it is lessened, the result in both cases being the production of a more or less regular flower instead of an irregular one.

PARASITES OF THE RASPBERRY AND APPLE.—The fungus, *Cladosporium herbarum*, which has hitherto been considered harmless, has recently been discovered to be capable of assuming a parasitic form. In this condition it affects the leaves of various plants, including the Raspberry and Apple, in the former spreading from the median to the secondary nerves, and penetrating within, and in the latter locating itself upon the edge of the leaves. There is a number on these cases of parasitism by MM. PAILLIEUX and DELACROIX in the *Bulletin Soc. Mycol. de France*, vii, p. 134. These scientists also communicate some cases of parasitism in connection with a *Botrytis* epidemic in *Gentiana lutea*.

HOME CORRESPONDENCE.

DEW: THE NEW THEORY ABOUT IT.—What has come to Professor Wollmy and the writer of the statement in the *Gardeners' Chronicle* some short time ago? As yet we have not been favoured with an answer from the Professor, nor has any correspondence arisen other than "W. P. R.'s" and Mr. Greave's;

surely the subject is not exhausted, on such an important subject to gardeners at all times and places. The theory, as stated by your correspondent, requires that more should be said about it. I shall watch for anything that appears in your valuable journal concerning the matter, which is anything but threshed out yet. *Dewdrop.*

TROUT IN GARDENS.—Some persons think it absolutely necessary to have a running stream for trout to live in, but this is not so, as we kept several in a small pool in the garden for two years, and during that time they thrived really well. The pool in question is one of three in which Water Lilies, Flags, Bullrushes, &c., are growing, and Rhododendrons, Ferns, Bamboos, climbing plants, and such-like on the margin. The pools are made of concrete; some rough gravel laid at the bottom for appearance sake as an imitation of a natural stream. The water supplying these pools is pumped up from a chalk well, 250 feet deep, into a tank, from whence it flows through iron pipes by gravitation into the top pool of the three, out of this over a miniature weir, then into a larger pool. Fresh water was run into the top pool where the trout were kept twice a week for perhaps an hour at a time, except during the winter, when fresh water was run but little once a month or more, according to the state of the weather. The trout were caught in a neighbouring stream, and carried in a water-pot for 2 miles. They were but seldom fed, and then only with worms by which they were coaxed from under large shells and stones in the pool. When the trout were put into the pool there were many small gold fish in also, but they rapidly disappeared, the trout eating them by degrees. *E. M.*

THE LIFTING AND STORING OF POTATOS.—Already (July 28) the disease has made its appearance among Potatos, and yesterday I saw a cottager busy with a hook cutting off the tops, but I advised him to stay his hand, telling him that half a leaf was better than no foliage at all, as it was not an early sort he was operating on, and the tubers, if saved by being thus denuded of the tops, would have been of no use. Had they been Myatt's, or the old Ashleaf, or any sort at all near maturity, it would be well to take them up; and this I should advise to be done in all cases where the skins are set and disease is showing itself; but the lifting should be carefully performed, and all the tubers intended for seed left on the ground for a day or two before being stored, and then laid thinly in some cool, light, airy shed, and not moved again, if it can be avoided, as the less handling the better. Late sorts will not be ready to dig for at least another month, and I am glad to report them looking remarkably well, especially Magnum Bonums. Unfortunately all varieties of Potatos are backward, and the disease, if it comes in a virulent form, will do more harm than usual; but the weather seems now to have become more settled and dry, and therefore not so favourable to the spread of the malady. It is quite my opinion that we should be much more free of it if the American sorts of Potatos were not grown, as they are always the first to show it, their soft leaves and stems perishing from the attacks of it very quickly, and communicating the disease to others near, and perhaps far away. *J. Sheppard, Suffolk.*

APPLE LORD GROSVENOR.—This is by far the best early kitchen Apple that we grow on our strong soil, the fruit being ready for kitchen use earlier than Lord Suffield, which some persons so much favour, and not without reason, it certainly being a grand fruit in light soils. I gathered some fruits of Grosvenor on July 11 that were quite large enough for use, and that exhibited none of the woody flavour which some Apples have when early gathered. Twenty-five trees planted in 1890 are now heavily laden, and yet quite as many were taken off the trees at an early period as they are now carrying. The trees, in spite of the load they bear, are making satisfactory growth. *E. M.*

TRAINED GOOSEBERRIES.—I do not know whether fruit nurserymen as a rule grow cordon Gooseberry plants, but it is satisfactory to learn that they are in considerable request, and will probably become more so in good time. I asked Messrs. Veitch & Sons' fruit foreman from Langley the other day at the Drill Hall which sorts seemed to be most favoured for cordon training, and he replied, the large Lancashire show varieties. Not that Gooseberries were grown in that way for those especially, but rather it is the case that large fruits are now much more in request than formerly for

dessert purposes, bearing out the contention of our ordinary fruit authorities that the taste of big fruits on the dessert table rather increases than diminishes. These cordon bushes, if they may be so termed, are preferred to the fine upright stems, and in that way trained to low walls or close wood fences, or, as is so admirably done at Claremont by Mr. Burrell, to specially designed stout wire fences or trellises 4 feet in height. Probably the preferable method is against walls or close fences, as the bloom is then better protected; the fruits come larger and colour better, and they are by means of nets so easily protected from depredators. In the Gooseberry we have variety in the colour of the berries as well as more or less hairiness, and much difference in flavour and size, so that, with proper variation from day to day, at least a couple of dishes of diverse sorts may be gathered daily. Gooseberries are cleaner when grown on cordons, and, being easily thinned, the berries may be grown to a larger size than on a bush. Mr. Molyneux has at Swanmore a stiff soil on the chalk, which does not promote free growth in Gooseberries, so that little pruning is needed; but the bushes fruit so abundantly that the branches seem as if incapable of carrying their crops without some support. Everyone, however, is not so favourably placed, and where Gooseberries are shy of fruiting on bushes, that is just the place to go for cordon-trained trees on walls, fences, and trellises. For high flavour, Green Gascoigne, Pitmaston Greengage, Red Ironmonger, Red Champagne, Yellow Champagne, and White Smith are of the best; whilst of large ones, Lancashire Lad, Dan's Mistake, Monarch, and Conquering Hero, reds; Candidate, Leader, and Trumpeter, yellows; Thumper, Telegraph, and Shiner, green; and Antagonist and Freedom, whites, make up a round dozen of the best and finest in variety. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 26.—Present: Mr. Morris (in the chair), Mr. McLachlan, Mr. Michael, Prof. Green, Prof. Church, and Rev. G. Henslow (Hon. Sec.); visitor, Dr. W. C. Williamson.

Termes at La Rochelle.—Mr. McLachlan having previously stated at the meeting held on June 21, that the species in question was a native of the Old World alone, though Mr. Warburton is still under the impression that it was introduced to La Rochelle from America, he added the following observations:—"Termes was first noticed at La Rochelle about 1798, and was supposed to have been introduced from St. Domingo, with which place there was much trade at that time. This erroneous idea evidently still exists at La Rochelle as a tradition, having been handed down from generation to generation. A much more probable explanation has been suggested, namely, that it was introduced into La Rochelle with firewood from Landes, where it is very abundant. Termes lucifugus has never been found in any part of North or South America, or in the West Indies. In geographical distribution it is essentially circum-Mediterranean, but extends into Spain, Portugal, and as far north as La Rochelle. I possess the insect from several localities on the European coasts of the Mediterranean, and also from Egypt and Algeria."

Dianthus Attacked by Fungus.—Mr. Masee reported upon the specimens sent to the last meeting by Rev. C. W. Dod, as follows:—"The fungus is *Helminthosporium exasperatum*, Berk. and Br., and is present in various stages of development. As to whether this fungus is the cause of the disease or not it is impossible to say without experimenting on healthy plants. This I am now doing, and will report later. I may add, that *Helminthosporium* has been shown to be the cause of disease in other cases."

Bouillie Bordelaise, Cause of its Failure.—The following communication was received from Dr. Russell:—"I send you now the result of my examination of the bouillie bordelaise used at Chiswick. Mr. Barron, I find, took 7 lb. of sulphate of copper and 10 lb. of quicklime; he slaked the lime in 10 quarts of water, and dissolved the copper sulphate in 7 quarts of water, and afterwards diluted these liquids so as to make the total quantity up to 100 quarts. The clear solution from the lime was added to the sulphate of copper solution, and the precipitate

allowed to settle. The Tomatos were syringed with the clear liquid. The effect has been disastrous, the stems and leaves having in every case been burnt, and the lower leaves had to be removed. Some of the same solution falling also on Vine leaves produced red spots (burns). Now this solution, prepared as above described, was simply a dilute solution of sulphate of copper, containing about one ounce of sulphate of copper in the gallon; so that the whole of the process for preparing the solution was entirely useless, and the product, viz., the hydrated oxide of copper thrown down by the lime, was allowed to settle and was not used; in fact, if you had taken an ounce of copper sulphate and dissolved it in a gallon of water you would have got a solution of exactly the same kind as the one which was used. In the letter from M. Cornu which you have sent me, I see it is stated that this hydrated oxide of copper is the active agent, and that the copper ought to be totally precipitated from the liquid. At the same time, I think that the nature and the preparation of this bouillie bordelaise has not generally been clearly stated and understood. I suppose I may assume that this hydrated oxide of copper is the substance which it is desired to prepare, but it will be a matter of the greatest importance as to whether it is suspended in a solution of sulphate of copper, or in lime water, or in pure water; all of which cases are possible according to the proportions of the materials used. In the case of Chiswick there was a deficiency of lime, and hence the copper sulphate remained in solution. To get rid of the sulphate of copper, which appears to have acted so injuriously, the instructions should be to continue the addition of lime till the liquid just ceased to have a blue colour when a depth of 2 or 3 inches is looked through. I should think that the different results which have been obtained by different experimenters may be to a great extent accounted for by the want of an exact description of how the bouillie bordelaise was to be made and how it should be used."

The following are extracts from M. Cornu's letter received by Dr. Masters (from the Muséum d'Histoire Naturelle, Paris):—"The proportions of the bouillie bordelaise vary from 3 to 4 kilograms of sulphate of copper, with 3 to 4 of quicklime, and 100 kilograms or litres of water [1 kil. = 2½ lb.; 100 litres = 22 gallons]. It is better to have less copper than lime, so that all of the former may be precipitated. The copper salt must first be dissolved in water (10 litres), and the lime also separately in 20 litres; the two must then be mixed together. Under these conditions the copper is reduced to the state of a hydrated oxide, which is quite or nearly insoluble, and does not burn the leaves. The lime also effects a mechanical adherence of the copper salt to the surface of the leaves. The hydrated oxide of copper becomes soluble under the influence of organic acids contained in small quantities in the liquid in contact with the vegetative organs. There is an elective property in cellulose membranes for salts of copper, and the natural explanation which follows from this fact is: first, that the *Peronospora* is killed by the salt; and secondly, that the spores cannot germinate upon leaves the membrane of which has imbibed the copper salt. Leaves which have thus received the mixture are not invaded by the *Peronospora*, while adjacent leaves are less easily attacked. It has been observed in Burgundy that the Vines were much less attacked by the *Peronospora*, the props of which had been treated with the sulphate of copper, than those not so treated. Hence it is advisable to soak all the objects which surround the plants, especially the props or supports, &c., in the bouillie bordelaise, as well as the walls, soil, pots, &c. The author finally suggests the trial of copper sulphide finely pulverised and scattered over the borders, plants, &c." With reference to this last-mentioned suggestion of M. Cornu, Professor Church observed that copper pyrites in fine powder suspended in mine water has been proved to be most injurious to young grass in water meadows. Free sulphuric acid and basic sulphate of copper and iron were produced; the acid being the chief destructive agent.

Black Rice from Burmah.—Professor Church announced his discovery of the occurrence of a red pigment in the grain of the Black Rice of Burmah. A sample of this remarkable variety of Rice was recently handed to Professor Church for chemical analysis by the Director of the Royal Gardens, Kew. It was an imperfectly decorticated sample, most of the grains still retaining portions of the dark-coloured pericarp. Plunged into slightly acidulated alcohol the pigment dissolved with a magnificent crimson colour, and proved to be identical with one

of the most widely-diffused and best known of vegetable colouring matters. This is the compound represented by the empirical formula $C_{25}H_{20}O_{10}$, and known by various names, such as *anolin*, *anthocyan*, *erythrophyll*, and *colein*. It occurs in black Grapes and black Currants, in the leaves of the Copper Beech, in the stems and leaves of *Coleus Verschaffeltii*, in the florets of the crimson Dahlia, &c. It is soluble in alcohol, but insoluble in ether, and nearly so in pure water; and may thus be distinguished from carotin, which dissolves in ether, and from amarantin, which is soluble in water, but not in alcohol. It becomes purple, then blue, and finally green, or even yellow, by the action of alkalis. Its spectrum is quite characteristic. A full account of this pigment was published in the *Journal of the Chemical Society* for March, 1877.

Figs, Diseased.—Mr. Barron sent some varieties of yellow Figs from Chiswick with dark green spots. Each spot proved to have a scale insect, *Mytilaspis ficua*, in it. The leaves were also affected, but these were neither damaged nor discoloured as was the fruit.

Verbascum, Fasciated.—Mr. Paul exhibited a fine specimen of this plant in this abnormal condition. Mr. Henslow observed that he had several very long fasciated stems of *Asparagus* this year, exceeding 6 feet in length, and from 2 to 3 inches in breadth. He also added that he had raised a fasciated *Tropæolum* by seed for six years in succession. *A propos* of hereditary malformations, Dr. Masters wrote to say that although Dr. Hugo de Vriese had succeeded in reproducing by seed the spirally twisted variety of the Teazle, yet plants raised by himself from seeds sent to him by Dr. Vries had grown quite normally.

Proliferous Mignonette.—A specimen of this monstrosity was sent by Mr. W. Treseder, of Cardiff. It proved to be the same as one issued by Mr. W. Balchin of Hassock's Gate in 1881, and called *Reseda odorata*, var. *prolifera alba*. It was described and figured by Rev. G. Henslow in the *Journal of the Linnæan Society*, vol. xix., p. 214, pl. 32. The peculiarity resides in the fact that every branch arises out of the centre of an abortive flower, and occupies the place of the pistil. Occasionally two branches arise out of the same flower. Each of the branches, especially the lower, may have lateral ones. These also in the same way rise out of the centres of similarly proliferous flowers. The plant, of course, cannot seed, but can be propagated readily by cuttings.

Vegetable Marrow, Malformed.—Mr. Henslow showed a specimen in which a lateral branch had flattened out, and was adherent to the side of a fruit some 5 inches in length. At the summit of the latter a leaf was given off, as well as another branch similarly adherent to a second fruit of about 2 inches in length. At the summit of this was also a leaf, together with a normal flower-bud. In addition to the last-mentioned youngest fruit, there was also a second growing from the apex of the first or lowermost fruit. This was about 4 inches in length, quite free, and normal in character. By the side of this was a young branch with leaves, buds, and tendrils, all undeveloped, and apparently quite normal.

The next meeting of the Scientific Committee will be held on October 4.

National Carnation and Picotee.

JULY 26.—The exhibition of the above was held in the Drill Hall, James' Street, Westminster, in conjunction with the Royal Horticultural Society's meeting on the above date.

It was said by an old Carnation grower that this was the best exhibition of Carnations ever seen in London. It was an extensive show, the flowers were large, and the bizarres and flakes in which scarlet and crimson predominated were in many cases very bright, but the ground colour of not a few was creamy, as if more time was required to bleach them out to the required purity. In a few cases the flowers were getting past their best, but only occasionally so. The Picotees lacked purity of the ground colour also, and the marginal colours were flaky, probably owing to the coldness of the present month. The yellow grounds were numerous and very good, the selfs and fancies superb. A company of young growers from Southampton did well, the southern atmosphere, and more favourable conditions of climate favoured them, and their flowers generally were of excellent quality. Miscellaneous contributions of Carnations were numerous and interesting, and those who admire the Carnation

found much that afforded a varied study of the flower.

Carnations.—In Class A. for twenty-four blooms of Carnations, not less than twelve varieties, Mr. J. Douglas, gr. to Mr. Whitbourn, Great Gearies, Ilford, was placed 1st with large and full flowers; a few somewhat rough and dull-coloured, others particularly bright and effective. He had C.B. Hooper, R.F. Thalia, P.F. C. Henwood, S.B. Eurydice, very promising, bearing a fine petal, and richly-coloured flakes; C.B. Phœbe, S.B. Robert Lord, S.F. Rob Roy, P.P.B. Sarah Payne, S.F. Mrs. C. Graham, very fine; R. F. Lady M'Currie, S.B. Robert Houlgrave, C.B. Virgil, S.F. Alisemond, C.B. William Skirving, S.B. J. Crossland, R.F. Rob Roy. A few of the foregoing were shown in duplicate, and the remainder were seedlings. 2nd, Mr. C. Turner, with rather smaller but brighter flowers generally, and undoubtedly of the finest quality. He had P.P.B. Harmony, delicate in colour; R.F. Lady Maria Currie, P.F. C. Henwood, very fine; S.F. Tom Macreath, very bright; C.B. Joseph Lakin, C.B. Rideman, C.B. H. K. Mayor, S.B. Robert Houlgrave, S.F. Henry Cannell, P.P.B. Jim's Favourite, S.B. Dr. Hogg, very fine; R.F. Mrs. Gibson, S.F. Tom Pinley, C.B. Squire Llewelyn, S.F. Charles Turner, and C.B. Harrison Weir. 3rd, Mr. Martin Rowan, Manor Street, Clapham, with flowers remarkable for their quality, regard being had to the fact they were grown so near to London. 4th, Mr. F. Hooper, Widcombe Nursery, Bath.

There were five collections of twelve blooms, and here Mr. Rowan came in 1st with a dozen flowers, generally of very fine quality, having R.F. Thalia, C.B. J. S. Hedderly, P.F. George Melville, S.B. Robert Lord, C.B. J. D. Hextall, P.F. Gordon Lewis, S.F. Alisemond, P.P.B. Sarah Payne, S.B. Alfred, S.F. Sportsman, C.B. Edward Rowan, and S.B. Robert Houlgrave. 2nd, Mr. C. Phillips, Hamilton Road, Reading, with R.F. Rob Roy, S.B. George, P.F. Gordon Lewis, S.B. Admiral Curzon, P.F. Mr. May, C.B. Harrison Weir, P.F. James Douglas, S.B. Robert Houlgrave, P.P.B. Rifleman, and S.F. Flamingo; 3rd, Mr. H. W. Headland, High Street, Leyton. There were eight collections of six blooms, and here Mr. J. J. Keen, Southampton, was 1st with some excellent flowers, remarkable for their purity and richness of marking, having P.P.B. Sarah Payne, P.F. Gordon Lewis, R.F. Lady Mary, P.P.B. William Skirving, S.B. Fred, and S.F. Matador. 2nd, Mr. Joseph Lakin, Temple Cowley, Oxford, with S.B. Alfred, P.F. James Douglas, P.P.B. William Skirving, S.F. Matador, P.P.B. Harmony, and R.F. Sybil, very fine; 3rd, Mr. F. Cattley, Bath.

Then followed what are known as the class flowers or single blooms, and the awards of the judges went as follows:—Scarlet bizarres, 1st, Mr. M. Rowan with Robert Houlgrave; 2nd, Mr. C. Turner with Dr. Hogg; 3rd, Mr. J. Douglas with seedling; 4th, Mr. J. Keen with seedling; 5th, Mr. J. Lakin with Robert Houlgrave.

Crimson bizarres.—1st, Mr. F. Hooper, with Mrs. Cattley; 2nd, Mr. R. Sydenham, with J. S. Hedderly; 3rd and 4th, Mr. C. Black, with Phœbus; 5th, Mr. H. W. Headland, with seedling.

Pink and purple bizarres.—1st, Mr. J. J. Keen, with Sarah Payne; and it was interesting to see this old flower at the head of its class after nearly fifty years' culture.

Purple flakes.—1st, Mr. C. Phillips, with James Douglas; 2nd, Mr. M. Rowan; and 3rd, Mr. F. Nott—both with George Melville; 5th, Mr. J. Douglas, with Simooite's Mrs. Douglas, having a fine depth of purple.

Scarlet flakes.—1st, Mr. J. Douglas, with Matador; 2nd, Mr. R. Sydenham, with Henry Cannell; 3rd and 4th, Mr. M. Rowan, with Sportsman; 5th, Mr. J. Douglas, with Alisemond.

Rose flakes.—1st, Mr. W. J. Lakin, with Sybil; 2nd, Mr. C. Turner, with Lady M. Currie; 3rd, Mr. F. Hooper, with Mr. G. Codling; 4th and 5th, Mr. C. Blick, with Thalia.

The premier Carnation, selected from the entire exhibition, was S.B. Dr. Hogg, shown by Mr. C. Turner, a richly-coloured flower of fine quality.

Picotees.—There were five stands of twenty-four blooms, in not less than twelve varieties, and here, as in the case of the Carnations, size rather than finish appeared to be favoured by the judges. Mr. J. Douglas was placed 1st with L. rose E. Favourite, L.P.E. Her Majesty, L. red E. Violet Douglas, H. red E. Brunette, L. rose E. Miss Flowdy, H. rose E. Lady Holmesdale, L.P.E. Ann Lord, H. rose E. Mrs. Sharp, L. red E. Mrs. Bower, and seedlings; 2nd, Mr. Charles Turner, with smaller flowers, but very

pure, and of fine quality generally, having H. red E. Adolphus, H. rose E. Mrs. Harford, L. rose E. Favourite, L. rose E. Lady Emily Van de Weyer, H. rose E. Mrs. Rudd, H. red E. Brunette, L.P.E. Lady Gordon Cathcart, H. red E. J. T. S. Geggie, L.P.E. Miss B. Coutts, Medium P.E. Zerlina, H.P.E. Muriel, H. red E. Morna, L.P.E. Esther, H.P.E. Mrs. Chancellor, L. red E. Thomas William, and H. red E. J. B. Bryant; 3rd, Mr. M. Rowan.

With twelve blooms, Mr. C. Phillips was 1st out of seven stands, having excellent blooms of L.P.E. Jessie, H.P.E. Zerlina, L. rose E. Orlando, H.P.E. Muriel, H. red E. Brunette, L. rose E. Mrs. Ricardo, H. red E. J. B. Bryant, L.P.E. Lady Curzon, H. red E. Morna, H. rose E. Mrs. Sharp, L. red E. Mrs. Gorton, and H.P.E. Tinnie; 2nd, Mr. H. W. Headland, with L.P.E. Pride of Leyton, a flower of excellent quality; H. red E. J. B. Bryant, L.P.E. Clara Penon, L. red E. Souvenir of H. Headland, L. rose E. Favourite, H. rose E. Lady Holmesdale, H. red E. Dr. Epps, H. rose E. Mrs. Sharp, and seedlings; 3rd, Mr. M. Rowan.

There were eight competitors with six blooms, Mr. J. J. Keen being placed 1st with H. rose E. Norman Carr, L. rose E. Favourite, L. rose E. Ethel, H. red E. Isabel Lakin, H. rose E. Madeline, L.P.E. Clara Penon; 2nd, Mr. J. Lakin with L. rose E. Favourite, medium P.E. Amelia, L.P.E. Juliette, H. rose E. Norman Carr, H. red E. Isabel Lakin, and H. rose E. Elise; 3rd, Mr. J. Rebbeck, Southampton.

There were four collections of twelve yellow grounds, Mr. C. Turner running Mr. Douglas very close indeed for 1st place. The latter had Aurora, Mrs. R. Sydenham, Remembrance, Lillian, Mrs. Henwood, and Seedlings of much promise. 2nd, Mr. C. Turner, with Mrs. Henwood, Edith, M. Wynne, Mrs. Walford, Countess of Jersey, Almira, Consolation, Canariensis, Remembrance, and Optimus, a few of the foregoing being shown in duplicate. 3rd, Mr. C. Phillips, who had very good blooms of Annie Douglas, Dorothy, Prince of Orange, and Victory; and, as showing the popularity of the yellow ground varieties, there were ten collections of six blooms. Mr. F. Hooper was placed 1st, with Countess of Jersey, Mrs. F. Baker, Mrs. Wood, and three fine seedlings. 2nd, Mr. F. Nutt, with Almira, Duchess of Teck, Annie Douglas, Terra Cotta, Agnes Chambers, and Stadraith Bail. 3rd, Mr. J. J. Keen.

Single Blooms.—In these, as in the case of the classes for Carnations, a large number of flowers were staged. Heavy red edges: 1st and 2nd, Mr. J. Douglas, with Seedling; 3rd, Mr. J. Lakin, with Isabel Lakin; 4th, Mr. C. Turner, with Dr. Epps, and 5th, with Brunette. Light red edge: 1st and 3rd, Mr. C. Turner, with Thomas William; 2nd, Mr. H. W. Headland, with Souvenir of H. Headland; 4th, Mr. Rowan, with Mrs. Gorton; 5th, Mr. C. Phillips, with Thomas William. Heavy purple edges: 1st, Mr. J. Douglas, with Muriel; 2nd, Mr. Keen, with Amy Robsart; 3rd, Mr. C. Turner, with Zerlina; 4th, Mr. M. Rowan, with Calypso; 5th, Mr. F. Nutt, with Becky Sharp. Light purple edges: 1st, Mr. H. W. Headland, with Pride of Leyton, and 4th, with the same; 2nd, Mr. J. Lakin, with Miss Lakin; 3rd, Mr. C. Turner, with Mary; 5th, Mr. J. Douglas, with Ann Lord. Heavy rose edge: 1st and 3rd, Mr. J. Keen, with Mrs. Sharpe; 2nd and 5th, Mr. Nutt, with the same; Mr. H. Startup was 4th, with a Seedling. Light rose edge: Mr. J. Douglas was 1st and 4th; Mr. H. W. Headland, 2nd; and Mr. J. Keen, 3rd and 5th, all with Liddington's Favourite. Yellow ground: 1st, Mr. C. Turner, with Countess of Jersey; 2nd, Mr. J. Douglas, with Mrs. Henwood; 3rd, no name, with a Seedling; 4th, Mr. Nutt, with Almira, and 5th, with Agnes Chambers. The selfs and fancies were strikingly fine, generally large full flowers, many of them brilliantly coloured. The best twenty-four blooms were shown by Mr. C. Turner, who had fine examples of Lady Mary Currie, a fine pink self sport; Germania; Rose Unique, a very fine self; Victory, yellow ground; Marnie Murray, a glorious reddish-rose self; Niphetos, white self; Iona Ruby, ruby-pink, very fine; Mrs. Ford, white; Lord Rendlesham, Mrs. R. Hole, King of Scarlets, bright scarlet; Romulus, which had run to a pale buff self; The Governor; Rose Thynne, a fine maroon self; Victory and Gwendoline. 2nd, Mr. J. Douglas, with Mrs. Walford, yellow ground; Lily Henwood Germania, Victory, Niphetos, Mrs. Reynolds Hole and seedlings; Mr. Douglas, like Mr. Turner, having several of the named varieties in duplicate; 3rd, Mr. C. Blick, gr. to Mr. R. Smith, Esq., Hayes Common, Kent, who had a very fine Eudoxia, a deep pink self; Germania,

very fine; Mrs. George, rosy pink, very fine; and Florizel, maroon; 4th, Mr. M. Rowan. Eight stands of these were exhibited.

There were thirteen stands of twelve blooms dissimilar, and here Mr. J. J. Keen was placed 1st with A. W. Jones, Y.G.; Mrs. Kingscote, edged with pink; Gladys, Lord Rendlesham, Hebe, Victory, Mrs. Harcourt, Mrs. Fred. Vandyke and seedlings; 2nd, Mr. F. Nutt with admirable blooms also of Rose Celestial, Almira, Exile, Stadraith Bail, Theodore, very fine; Mrs. Fred. Vandyke, bright slate colour, flaked with carmine; Annie Lakin, Terra Cotta, Budge, pink; and Germania; 3rd, Mr. C. Blick; 4th, Mr. C. Phillips.

As usual there was a class for a dozen blooms of Carnations in pots, the object being to develop excellence as decorative subjects; but in this direction we do not appear to have made any substantial advancement during the last thirty or forty years. Plants were then grown and bloomed in pots as they are now, and quite as well. The great advance has been made with the Malmaison type of Carnation, of that there can be no doubt; and as they are now grown, they are valuable decorative plants. The best lot came from Mr. Turner, who had Irma, white self; Harmony, P.F.; Romulus, Y.G.; C. Glenwood, P.F.; King of Scarlets, self; Duchess of Sutherland, R.E.P.; Ruby, self; L.R.E. Favorite, Mrs. Clements, Y.G.; Victory, Y.G.; Mrs. Nicholas, L.P.E. &c. 2nd, Mr. J. Douglas, who had Niphetos, white self; Lady Gwendoline, self; Mr. Walford, Y.G.; Mrs. R. Sydenham, Y.G.; Eurydice, Y.G.; Thalia, R.F., &c. Two or three other collections are shown, but the plants are hardly seen to the best advantage standing along the middle of a table.

The competition for Mr. Martin Smith's prizes brought a fair number of varieties of what are assumed to be improved border varieties. In the class for a bunch of self-coloured, of not less than twelve trusses, Mr. J. Douglas was 1st, with Oriflamme, a bright scarlet self, of good petal, free and early; but the flowers were unequal, some being thin and rough, although they were showy. Mr. T. Lodge, Willingham, Cambs, was 2nd, with a pure white self, well-shaped, and having a good petal; it is as yet unnamed. 3rd, Mr. Jones, Kensington, with Pink Perfection, a bright rosy-pink self, and a good grower. Mr. F. Hooper showed a deep purple self, shaded with maroon; Mr. Bones, Tower House, Chiswick, a large finely-formed white self, fifteen flowers being shown, all from one plant; and Mr. G. H. Sage, Ham, showed a salmon-pink self.

In the class for six varieties of self-coloured border Carnations, Mr. F. Hooper was placed 1st, with Queen of Purples; Lady Constance, pink; Gaiety, pale scarlet; Gluck, shaded crimson; Lady Cavendish, deep purple; and an unnamed variety. Mr. J. Douglas was 2nd, with some blooms that were unnamed. Mr. A. Harrington, Shrubland Park Gardens, Ipswich, 3rd, with some rather large French varieties.

In the class for nine bunches, flaked bizarre or fancy varieties, Mr. F. Hooper was 1st, with Bertha, Y.G.; Abiah, S.F.; Clipper, yellow, flaked red; Mrs. W. Dean, light rose-edged Picotee; and some unnamed varieties; 2nd, Mr. J. Douglas, with unnamed varieties.

Seedlings.—Prizes were offered for seedlings, but it was very difficult to gather up anything like a reliable account of those awarded. First prizes were awarded to Mr. J. Douglas for Homer, C.B. Carnation, very rich in colour, and fine in petal, large and full; Atrato, P.F., finely flaked, with a deep bright blue-purple, fine in petal; Ganymede, II. red E. Picotee, of good promise; Melpomene, medium rose E. Picotee, pure and good; Desdemona, light rose E. Picotee, the colour pink-rose, and very pleasing; Eurydice, a very fine Y.G., of good colour; and Zeno, medium red E. Picotee. As far as could be learned, no other exhibitor received prizes for seedlings.

First-class Certificates of Merit were awarded to Homer, Melpomene, Zeno, and Eurydice. The same award was made to Mr. William Badcock, Oxford Road, Reading, for a large, full, and fine-petalled white self, named Lady Wantage, that promises to take a high position.

Among miscellaneous contributions, Messrs. James Veitch & Sons, Royal Exotic Nurseries, King's Road, Chelsea, had a large and interesting collection, set up in bunches of three blooms, each backed with their own foliage. Among the self flowers the following were very good:—Beauty of Foxhall, purple; Dr. Parke, pink; Queen of Bedders, rosy-crimson; Lady Gerrard, bright pink; Earl of Beaconsfield, crimson, flaked with black; Dorothy, buff and reddish-pink; Mrs.

F. Gifford, pure white; Magnum Bonum, crimson; Amy Herbert, rosy-pink; Rose Celestial, soft rosy-pink; and several others equally fine. Mr. F. Gifford, nurseryman, Tottenham, had a few seedling Cloves of great merit, because of their fine fragrance: such as Camlet, bright scarlet, large, full, brilliant, very sweet; Oxonian, deep crimson-maroon, highly fragrant; Maggie Laurie, soft pink; Montague, bright red; and Mrs. F. Gifford, white. Messrs. J. Laing & Sons, Stanstead Park Nursery, Forest Hill, had Carnations and Picotees in bunches. Mr. H. G. Smyth, Drury Lane, Jim Smyth, a deep scarlet Clove. Mr. C. Blick, gr. to Martin R. Smith, Esq., Hayes, had a large and extremely interesting collection, certificates being awarded to Marnie Murray, a pale pinkish-rose self, with a very fine petal; Miss Constance, a bright S.F.; Aline Newman, a pale scarlet self; The Pasha, something in the way of Mrs. Reynolds fole, but brighter and paler in colour, a fine flower, large and handsome; and Mrs. Harris, R.F. From Mr. W. Burton, gr. to Mr. C. Jones, Tonbridge, came several blooms of a very good white self, named Beauty of Tonbridge, said to make a very good border variety.

Awards of Merit.

To Carnation Horace Skimpole, Martin R. Smith, Esq.
 " The Pasha, Martin R. Smith, Esq.
 " Miss Constance Graham, Martin R. Smith, Esq.
 " Marnie Murray, Martin R. Smith, Esq.
 " Oriflamme, Mr. Jas. Douglas.
 " Lady Wantage, Mr. Badcock.

MEDALS.

Silver-Gilt Flora.

For Carnations, &c., Messrs. Veitch & Sons.

Silver-Gilt Banksian.

For a group of Carnations, Martin R. Smith, Esq.

PORTSMOUTH HORTICULTURAL SHOW.

JULY 13.—We are informed that the net gains on this show, which was held in the Victoria Park, Portsmouth, on the above and two following days, will be dispensed amongst the local charities.

The show was a good one, and the best prizes fell to gardeners in Sussex and Hampshire. Mr. Offer, of Haulcross Park, Crawley, taking the highest for twelve plants, half-flowering, half-foliage; and for Crotons, single flowering specimen plant, and specimen Ferns.

Mr. Wills, florist, Winchester Road, Shirley, was 1st for Begonias, and a group of mixed plants; whilst Mr. Hatch, gr. at Victoria Park, took premier prizes in Gloxinias and Fuchsias.

Fruit made a fine display, Mr. Inglefield, Sir J. Kelk's gardener at Tedworth, was a long way 1st for the collection of fruits.

The best black Grapes were those shown by Mr. Taverner, gr. to Sir A. K. Macdonald, Woolmer, and Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, the latter also won in the any variety class, with superb bunches of Buckland Sweetwater.

Vegetables were good for the season, and Lady Guest's gardener, Mr. Wilkins, Inwood House, Dorset, took the 1st prize for a collection of nine kinds.

HIGHGATE HORTICULTURAL.

JULY 21.—A very nice show of horticultural productions by gardeners, cottagers, and nurserymen was held in the grounds of the Priory, Highgate.

Groups.—Here a novelty in this class was seen in groups to consist of plants in flower only. The result was variety certainly, and plenty of colour, but not much of taste. Mr. Brooks, gr. to W. Reynolds, Esq., J.P., Highgate, had the best of the two arranged, having Fuchsias, a good plant of *Bougainvillea glabra*, several of *Hydrangea paniculata*, *Franciscea*, *Gloxinias*, *Petunias*, &c. Mr. H. Eason, gr. to B. Noakes, Esq., Highgate, was 2nd, Fuchsias very largely predominating, and *Clerodendron Balfourianum*.

In the class for ordinary decorative groups, Mr. Tubbs, gr. to H. Begnart, Esq., Highgate Lodge, was 1st, having in his some well-flowered white lancifolium Lilies. Stove and greenhouse plants: Mr. Eason was the chief exhibitor of these, having nine plants in bloom, a good *Clerodendron Balfourianum*, but the other plants were weak. The same exhibitor also had the best six foliage plants, including a good *Asparagus plumosus*, *Anthurium crystallinum*, *Kentia Belmoreana*, &c. This group also took the *Gardener's Magazine* Silver Medal.

The best specimen flowering plant was a fine *Ixora Williamsii*, and the best foliage plant a huge *Latania*

berbonica from Mr. Brooks. There were other classes for smaller plants, but they have no public interest.

Begonias were plentiful; Mr. H. G. Russell, gr. to H. Mansfield, Esq., Highgate, had the 1st prize for half dozen in one class; and Mr. Eason better, because dwarfier and more compact grown plants in another. A big class for twelve Begonias and twelve Gloxinias brought many rather small and none too meritorious plants; Mr. Eason having the best.

In a class for six Gloxinias some fair plants were placed 1st, from Mr. Eason, and the 2nd from Mr. Wilkinson, gr. to F. Lowe, Esq., Crouch End. One lot of four Orchids were shown by Mr. Eason—*Cypripedium barbatum giganteum* and *Sedeni*; *Miltonia vexillaria*, and *Odontoglossum Pescatorei*.

Zonal Pelargoniums were fairly good, the best bloomed plants, but very stiffly flat-trained, coming from Mr. Eason, and Mr. Russell, who was placed 2nd, had free-grown stout plants, that should bloom finely later. *Petunias* formed a very strong class, the best flowered came from Mr. Brooks, and were placed 1st, but the best grown plants, yet only partially flowered, and all doubles, came from Mr. Russell. Fuchsias were numerous, Mr. Webber, gr. to H. Smith, Esq., Muswell Hill, having the best four in medium-sized well bloomed pyramids, but the only six staged were poor thin plants. Mr. Eason had the best six Ferns, including a huge *Davallia Mooreana* and several *Adiantums*. Mr. Tubbs had the best six *Caladiums*, including well-coloured plants of *Madame Heine*, *Varus*, and *Prince Albert Edward*. The best six *Coleus* came from Mr. Brooks—good pyramidal plants.

Cut Flowers.—Roses were moderately shown. Mr. W. Taylor, Hampton, set up some nice fresh blooms, but not for competition; and the box having the best twelve blooms had no card attached. The best twelve bunches of cut flowers came from Mr. Brooks, and Mr. Page, gr. to F. Crisp, Esq., Southgate, was 2nd. The latter exhibitor staged the best twelve bunches of Begonias, set up very tastefully with Maidenhair Fern, and presented one of the prettiest arrangements in a cut flower class we have seen. Mr. Eason had the best twelve bunches of zonal Pelargoniums.

Table decorations were limited, the best three ordinary stands or epergnes being dressed with white Iceland Poppies, yellow flowers of *Eschscholtzia*, grasses, Ferns, &c. Hardy flowers in bunches were numerous shown.

Fruit.—Mr. H. A. Page was the only exhibitor in the class for white Grapes, having a capital Foster's Seedling, also the best three black Grapes in good Madresfield Court. He was also placed 1st in the class for six dishes of fruit, having good Foster's Seedling Grapes, Melon, Dr. Hoag Strawberry, Cherries, Raspberries, &c. Mr. Brooks was 2nd. Mr. Page was also 1st with eighteen dishes of bush and other hardy fruits, a good variety. Mr. Russell coming 2nd, largely with Gooseberries.

In *Vegetables*, Mr. Page had the best collection, Mr. Brooks being 2nd. The latter had the best dish of Tomatoes—a good sample; and Mr. Page the best three dishes of Peas, in Telephone, Duke of Albany, and Telegraph; Mr. Gregory coming 2nd, with the same varieties.

Various collections of ornamental plants from the neighbouring nurseries at Holloway and Highgate gave some additional interest to the show.

AYLESBURY FLORAL AND HORTICULTURAL.

JULY 21.—The exhibits were staged in the Corn Exchange, and the lower or Butcher's Market, which, if not thought suitable by the aesthetic, yet answered admirably, being cool and convenient. In the Corn Exchange, the groups and specimen plants and Ferns were arranged on the floor around the outside of the Hall, while the cut flowers, fruit, and some of the smaller plants were staged on tables extending the length of the building.

Of the groups, those not competing were far away the best, notably the grand exhibit of Baron F. de Rothschild, M.P., where it was pleasant to mark a deviation from the common manner in finish—two curved lines to right and left, the space between the two projections being filled with a glorious group of plants of Malmaison Carnations, in the three colours, full of health, and carrying some grand flowers, the background formed of fine Palms, Crotons, &c., with a well-flowered *Clerodendron Balfourianum* in the point of sight, while the foreground was broken and relieved by some *Saxifraga pyramidalis* placed at intervals among the small Palms, *Adiantums*, and finely-coloured *Caladiums*.

Mr. Leopold de Rothschild also sent from Ascot a fine group of Carnations, nearly 100 plants, showing evidence of the best culture.

The fruits, with the exception of the Grapes, and a very well-done collection by Mr. Robbins, gr. to Colonel E. D. Lee, which took the premier award, were hardly up to mediocrity. Lady R. de Rothschild took 1st prize for a collection of plants, and also the Silver Medal of the *Gardeners' Magazine* for high cultural skill; Earl Temple being a very close 2nd, with somewhat smaller plants.

Ferns were well exhibited, there being a doubt in the minds of the judges whether the six Ferns exhibited by Mr. H. Cazenove, which took 1st prize, were not entitled to the Silver Medal awarded to Earl Temple.

The cottagers and amateurs staged some very creditable exhibits both in the cut flowers, plants, and fruit. Roses, having suffered from the wet and wind, were not a strong feature, but thirty-six, which took the 1st prize in the open class, and shown by Mr. Mattock, of Headington, were very creditable.

Vegetables were in quantity and quality generally good, Peas only deserving a special note. The cottager, under ample encouragement from Miss Ada Rothschild, Mr. H. Wyatt, and Mr. W. Hazell, put some very good vegetables in collections, and some baskets of salading which were good in quality and variety.

NATIONAL CHRYSANTHEMUM.

JULY 22.—For a few years past the members of this Society have had an annual outing or picnic, generally to some place of horticultural interest, and on this occasion it took the form of a visit to Penshurst Place, Penshurst, the Kentish seat of Lord D'Alsie. This took place on the above date, a large party journeying from Charing Cross and London Bridge. Penshurst was reached soon after eleven o'clock, and the company proceeded to Redleaf, the residence of F. E. Hills, Esq., who had kindly given permission for the company to pass through Redleaf on their way to Penshurst. Redleaf has long been famous for its beauty and high culture; and the late Mr. John Cox has a worthy successor in Mr. W. Holah, who was for a considerable time foreman at Redleaf. Mr. Holah met the party at the entrance, and conducted them through the grounds, which are beautifully undulating, rich in fine trees and choice evergreen and deciduous shrubs, some magnificent Conifers being greatly admired. The conservatory adjoining the residence, with its effective fernery and crystal fountain, the plant-houses and flower gardens, were visited, also the forcing-houses and fruit-gardens, and many points of interest were inspected, to the great delight of the party. Leaving Redleaf, by Mr. Holah's residence, access was gained to Penshurst Place Park, which is of great extent, finely wooded and rich in noble timber trees, Oak, Elm, Beech, &c., with acres of luxuriant Fern.

HAYWARD'S HEATH HORTICULTURAL.

JULY 27.—The show at Hayward's Heath was, as usual, very well attended, but the competition was not quite up to the usual standard. There are few shows where a larger number of the trade growers offer special prizes than at that of the Hayward's Heath Society.

The classes were very numerous. The chief of these was a group of plants staged for effect, not to exceed 50 square feet. The 1st prize was £3, and the Silver Medal of the Royal Horticultural Society. This was won by Mr. S. Horscroft, gr. to Mr. Potter, Chidingly; the 2nd prize and Bronze Medal went to Mr. J. Sands, gr. to T. Bannister, Esq., Hayward's Heath. These groups were well and tastefully arranged.

In the class for groups of Ferns and Foliage Plants, Mr. A. Scott, gr. to Mrs. Jenkins, Burgess Hill, was 1st; Mr. J. Wickham, gr. to J. Humphrey, Esq., Keymer, 2nd.

Messrs. Wood & Son, Maresfield, Sussex, exhibited some good examples of Roses—Mrs. J. Laing, Madame Falcot, L'Idéale (good), P. Wilder, Merveille de Lyon, Earl of Dufferin, and many others. This firm also put up some good Carnations and Picotees. Among other trade exhibits, not for competition, Messrs. Knight of Hailsham showed some first-class Roses; so also did Messrs. Woollard of Cocksbridge, Lewes.

Messrs. J. Cheal & Son, Crawley, had cut Roses, and a stand of charming Violas; also cut flowers of Begonias, both double and single. Several herbaceous

subjects were put up in good form, the best being Pentstemons, Aconitums, Delphiniums, and Enothera Youngii.

Messrs. J. Peed & Son, Norwood, occupied one end of a tent with a very pretty group of Dracenas, Crotons, Palms, Acalyphas, Gloxinias, &c. The group shown by Mr. Ellis Turner, of Hayward Heath, was decidedly the best in the show. Ornamental Begonias, Coleus, Ferns, &c., with a cross of lichen-moss, having a few Maréchal Niel Roses, with berries of Barberry japonica for centre, was much admired.

Vegetables are always shown in strong numbers and good quality at this show, and were better than ever this season. It may be described as a very successful gathering, and the whole of the exhibits were of good quality.

SCOTLAND.

NOTES FROM WOODBANK, DUMFRIES.

ON a former occasion, June 12, 1886, we gave a general account of this interesting place, the residence of Charles Scott, Esq. At that time the absorbing feature was the splendid collection of Orchids, Indian Azaleas, and stove and greenhouse plants. On making a recent visit, we found that the grand specimens of Orchids had been disposed of, in order to make room for other subjects of interest to Mr. Scott, whose horticultural taste is of the catholic order. Orchids are still fostered to a large extent, Odontoglossums in particular being numerous, and remarkably well done. The young growths of these showed splendid vigour, although on several occasions last winter, the whole stock, consisting of many hundreds, were, owing to a defect in the heating-apparatus, frozen hard to the stage on which they stood. This was cool treatment with a vengeance, but the plants seemed to have enjoyed it, for they were perfect examples of successful culture. Some capital varieties of *O. Pescatorei* and *O. Alexandrae* were in bloom. Cattleyas, Lulias, Phalaenopsis, and Cypripediums are yet plentiful, but younger and smaller specimens occupy the place of the splendid examples that formerly filled the houses to overflowing.

But, regarded either as a charming floral treat, or a masterly display of cultural skill, a collection of Carnations, comprising about 1000 plants, which occupied a fine span-roofed house, 60 feet x 21 feet, was perhaps the most striking testimony to Mr. Geo. H. Cole's all-round abilities in this thoroughly well-managed place. The chief feature of the collection was the Malmaison varieties, all of which, including Lady Middleton, were there represented by perfect specimens, laden with their lovely flowers. Other notable varieties were Germania, Prince of Orange, Princess of Orange, Duchess of Fife, Duke of Clarence, Raby, and Mrs. Reynolds Hole, with many others of sterling merit.

In a rapid survey of the other houses, superb Crotons, unsurpassable in their perfect colouring; Nepenthes, Dipladenias, Ixoras, and Gardenias, were all notable for their fine condition; and not to be out of the fashion, Mr. Cole is quite at home in Chrysanthemum culture, as was attested by some hundreds of plants of the leading autumn and winter varieties in suitable quarters out-doors; and many of the early-flowering sorts, such as Madame Desgranges white and yellow, and Mrs. Hawkins, blooming handsomely in the conservatory.

Every pot-plant here is grown in glazed pots—Orchids, Heaths, Azaleas, Chrysanthemums—and, as with Mr. Thomson at Drumlanrig (the apostle of this practice), results speak volumes for their suitability for plant-culture, and for their wholesome and attractive cleanliness.

SCOTTISH BEE-KEEPERS' ASSOCIATION.

The second summer show of this Association was held within the showyard of the Highland Society's show at Inverness, on July 26, 27, 28, and 29. Though the season was very backward and stormy, there was a good display of honey, the most of the honey staged, as on the occasion of the Association's last show at Dundee, being the produce of the Eng-

lish honey-raisers. The supply of heather honey was very limited, and was of the last year's production, the honey for this season not yet being ready. In hives and appliances the most creditable show was made by Scottish manufacturers, the distance being too great for the English makers to be attracted.

The Association claims that the importance of this industry can scarcely be over-rated, when it is borne in mind that during the last two seasons the value of the imports amounted each year to the large sum of £50,000, the whole of which, if sufficient bees were kept, might have been kept in this country. A gigantic model bee, which can be taken to pieces, was also exhibited, and altogether the exhibition was one that proved of great interest to visitors.

THE BULB GARDEN.

NARCISSUS BERNARDI x.

UNDER this name we designate the natural or wild hybrids between *N. Pseudo-Narcissus* and *N. poeticus*. Of these, I selected about a hundred on the Pic d'Entecade in 1886, where *N. Pseudo-Narcissus* of the varieties known as *N. muticus* and *N. variformis* grow in abundance, mixed with *N. poeticus*, flowering at the same time. These hybrids represent in a crude form all the hybrid varieties known as Leedsii, Barri, Nelsoni, Burbidgei, and so on; but mostly want the finish of the selected garden forms of hybrid. I was surprised to find in 1887 that the collected Bernardis were producing seed in abundance, because generally true hybrids in *Narcissus* produce seed sparingly or not at all, and I suspected that they had been again fertilised by *N. poeticus*, which flowered in my garden simultaneously near them, all the trumpet Daffodils being over. From this seed I have raised several hundred seedlings, and about half-a-dozen flowered this year. So far they are of a different type from their parents, and belong to the short-crowned variety known as Burbidgei, confirming my suspicion that they are crossed in another degree with *N. poeticus*. I sent the flowers to Mr. Egleheart, who knows more about these crosses than many of us. *C. Wolley Dod, Elge Hall.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

POTATOS.

NEW POTATOS.—Kidneys, 90s. to 100s.; Beauty of Hebrons, 65s. to 75s.; Rounds, 60s. to 65s. Market firmer.
OLD POTATOS.—Finished. *J. B. Thomas.*

SEEDS.

LONDON: Aug. 3.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report that to-day's market presented quite a holiday appearance, with but few transactions passing. *Trifolium incarnatum* keeps firm; France seems to have very little seed to spare, and a good English demand is shortly expected. There is no change this week in either Mustard or Rape seed. Canary seed exhibits great and continued strength. For Hemp and Linseed the inquiry is slack. Blue Peas are firmly held. Other articles at this quiet season offer no subject for remark.

FRUITS AND VEGETABLES.

BOROUGH: Aug. 2.—Quotations:—Cabbages, 5s. to 6s. per tally; Peas, 3s. 6d. to 4s. per bushel; new Carrots, 3s. 6d. to 4s.; Turnips, 2s. 6d. to 3s.; Parsley, 2s.; Spring Onions, 4s. to 6s. per dozen bunches; Egyptian do., 5s. 6d. to 6s. per cwt.; English Apples, 3s. per bushel.

SPIALFIELDS: Aug. 2.—Quotations:—English Apples, 4s. to 6s. per bushel; foreign Tomatos, 1s. to 1s. 3d. per box; Gooseberries, 2s. 6d. to 3s. 6d.; black Currants, 4s. 6d. to 5s.; red do., 3s. 6d. to 4s.; black Cherries, 3s. to 4s. 6d.; Orleans Plums, 6s. to 7s.; Walnuts, English pickling, 2s. to 2s. 6d. per half-sieve; Seakale, 9d. to 1s. per punnet; Cabbages, 3s. 9d. to 7s. per tally; Turnips, 2s. to 3s. 6d.; Carrots, 2s. to 3s.; Spring Onions, 3s. to 4s. 6d.; Parsley, 1s. to 1s. 6d. per doz. bunches; Cauliflowers, 1s. 6d. to 2s. 6d.; Endive, 6d. to 9d.; Cabbage Lettuce, 2d. to 4d.; Leeks, 2s. to 2s. 6d.; frame Cucumbers, 1s. 6d. to 2s. 6d.; natural do., 6d. to 9d.; Beetroot, 3d. to 5d. per dozen; French Beans, 4s. to 4s. 9d.; Scarlet do., 5s. to 6s.; Broad do., 1s. 6d. to 2s. 6d. per sieve; Peas, 5s. 6d. to 7s. per sack; Cos Lettuce, 4d. to 6d. per score; Mustard and Cress, 1s. 6d. to 2s. per dozen baskets; Horse-radish, 1s. to 1s. 1d. per bundle; Mint, 1s. to 1s. 6d. per dozen bundles.

STRATFORD: Aug. 2.—The supply to the market during the past week has been plentiful, and a brisk trade was done at the following prices:—Cabbages, 4s. to 6s. per tally; Turnips,

1s. to 2s. 6d. per dozen bunches; Mangels, 20s. to 26s. per ton; Onions, Egyptian, 60s. to 80s. per ton; Port Onions, 6s. to 7s. per case; Apples, English, 6s. to 7s. per bushel; Tasmanian, 4s. 6d. to 7s. 6d. per box; Peas, 2s. to 3s. per sieve; do., 5s. to 6s. 6d. per bag; Cucumbers, frame, 1s. 6d. to 3s. 6d. per dozen; do., Dutch, 1s. to 2s. do.; black Currants, 4s. to 5s. 6d. per half-sieve; red do., 3s. to 3s. 6d. do.; bunch Onions, 2s. to 3s. per dozen; bunch Carrots, 2s. to 2s. 6d. do.; Scarlet Beans, 2s. 6d. per sieve; French do., 2s. 6d. do.; Broad do., 3s. to 3s. 6d. per bag.

FARRINGTON: Aug. 4.—Quotations:—Tomatos, 1s. 3d. per box; Cherries, white, 5s. per basket of 24 lb.; do., black, 5s. 6d. do.; Currants, black, 5s. 6d. per half-bushel; do., red, 4s. do.; Plums, Gages, 3s. 6d. per 14 lb.; Orleans do., 4s. per 16 lb.

POTATOS.

BOROUGH: Aug. 2.—Quotations:—St. Malos, 3s.; Jerseys, 4s. per cwt.; Early Rose, 60s.; Hebrons, 60s. to 65s.; Snowdrops, 70s. to 80s. per ton.

SPIALFIELDS: Aug. 2.—Quotations:—New: English:—Myatt's Kidneys, 65s. to 75s.; Regents, 70s. to 80s.; Imperators, 70s. to 85s.; Hebrons, 75s. to 85s.; Early Rose, 70s. to 75s. per ton.

GENERAL AVERAGE: August 3.—New: English Snowdrops, 80s. to 90s.; Kidneys and Hebrons, 60s. to 80s.; White Beauties, 60s. to 80s.; Early Rose, 60s. to 70s. per ton; French, new, about 3s., and Jerseys, 4s. per cwt.

STRATFORD: August 2.—Quotations:—Snowdrops, 70s. to 90s.; Myatts, 60s. to 80s.; White Elephants, 60s. to 75s.; Hebrons, 60s. to 80s.; Regents, 60s. to 70s. per ton.

FARRINGTON: August 4.—Quotations:—Best Beauties, 8s. to 85s.; White do., 75s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure, for the week ending July 30, and for the corresponding period last year:—1892: Wheat, 29s. 5d.; Barley, 21s. 1d.; Oats, 21s. 6d. 1891: Wheat, 38s. 9d.; Barley, 26s. 6d.; Oats, 21s. 5d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 80s. to 108s.; do., inferior, 46s. to 78s.; Hay, best, 60s. to 108s.; do., inferior, 26s. to 50s.; and Straw, 20s. to 38s. per load.

NOTICES TO CORRESPONDENTS.

** PHOTOGRAPHS, DRAWINGS, OR SPECIMENS.—We shall be pleased to receive from our Correspondents notes relating to interesting Gardens, together with Specimens or Illustrations of interesting Plants. Although circumstances prevent us in all cases from reproducing them, we are nevertheless glad to receive them, and as far as possible to utilize them for the benefit of our readers.

APPLE TREE: *G. W.* Wait till the leaves change colour—you need not delay operations till they fall—then take out a trench 2 feet deep about as far from the stem as the branches extend, and carefully dig out the roots, working the soil into the trench, and throwing it out at the side. When a good armful of roots are got out, wrap them in wet straw, and proceed further, and when all the roots are got out of the soil, plant the tree in a previously-prepared station, using good loamy soil about the roots, filling in a little at a time, making it firm about every bit of root as you go on. If the soil is very dry, a good watering should be afforded when the hole is half-filled, and again at the finish. Finish up with the soil rather in the form of a hillock round the stem than a hollow, as it is sure to sink. The tree should also stand on a well-trodden hillock raised in the centre of the hole. Before planting, all wounded and decayed portions of the roots should be pruned off, making the cuts so to slope, that when the tree is stood in position, the cut surface will press on the soil. Afford a mulch before bad weather sets in, which should be 4 or 5 inches thick, and stake the tree securely with three stakes, put in about 15 inches from the stem. If the head is very heavy, the longer branches may be somewhat cut back, and all weak shoots in the middle cut clean away.

BEONIAS: *C. K.* There will be less risk of loss of plants if you keep the seed in the capsules till the middle of the month of January, and then sow it thinly in shallow pans of light sandy peat and leaf mould. The plants should be raised in heat of from 65° to 75°, and grown on in the same during the spring and early summer.

CARNATIONS: *F. K.* We cannot undertake to name florists' flowers. Send them to some specialist.

THE PAST WEEK.

The following summary record of the weather for the week ending July 30, is furnished from the Meteorological Office:—

"The weather during this week was fair and dry until towards the end of the period, when rainy conditions appeared in the north, and sharp thunderstorms were experienced at many of our southern and south-eastern stations.

"The temperature slightly exceeded the mean in 'Scotland, N.,' and just equalled it in 'Scotland, W.,' and England, 'S.W.:' in all other districts it was again below the normal, the deficit ranging from only 1° or 2° in the extreme western districts, to as much as 4° in 'England, N.E. and E.' The higher of the maxima, which were recorded in most places either on the 29th or 30th, ranged from 77° in 'England, S. and S.W.,' and 70° in 'Scotland, E.,' to 72° in the 'Midland Counties' and 'England, N.W.,' and to 68° in the 'Channel Islands.' The lowest of the minima were registered during the early part of the week, and varied from 38° in 'Scotland, E.,' and 39° in the 'Midland Counties' and 'Ireland, N.,' to 48° in 'England, E.,' and to 53° in the 'Channel Islands.'

"The rainfall was much less than the mean, the total fall for the week being in most cases appreciably small.

"The bright sunshine continued less than the mean in 'Scotland, E.,' and 'England, E. and N.E.,' and showed a deficit in the 'Channel Islands' also; in all other districts, however, it was in excess. The percentage of the possible duration ranged from 59 in 'England, S.W.,' 52 in 'England, S.,' and 50 in 'Ireland, S.,' to 33 in 'England, E.,' and 29 in 'England, N.E.'"

VEGETABLES.

CARTER'S "HARBINGER" LETTUCE.

SOMEWHAT large plantings of this new Cabbage Lettuce were made by me this year in various situations—on south and north borders, and on the top of the Celery ridges, and in each case the subject has been most satisfactory. The leaves, forming the immense solid heads, are broad, light green in colour, beautifully curled and fringed, being well blanched, and of fine quality. It is a decided acquisition to our already fairly long list of Cabbage Lettuces. In appearance Harbinger resembles Sutton's Favourite, but it is more curled, and attains to a larger size than that excellent variety does, and, like it, Harbinger remains good for several weeks without showing a disposition to run. *H. W. Ward.*

FUNGUS: *A. J. H.* The fairy ring Champignon, *Marasmius oreades*. The giant Puff-ball is edible while still snow-white. Other Puff-balls are dangerous. The dried spores have a stupefying property.

GARDEN LABOUR: *Perplexed Gardener.* The staff of workmen might suffice under strict supervision if so many of them were not so much away from the garden attending to their own affairs; as it is, you seem to require the services of two extra workmen. It is, after all, a question for the employer to decide on the score of expense. Many employers would like to give more employment to their poor neighbours, but for the increase of wages which they can perhaps ill-afford to meet.

GLOXINIA: *J. B.* Your Gloxinia bloom is similar to Messrs. Sutton's Her Majesty, but not quite equal in size and substance.

GRAPES: *Subscriber, Worksop.* The Grapes were too much putrified to be properly examined. Send some that are not so badly affected, and we will have them examined. It seems to be a disease which is not at all common in this country.

HOW MUCH WOULD IT TAKE TO START A NURSERY BUSINESS THAT WOULD BRING IN £50 TO £60 PER ANNUM? *Gardener.* We should not care to advise you. Perhaps some of our correspondents who know something of the difficulties and hardships of having to exist on what a small capital brings in would kindly advise you. Locality near a large town in Scotland.

INSECT: *W. H. M.* *Sirex gigas*, a sawfly (see fig. 30). It bores into timber, and deposits its

FIG. 30.—SIREX GIGAS

eggs therein. Much like a hornet in appearance, but has no power to sting.

NAMES OF PLANTS.—Cloverseed. *Alstrœmeria aurantiaca.*—*Name of sender mislaid.* *Baptisia australis.*—*G. W. 1.* Arum, perhaps *A. arisarum*; 2, *Achillea Ptarmica* fl.; 3, *Stapelia*, which we cannot determine.—*F. A. G. 1.* *Rhus typhina*; 2, *Spirœa arifolia.*—*W. B. 1.* *Valeriana officinalis*; 2, *Asphodelus luteus*; 3, *Chlorophytum Sternbergianum*, variegated; 4, *Betonica carnea*; 5, *Veronica*; 6, *Spirœa Ulmaria*, double fl.; 7, *Hieracium aurantiacum*; 8, *Silphium laciniatum*; 9, *Aster*, not recognised.—*J. W.* Apparently *Veratrum viride.*—*G. H. K. 1.* *Ophiopogon apicatum variegatum*; 2, *Pellionia Daveauana*; 3, *Acalypha tricolor*; 4, *Euonymus europœus*, Spindle tree; 5, *Rhus Cotinus*; 6, *Betonica carnea*; 7, *Scrophularia nodosa.*—*Orchid.* *Cattleya granulosa Schofieldiana*, a very fine form of it, with the ground colour more yellow than usual.—*R. G.* *Epidendrum* sp.; but from the material sent we are unable to say which one.

NATIVE GUANO: *A. C.* This is a misnomer, it being nothing more than the residuum of town sewage chemically treated. Mixed with the potting-soil in the proportion of a peck to one barrow-load of the latter, or used as a top-dressing to your potted *Chrysanthemums*, it could not fail to have a beneficial effect on them.

COMMUNICATIONS RECEIVED.—*F. J. Rymer*—*S. Hawson.*—Secretary Southport and Birkdale Horticultural Society.—*Jas. Carter & Co.*—*Godfrey Lohenf.*—*M. T.*—*J. E. E.*—*J. S.*—*J. W.*—*E. A. R.*—*J. O'B.*—*H.*—*D. T. F.*—*J. D.*—*Senex.*—*E. S.* (next week).

OUR OCCUPATION'S GONE! "ROUGH ON RATS" DID IT.
SONG AND CHORUS, ROUGH ON RATS.

[MAY BE SUNG TO TUNE OF "LITTLE BROWN JUG."]

Squalling children, scolding wife,
 Were not the pests of my poor life;
 Where'er I lived, in house or flats,
 My plague has been those horrid Rats.
 They ate our meat, our bread, and shoes,
 We could not have a quiet snooze.
 One day my wife did chance to dose,
 They pinned my baby by the nose.

CHORUS—
 R-r-rats! Rats! Rough on Rats!
 Hang your dogs and drown your cats;
 We give a plan for every man
 To clear his house with ROUGH ON RATS.

Rough on Rats clears out Rats, Mice, Cockroaches, Water Bugs, Beetles, Bed Bugs, Flies, Moths, Ants, Insects, Potato Bugs, Hen Lice, Sparrows, Rabbits, Squirrels, Wood Lice, &c. Sold by Chemists all over the civilized world. Send for Circular how to destroy all kinds of Bugs, &c. 7½d., 1s., and 1s. 6d. Boxes, at Retail Chemists only.
F. NEWBERY & SONS, Wholesale Agents, 1, King Edward Street, Newgate Street, London, E.C.
 "Rough on Corns" gives instant relief, 8d. at Chemists.

I got a cat, I set a trap,
 And thought to have a quiet nap,
 But scarce in bed we snug were laid,
 When round the room the villains played.
 My wife jumped out upon the floor,
 To strike a light, but soon did roar,
 As well she might, for you must know,
 The steel-trap had her by the toe.

CHORUS—R-r-rats! Rats! Rats! Rough on Rats, etc.

But Rats were not the only pest,
 To spoil our food, and spoil our rest,
 Fresh trouble did each day arise—
 Mice, Roaches, Bugs, Mosquitoes, Flies.
 But now I've got the tip at last,
 And soundly sleep and eat quite fast;
 For we have hani-shed all the crew,
 And you shall learn the secret too.

CHORUS—R-r-rats! Rats! Rats! Rough on Rats, etc.

MESSINGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses, illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

GARDENERS AND OTHERS WANTING SITUATIONS, 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths and Marriages, 5s. each insertion.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON ST., STRAND, W.C.

WANT PLACES.

TO GARDENERS, AND OTHERS SEEKING SITUATIONS.

The Pressure upon our space at this season of the year is so great, we are compelled to state that advertisements received after 6 P.M. on Wednesday will, in all probability, be held over to the next week.

Advertisers are cautioned against having letters addressed to initials at Post-offices, as all letters so addressed are opened by the authorities and returned to the sender.

SCOTCH GARDENERS.—I have at present several very superior MEN on my Register, whose character and ability will bear the strictest investigation.—JOHN DOWDIE, Seedsman, 14, Princes Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

Head Gardeners.

JOHN LAING AND SONS can at present recommend with every confidence several energetic and practical Men of tested ability and first-rate character. Ladies and Gentlemen in want of GARDENERS and BAILIFFS, and HEAD GARDENERS for first-rate Establishments or Single-handed Situations, can be suited and have full particulars by applying at Stanstead Park Nurseries, Forest Hill, London, S.E.

SANDERS, St. Albans, can thoroughly RECOMMEND several first-class HEAD GARDENERS.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability, and thoroughly practical at their business. All particulars on application. Telegraphic and Postal Address—"DICKSONS, CHESTER."

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

J. W. SILVER can with the utmost confidence recommend a thoroughly industrious hard-working good all-round GARDENER, where one or two others are kept. Eight years' good character from last employer.—Streatham and Norbury Nurseries, S.W.

£10 BONUS will be paid by Advertiser to anyone giving him information of Gardening changes that will lead to his APPOINTMENT as HEAD. Highest references.—T. L. T., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Age 38, married, well up in all branches; fourteen years' good character in present situation.—WILLIAM POUCHER, Boultham Hall, Lincoln.

GARDENER (HEAD).—Age 30, married, no encumbrance; thoroughly experienced in Vines, Peaches, Melons, Cucumbers, Stove and Greenhouse Plants, Flower and Kitchen Gardens. Life experience. Four years in present situation. Excellent character.—A. B., Victoria Nursery, Beckeham.

GARDENER (HEAD), where two or three are kept.—Age 28, married; eleven years' experience.—J. CLEAR, Gardener to Lord Sudeley, Toddington, Winecomb, R.S.O., Glos., would be pleased to recommend a man as above.

GARDENER (HEAD WORKING).—Age 44, married; thorough all round. Twenty-eight years' practical experience in Fruits, Plants, Vegetables, &c. Six good testimonials.—W. JUPP, 28, Porten Road, West Kensington.

GARDENER (HEAD WORKING).—Age 41, married, no family; good practical experience in every branch of his profession.—J. Mr. Howeld, Old Catton, Norwich.

GARDENER (HEAD WORKING).—A LADY wishes to recommend her late Gardener; a good all-round Man; could manage Small Farm if required. Undeniable references.—W. RADLEY, Stisted Hall, Braintree, Essex.

GARDENER (HEAD WORKING); age 36, married, without family.—ADVERTISER, who has had a thorough training in all branches of Gardening, and sixteen years' experience in First-class Establishments, would be glad to send full particulars to any Lady or Gentleman requiring a good Gardener.—GEO. BLOOMFIELD, Rotheray Road, Luton, Beds.

GARDENER (HEAD WORKING), where two or three are kept.—Good experience in all branches. First-class testimonials.—C. K., Church Villa, Shepperton, Middlesex.

GARDENER (HEAD WORKING), where two or three are kept.—Age 30, married, one child; good all-round man, including Orchids. Excellent references.—BAZELEY, 1, Corner Hall, Boxmoor.

GARDENER (HEAD WORKING);—CHARLES FLACK, Head Gardener, Cholmondeley Castle, Malpas, would be pleased to recommend Richard Fawcett, who has been with him for two years, as a General Foreman, to any Lady or Gentleman requiring the services of a good Gardener.

SHOPMAN.—Age 26; ten years' experience. Thorough knowledge of the Trade in all branches. Good references.—B. J., 3, Alpha Terrace, Oswald Road, Oswestry.

HOLLOWAY'S OINTMENT and PILLS.

Indispensable Remedies.—In the use of these medicaments there need be no hesitation or doubt of their cooling, healing, and purifying properties. The Ointment stands unrivalled for the facility it displays in relieving, healing, and thoroughly curing the most inveterate sores and ulcers, and in cases of bad legs and bad breasts they act as a charm. The Pills are the most effectual remedy ever discovered for the cure of liver complaints, diseases most disastrous in their effect, deranging all the proper functions of the organs affected, inducing restlessness, melancholy, weariness, inability to sleep, and pain in the side, until the whole system is exhausted. These wonderful Pills, if taken according to the printed directions accompanying each box, strike at the root of the malady, stimulate the stomach and liver into a healthy action, and effect a complete cure.

SALES BY AUCTION.

Friday Next, August 19.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, August 19, at half-past 12 o'clock, by order of Mr. F. SANDER, St. Albans, a grand importation of—

CATTLEYA SPECIES, AUREA TYPE.

These are the true Cattleya aurea type, and every plant offered is warranted to belong to that class. There is no doubt whatever that Cattleya imschottiana, Hardyana, and Massiana, and other quite new varieties are among them; no collector was ever near the locality whence they came, and we have never before had an importation to offer in which we have had such absolute confidence as in this importation. We know that the species is simply extra.

The importation is in grand order, and dried flowers will be on view.

Also a very fine lot of a most striking PHAIUS, with large spikes, carrying many extra fine blooms.

A grand importation of the rare and beautiful CYPRIPEDIUM GODSE-FROYE LEUCOCHEILUM, the white-lipped form of this fine variety.

We are much pleased to be able at last to offer a fine importation of the above superb CYPRIPEDIUM—without doubt the finest of the section.

There will also be included the NEW EPIDENDRUM IMSCHOTTIANUM, the NEW EPIDENDRUM FOURNIERIANUM, a NEW MAXILLARIA, of singular habit; a few plants of the true EPIDENDRUM RANDI, and many other fine and valuable ORCHIDS.

On view morning of Sale, and Catalogues had.

Friday Next.

MESSRS. PROTHEROE AND MORRIS will include in their SALE on FRIDAY NEXT 24 sticks, comprising a quantity of PHALENOPSIS AMABILIS SCHILLERIANA and STUARTIANA to be sold as received. Also an importation of ASPLENIUMS, POLYPODIUMS, and about 60 CYATHEAS and DICKSONIAS received direct from New Zealand.

On view morning of Sale, and Catalogues had.

Peasmarsh, and Rye, Sussex.

By order of the Executors of the late Mr. J. Golding, To MARKET GARDENERS, FRUIT GROWERS, and others seeking a thoroughly genuine Business, established for many years.

MESSRS. PROTHEROE AND MORRIS, in conjunction with Mr. J. J. FRUIN, will SELL by AUCTION, at the "George Hotel," Rye, Sussex, on WEDNESDAY, August 21, at 3 o'clock P.M., in Two Lots, the exceedingly choice and productive FREEHOLD MARKET GARDEN and FRUIT GROUNDS, known as Little Lea, Peasmarsh, Sussex, comprising an area of 14 a. 1 r. 7 p., abundantly stocked with the best marketable kinds of top and bottom Orchard Fruit Trees, together with the convenient detached Residence, Stabling, and Outbuildings.

Also the LEASEHOLD MESSUAGE on the North side of the Channel running from the Fish Market to the Strand in the Town of Rye.

May be viewed. Particulars and Plans had at the place of Sale, of Messrs. DAVENPORT JONES and GLENISTER, Solicitors, Bank Buildings, Hastings; of Mr. J. J. FRUIN, Estate Agent, 31, White Rock Place, Hastings; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Monday, August 22.

DUTCH BULBS.

SPECIAL TRADE SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on MONDAY, August 22, THURSDAY, August 25, and MONDAY, August 29, large consignments of named HYACINTHS, TULIPS, CROCUS, NARCISSES, and other DUTCH BULBS, together with white ROMAN HYACINTHS and Paper-White NARCISSUS received direct for Unreserved Sale. These early auctions have been specially arranged in lots to suit the trade and other large buyers. The Auctioneers will be pleased to enter the names of intending purchasers on their permanent lists who may desire a regular supply of CATALOGUES for these Sales.

Auction Rooms and Offices, 67 and 68, Cheapside, London, E.C.

Nursery Stock Sales.

SEASON, 1892.

MESSRS. PROTHEROE AND MORRIS are now FIXING SALES of NURSERY STOCK for the coming season in all parts of the country.

Several important Auctions have already been booked, and with others now being arranged will shortly be announced in this paper.

Messrs. P. & M. will be glad to receive an early intimation of any further Sales, so that they may be included in this preliminary Advertisement.

Auction and Estate Offices, 67 and 68, Cheapside, London, E.C.

WANTED, to Purchase, 2 to 4 acres of LAND, near Station on Main Line, in view of Railway; not more than 14 miles from St. Paul's.

CHARLES WORTH, SHUTTLEWORTH, and CO., Heaton, Bradford; and 213, Park Road, Clapham, S.W.

FOR DISPOSAL, a SMALL NURSERY—about 3 acres. For particulars, apply to—

E. B., The Limes, Fildham, Cambs.

FLORIST and JOBBING BUSINESS for SALE, in one of the best suburbs of London. Over 500 feet-run of Houses, all well heated. Very long Lease, £1500, ground-rent. A good business attached. Price for the whole, £1000.—J. F., 41, Wellington Street, Strand, W.C.

SEED BUSINESS (Established) FOR DISPOSAL, in the North of England, doing a capital Counter Trade. Situated in a large Agricultural District, and with push and energy, could be greatly enhanced. This is an opportunity that seldom occurs. Every enquiry courted.

For further particulars, apply, X., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

LONDON, S.E.—For IMMEDIATE DISPOSAL, a well-situated FLORIST'S and NURSERYMAN'S BUSINESS, with jobbing trade attached.—Full particulars of X., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

SEED BUSINESS, for Disposal.—Well situated, and near station in a city in the north of England. Terms moderate.—Apply, B. J., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

To Nurseriesmen.

FOR IMMEDIATE DISPOSAL, a good and well-paying NURSERY BUSINESS, in North London; ten long Greenhouses, 1000 feet of Pipe, with Boilers in good condition, upwards of 10,000 Greenhouse Ferns, and other plants, Trade Utensils, and a useful Horse and Van. Rent of Ground, £10 per annum.

K. L. F. and SON, Auctioneers, Upper Edmonton.

TO BE SOLD, the Lease, Stock, and Goodwill of a small FLORIST and JOBBING BUSINESS in a good position. Good Dwelling-house and Stable; Greenhouses, Pits, &c., heated with hot water. To be had a bargain if sold at once. Satisfactory reasons for disposal.

Apply, G. L. WERBS, Newsagent, Grove Road, Holloway, N.

KENT—TO LET, about 2 Acres of good NURSERY GROUND, with three Glass-houses 100 feet long heated; large Potting-shed, &c.; 1 mile from railway station.—Full particulars, W. B., Orange Tree, Wilmington.

To Market Gardeners.

TO BE LET, about 20 acres of LAND, adjoining Barnes Common.—Particulars of Messrs. CHESTERTON and SONS, Surveyors, 22, Lower Phillimore Place, Kensington, W.

TO FLORISTS, MARKET GARDENERS, &c.—LAND well adapted for the above TO LET, on long Lease in 2 or more acre Plots. Also 20 acres FOR SALE, near Hampton Station.

M. F. EMBLETON, Suffolk House Hampton Hill.

To Fruit Growers, Market Gardeners, and Farmers. TO BE LET, at Michaelmas next, with the

Shooting, a superior FARM, near large Suburban Towns, forty-five minutes from London; 5½ acres, principally sound arable land; a considerable portion admirably adapted for Fruit Growing and Market Garden purposes; remainder, excellent Cereal, Root, and Sheep Land. Comfortable Residence, commodious Buildings (water laid on), and very moderate rent.

Particulars of ROBERT W. FULLER, MOON, and FULLER, Agents, Croydon, Reigate, and Epsom.

To Lovers of Gardens.

TO BE LET, a charming old MANOR HOUSE, recently restored, added to, and decorated, with very good walled Gardens, fully stocked with a fine Collection of Herbaceous Flowering Plants and Shrubs, and in perfect order; large Lawn Tennis Ground, Conservatory, Greenhouse, and Range of Heated Pits. The House contains ten Bed-rooms, five Sitting-rooms, and usual offices; Stabling for four or six Horses, Dog Kennels, Poultry Sheds, Mushroom House, and Paddock. Two miles from Lewes, Sussex; close to Church and Post; one hour and a quarter from London. Unfurnished; rent, £120. For further particulars, apply to J. HOUSLEY PALMER, The Lawn, Bournemouth.

VINERIES and HOATHOUSES TO LET.—

The VINERIES, PEACH-HOUSES, CONSERVATORIES, and other Glass and Hot-houses, at Castledykes, near Dumfries, with the Rothy and other erections connected therewith; also the GARDENER'S HOUSE, KITCHEN GARDEN, &c., all as now occupied by Mr. James W. Bayne, are TO LET on LEASE, with entry on September 1 next. The premises may be seen, and further information obtained, on application to JAMES H. MCGOWAN, Solicitor, Dumfries.—March 22, 1892.

FOR SALE—About 160 feet run of First-class VINERY, in full Working Order, with matured Vines; and SITE FOR SHOP, in a good business part of the Town of Reading; suitable for Working Gardener. Apply to—

W. G. MILLAR, 10, High Street, Reading.

To Gentlemen, Nurserymen, and Gardeners. FOR SALE, a bargain, three recently-erected GREENHOUSES, in good condition, each 80 feet long by 12 feet wide, with boiler and hot-water pipes of the best fitting, easily removed and refixed, being glazed without putty.

Apply, Mr. F. GOULD, St. James' Road, Kingston-on-Thames.

TRUE FROM THE INTRODUCERS—

LITTLE and BALLANTYNE,
ROYAL SEED and NURSERY ESTABLISHMENT,
CARLISLE.

Come and See.

It is absolutely necessary that all lovers of first-class gardening should pay our Nurseries a lengthy visit. Our many displays are splendid, and of the highest possible interest.

BEGONIAS (The Editor of *Gardeners' Chronicle* says he opines any further improvement in this flower).

The London Daily Press also says of our last exhibit in London, "Cannell's DOUBLE BEGONIAS rival anything we have seen."

Journal of Horticulture says:—"Cannell's BEGONIAS astonished the visitors."

Medal awarded. CACTUS DAHLIAS, nothing touches them in the world. Our Stock of everything required for high-class Gardening and Prize Winners, particularly seeds, is of the first importance to those who intend to succeed.

THE
Gardeners' Chronicle.

SATURDAY, AUGUST 13, 1892.

HIGHNAM COURT.

THE above mansion might well serve as a model of what a gentleman's country residence should be, so beautifully proportioned is it, while at the same time it is square, solid, and commodious. [It is, so far as regards the main building, the work of Inigo Jones, Ed.] But it is with the garden we have now to do, and here Mr. Parry's love of Conifers is everywhere apparent, for even through the walled garden there is a sombre but unique avenue of Irish Yews, each one a model of its kind, and apparently of the same age as those in front of the church. [They were really planted some few years later, Ed.] From here we pass into the most beautiful part of the garden, called the rockery or winter garden, as being sheltered on all sides from searching winds; it is doubtless a very snug and enjoyable spot in wintry weather. There had been a long drought previous to my visit, and the stream of water that meanders through it was almost dry, but it needed very little imagination to fill it to the brim, and then to look upwards from the rockery towards its source, to conjure up one of the loveliest bits of blended nature and art one could find anywhere.

Graceful Birches, Conifers, and Irish Yews contrast with each other, and dense masses of low-growing evergreens, relieved with clumps of Bambusa Metake and Arundinaria falcata, with here and there an Eucalyptus globulus, meet the eye; and along the margin of the stream choice perennials and bog-plants are planted.

Several fine specimens of Taxodium distichum stand on various well-chosen positions on the lawn, and at the time of our visit these were covered with the yellowish-green foliage, affording a charming background to the many spiky Conifers near. Here is the original specimen of Pinus Parryana, the golden-red bark of whose trunk and branches harmonises well with the gracefully pendent leaves.

To the right of one of the Taxodiums a small specimen Sequoia gigantea pendula is found, now developing its weeping character in a marked degree; and behind are some remarkable specimens of Abies pinsapo, 50 feet; and Picea Morinda, 30 feet. Just beyond are specimens of a fine Cedar of Lebanon and a Thuiopsis borealis, a specimen of the best of the Syringas (so called), Philadelphus speciosissimus, being planted in the angle between them, and in full flower at the time of my visit. To the north-east, at the back of the mansion, are some grand timber trees, and Conifers, Elms, Limes, Beech, with Pinus Laricio 70 feet, and P. austriaca about the same dimensions; while a fine Weymouth (P. strobus) to the left, and the rare

Pinus Sabiniana to the right, tend to soften and finish this fine group; at the same time a *Sequoia gigantea*, 65 feet, and a Douglas Fir, 60 feet, need no aid to bring them into prominent notice.

Near here is a detached conservatory planted out, in which there is a fine *Lapageria rosea*, on the roof; and at the east end, on Elm blocks, eight fine pieces of *Platycerium alcicorne*, looking natural and happy in their position and surroundings. Outside on a wall, left of the north door, is a healthy specimen of the singular *Garrya elliptica*, clothed in glossy bright foliage, which, when the long drooping catkins appear in the early spring, will be very handsome. It was pleasant also to note a departure from the ubiquitous zonal *Pelargoniums* in the beds on the lawn, the steward and head gardener, Mr. Sowray, using the almost forgotten purple Clary (*Salvia Horminum*), *Campanula carpatica*, *Cupheas*, &c.

Passing the north front, good use has here been made of the various Golden Yews, and *Retinosporas*; while in the distance, a magnificent *Abies nobilis* rears its majestic form above its surroundings full, too full, of cones, which have been from time to time thinned, but which are now left, as there is some danger in gathering them.

Two houses of a range are now standing here, the third, a fine fernery, having been smashed in the gale last June, which blew down a large Elm on to it. This gale, by-the-by, felled, or rather uprooted some hundreds of Elms and other trees round about Gloucester.

The remaining houses are devoted to foliage plants and other decorative subjects, the blank wall at one end being beautifully clothed with a *Cissus discolor* in lovely colour. The kitchen garden has been newly made, and was carrying some fine crops of Onions, Peas, and other vegetables, while Laxton's Jubilee Strawberry was fruiting most abundantly. Here are about a dozen *Araucaria imbricata* seedlings from home-grown seed, and a few nursery rows of Conifers for filling up.

THE PINETUM.

Approaching this through the lodge-gate in the Hereford Road, a fine Tulip tree (*Liriodendron tulipifera*) catches the eye on the right, but soon all interest is absorbed in the grand avenue of *Araucarias*, thirty in number, many being 30 to 40 feet high, and branched to their base. Beyond this are the Wellingtonias, the largest 90 to 100 feet high, standing like gigantic sentinels among smaller Firs.

Passing through a small wicket-gate, we enter the Pinetum proper, the first thing arresting attention being the special favourite of the late lamented Mr. Parry, another *Pinus Parryana*, probably twin-brother to that on the lawn. The beauty of the specimens is enhanced by the circumstance that they are planted on each side of a valley, while the smaller and more choice examples have been planted on the ridges, the protection of the older subjects having been taken advantage of to shelter these.

Towards the keeper's lodge are fine examples of *Pinus insignis*, *Halepensis*, *macrocarpa*, and *Benthiana*, while an *Abies Williamsoni*, judiciously placed, softens somewhat the massive beauty of these. Here are two *Pinus Parryana*, about 20 feet, inarched by Mr. Sowray, on *Pinus Laricio*, and seemingly taking from the stock that long-nodded habit peculiar to the Corsican Pine: one would think *P. Cembra* or *excelsa* would prove the better stock. Of these latter, close by are two majestic examples, fully 40 feet high, and well coned.

Passing the lodge, we come to a small plateau, on which many of the latest additions have been planted; notably *Abies Hookeriana*, 5 feet, lovely, glaucous, and not unlike *Cedrus atlantica*; *Fitzroya patagonica*, 7 feet; *Abies magnifica*, in robust health, showing an almost peacock-blue-like sheen on its lovely foliage. But our steps are arrested here by one of the most perfect trees in the Pinetum, which must be seen to be duly appreciated; it is an *Abies grandis*, fully 50 feet high, feathered to the ground, and forming a gloriously noble pyramid of leafage. While standing before such a forest monarch, one can sympathise with the *Araucarians* who worshipped the *Araucarias* and other noble Conifers, while they were also dependent upon them for their food and shelter.

Passing over a ruined rustic bridge the other path is reached, and here a glimpse of the surrounding country is caught over the tree-tops. Immediately two fine specimens are reached, a *Cryptomeria Lobbi*, well furnished, 40 feet, and an *Abies nobilis* of lovely proportion; on the left a Douglas Fir, the leader of which was blown out in the gale of 1891, producing apparently a greater development of lateral branches, for it now exhibits glorious festoons of foliage and cones, sweeping in grand curves to the sward. As if in strong contrast to this, next is a towering specimen of *Picea orientalis*, 70 feet, symmetrical and graceful, and near a lovely glaucous *Abies Alcoquiiana* [probably *Ajanensis*. Ed.], with almost blue young growth, a worthy memento of Sir Rutherford Alcock of Japanese fame. Near, we have a *Picea Morinda*, popularly "Horse-mane Spruce," from its closely pendulous laterals hanging on either side of its regular branches, and sweeping almost to the ground.

Then from British Columbia, the *Abies Albertiana*, with its closely packed Yew-like branches, and a fine healthy *Abies Lowiana*, quite uninjured by frost, a *Menzies Spruce*, the fine Colorado variety; and from the same district a grand specimen *Picea pungens glauca*, with its branches covered with its sharp needles, like frosted silver in colour; and two more highly-coloured Conifers, *Cupressus Lawsoni lutescens*, 10 feet, and *Juniperus sinensis aurea* (Young's variety) 8 feet, line in colour, but the bottom spoiled by hares. As if in hard contrast, here is a *Cupressus erecta viridis*, 18 feet, presenting an unbroken pyramid of foliage; and a *Cupressus torulosa*, 24 feet.

For a few moments we here leave Pines, and revel in some grand specimen *Arbor-vite*, *Cypresses*, and *Taxads*, most notable among which were *Thuja occidentalis*, 50 feet; *Cupressus Lawsoni*, 30 feet; and a little further, looking as if it had weathered the gales on the slopes of Ben Lomond, a bizarre *Pinus montana*. Here we have a specimen of the Lombardy Poplar among Conifers, a Swedish Juniper, as compact as a Broom, at least 30 feet high, and not more than 5 feet through at its base; a *Taxus elegantissima*, its young growth carrying a beautiful golden tint; while variety is secured by a *Cryptomeria japonica*, 40 feet; and a *Sequoia sempervirens*, at least 10 feet higher; with columnar examples of Irish and Chinese Junipers towering above all, with the gracefully drooping *Juniperus recurvata* in most judicious contrast.

In a sheltered nook is a pretty specimen *Cupressus Lawsoni alba spica*, 5 feet, well in character. Next we have a grand group of *Araucarias*, *A. imbricata foemina*, with elegant branches, the upper ones coning, and the male form with the sturdier growth, bearing its pollen

cones in plenty. Near is a Californian monarch of the forest, *Abies Lowiana*, 75 to 80 feet high, yet perfect to its base, a truly grand specimen; on each side other North American denizens, *Thuja gigantea* var. *compacta*, 40 feet; and *Thuopsis borealis*, the Nootka Sound Juniper, 30 feet. Here, from a rustic seat, may be enjoyed a view over the wooded park, towards Gloucester, the massive Oak and Elm tops of which the park mainly consists, being deprived of their monotony by the towering spires of the giant Wellingtonias on the horizontal line.

In conclusion, I must now note a few extra choice "bits" lately added, these being what may be called "florist's varieties," viz., old favourites variously coloured or presenting some peculiarity of growth or habit, and selections from some extensive seed bed, though occasionally aboriginal varieties.

Cedrus Deodara alba spica of continental origin, *Thuopsis borealis aurea* var. from Surrey, *Retinispora plumosa aurea*, among the first are well represented, while among the last may be named the singular *Retinispora filifera* and *R. filicoides*, and a pretty specimen of *Pinus flexilis*; while towering above all is a grand columnar specimen of *Libocedrus decurrens*.

Then we have *Sequoia gigantea aurea variegata*, for which a most eligible nook has been found. Nevertheless, it is not looking happy, and I fear will not notice "yellow." I now turn aside, compelled to notice a perfect specimen of *Pinus Bolanderi*, 12 feet; and, lastly, a perfect gem in *Pinus parviflora*, and a *Cupressus thuoides nana*, which at my last visit was a wee thing, but is now fully 15 feet high, and perfect of its kind; in a line with it *Thuopsis dolabrata*, promising to make a fine specimen; and by it one of the handsomest of the Red Cedar group—*Juniperus schottii*. *Senec.*

NEW OR NOTEWORTHY PLANTS.

ODONTOGLOSSUM OWENIANUM, *Rolfe, n. sp.**

This distinct and pretty *Odontoglossum* was introduced by Messrs. F. Sander & Co., of St. Albans, with whom it flowered a short time ago. Whether it is a good species or only a natural hybrid, does not at present seem quite certain. The shape of the lip in some respects recalls *O. Pescatorei*, yet it is very distinct from any other form which I have seen, and I do not quite see what particular combination would produce it. The white lip, yellowish-white petals, with or without a chocolate blotch, and the sepals with the whole of the disc of the latter colour, give it a very distinctive appearance. It is dedicated to G. Dyson Owen, Esq., of Selwood, Rotherham, Yorkshire. I hope to see it again on a future occasion. *R. A. Rolfe.*

CIRRHOPELALUM THOUARSHI, *Linbl.*, AND VAR. CONCOLOR.

Some time ago attention was called to the flowering of this rare old Mauritian species, the type of the genus at Kew (see *Gardeners' Chronicle*, 1891, part ii., p. 69; also *Botanical Magazine*, t. 7214).

* *Odontoglossum Owenianum*, n. sp.—Raceme six-flowered. Sepals lanceolate, acuminate, undulate, 17 lines long by 4 lines broad, pale whitish-yellow, with the whole of the disc chocolate. Petals rather broader, pale yellowish-white, sometimes with one chocolate blotch in the centre. Lip unguiculate, limb-precising, pandurate-oblong, shortly acuminate, with deflexed apex, irregularly or spred-denticulate, wholly white, 1 inch long by 8 lines broad at base; crest consisting of a pair of short central plate-like teeth, and a pair of smaller diverging teeth on either side. Column 8 lines long, white behind, and with a yellow stain in front below the light-brown stigma; wings short, acute, irregularly and shortly toothed, marbled and suffused with light brown. *R. A. R.*

Singularly enough, the plant which bloomed last year had flowers of a uniform light-yellow tint, yet they presented no other peculiarity. This year a second plant sent by Mr. Bewsher has flowered, quite identical in structure, but having the flowers densely speckled with brownish-red, as in several other allied species. This is really the typical form, which has not flowered in cultivation before (the Philippine plant which bears the name in gardens being different), and the pale yellow form may therefore be distinguished as variety *concolor*. *R. A. Rolfe*.

*ZYGOPETALUM GRAMINIFOLIUM, Rolfe, n. sp.**

This elegant little *Zygopetalum* is a native of South Brazil, and was introduced some time ago by Messrs. F. Sander & Co., of St. Albans, on stems of *Lomaria Boryana*. At first I thought it must be a narrow-leaved variety of the old *Z. maxillare*, Lodd., but it has now flowered on several different occasions, and proves quite constant in character, so that its claim to specific rank may readily be conceded. There are three closely-allied species, whose peculiarity is to grow upon the stems of Tree Ferns, namely, the two just mentioned and *Z. Gantieri*, Lem. All are likewise characterised by the possession of an unusually large horseshoe-shaped crest. *Z. graminifolium* may be readily distinguished from the others by its much more slender creeping rhizome, smaller pseudobulbs, and much narrower grass-like leaves. The racemes are erect, and five to seven-flowered; the sepals and petals light green, heavily blotched with dark brown, and the lip of a uniform bright purple-blue. It is a graceful and very pretty little plant. *R. A. Rolfe*.

AGAVE FRANZOSINI.

This prince of the Agaves has flowered again this summer, in the celebrated garden of Mr. Thomas Hanbury, at La Mortola, and we have now obtained material for a complete description of the species. It is a most striking object when it reaches its full development, with a general habit like that of the familiar *Agave americana*, with its intensely glaucous leaves, having a spread of 16 or 18 feet, and its great candelabrum-like panicle, rising to a height of 40 feet. The previous accounts of it will be found in a paper by Mr. Philip Sewell in the *Gardeners' Chronicle* for 1889, vol. ii., p. 638, and in my own report on a visit to the Riviera in the number for January, 1892, of the *Kew Bulletin*. It belongs to the section *Submarginatae*, which differs from the *Americanae* by the terminal spine being decurrent as a border to the upper part of the leaf. Mr. Hanbury tells me it was introduced to the La Mortola garden in 1878, and was probably named in honour of Francesco Franzosini, proprietor of the Villa Franzosini, and also of a fine garden on the banks of the Lago Maggiore, which was rented for some years by the late Sir George Maclean. The following is a full description of the plant: Acaulescent, leaves thirty to forty in a rosette, oblong-spatulate, intensely glaucous, reaching a length of 8 to 9 feet, and a breadth of a foot at the middle, very rigid in texture, with a very pungent brown-black end-spine, which is decurrent for some distance down the margins, and distant, brown-black, deltoid, cuspidate, hooked or straight teeth, $\frac{1}{3}$ to $\frac{1}{2}$ inch long. P-duncle with panicle reaching a length of 40 feet. Flowers in dense clusters; ultimate pedicels about $\frac{1}{2}$ inch long; bracts small, ovate-lanceolate. Ovary bright green, oblong, obscurely trigonous, 2 inches long, $\frac{1}{2}$ to $\frac{3}{8}$ inch diameter. Perianth-tube 1 inch long, green in the lower half, yellow in the upper; lobes yellow, linear, complicate, as long as the tube. Stamens inserted at the middle of the perianth-tube; filaments yellow, 3 inches long; anthers linear, above

* *Zygopetalum graminifolium*, n. sp. — Rhizomes very slender, creeping round the stems of *Lomaria Boryana*. Pseudobulbs small, ovoid-oblong. Leaves narrowly lanceolate-linear, acuminate, oerved, 8 to 12 inches long, 3 to $4\frac{1}{2}$ lines broad. Scapes erect, five to seven-flowered. Bracts lanceolate-ovate, acute, base sheathing, 1 to $1\frac{1}{2}$ inch long. Petals like sepals, but narrower towards base. Lip broadly obovate or obcordate, 1 inch long, $\frac{3}{4}$ inch broad; crest very large, horseshoe-shaped, crenate. Column clavate, $\frac{1}{2}$ inch long. Native of South Brazil. *R. A. R.*

1 inch long. Style finally overtopping the stamens, $4\frac{1}{2}$ inches long. I am indebted to Mr. Hanbury's head gardener, Mr. Cronmeyer, for kindly sending the flowers from which the accompanying drawing (fig. 31, p. 181) was made. *J. G. Baker*.

ORAL INSTRUCTION IN HORTICULTURE, AND THE OBJECT TEACHING OF GARDENING.

As one of those engaged in the new departure of teaching horticulture by tongue and through object lessons, in addition to pen and practice, permit me to thank the *Gardeners' Chronicle* for its generous appreciation of our work in a recent issue (see p. 100), as well as for its hearty sympathy and generous support during the earlier stages of the movement. With firm faith in the popularity of horticulture among the masses, and in the ability of practical cultivators to make it yet more attractive, useful, and intelligible to all classes—a faith so far justified by results, the *Gardeners' Chronicle* stood manfully by the new forward movement. The *Gardeners' Chronicle* fostered the new enterprise from the first, and it is largely through its counsel and guidance that, in so short a period, it has reached its present promising condition.

In this case there is not the slightest occasion for jealousy between science and practice, far less between the platform and the press. In the present day the science that is out of practical use is held of little account, while practical men that essay to reveal the foundations of their practice are bound to talk or write science. And as to the platform just erected, is it not filled with the older scholars of the press and practice combined? and all engaged in the oral and object teaching of gardening will only be too pleased to listen to the wise monitions of the press, and to learn as many new lessons as possible from scientific authorities as to the life, the wants, and the ways of plants, and how to make all these more readily understood by the people, and thus bring the knowledge, the pleasures, and the profits of horticulture more directly and immediately to bear on the enrichment and elevation of their lives.

The first great business of the oral and object teacher is the creation of the desire for such knowledge and possessions. As in higher matters, so in horticultural aspirations. The whole tendency of the age trends in that direction. Nothing can hinder its realisation to the full but crass folly or sheer ignorance. The horticultural press has done much to create and strengthen faith in the value of horticulture as one of the most powerful and readily-applicable means of making life among the masses more worth living.

Oral and object teaching must needs quicken the pace in the same direction. It has brought a new sensation; created a new interest in the rural districts. The writer was often astonished to see, in bitterly wintry weather, men and women turn out and listen earnestly, for an hour or more, to lectures on the mysteries of growth, modes of production, means of improvement, and probabilities of profit. The object lessons show them not only what can be, but what has been done, and thus scores of them decide on the spot that they can and will, with a little further help, do likewise.

I venture to add that examinations can by no means be considered as a measure of the solid results of such lectures. Neither would it be wise to push examinations fast nor too far. To classify mixed audiences into classes for examinations might hinder their usefulness—must alter their character. They consist of the fathers and mothers of villages, grown-up sons and daughters, and the larger children of the schools. They enjoy amazingly asking the oral teacher questions when once put thoroughly at their ease, but great silence falls over them when you begin to question them. Longer practice, riper experience, may make rural audiences as ready to answer questions as to ask them, but assuredly that time is not yet. And after, all the time in most districts has been short. I have not

yet given more than five lectures in any one district. My first and main objects have been to create an interest, to make all feel at home, free, ready to question me on every point they cared to know. So far the lectures were quite successful, and I considered that enough for a first experiment. But I have lately been asked as to examination results, offered forms, with help, &c. I confess to being slightly in doubt about it at this stage. Fruit-tree clubs, fruit plantations in most cottagers' gardens, regular attendances, eager attention, showers of questions, the testimonies of clergymen, county councillors, farmers, and large employers, in favour of good done, may be of equal or more value than examinations. Of course, all this in reference to mixed rural audiences, such as one has the pleasure of meeting in villages. In cases of classes formed of adult scholars, the case is quite different. I should be glad of the opinion of other lecturers on the examinations. Of course, it is the fashionable mode of totting up results, so-called, but under the conditions stated I hardly see how or when it should come in, or how it is to give a true measure of work done. *D. T. Fish*.

FOREIGN CORRESPONDENCE.

GARDENING NOTES FROM NEW ORLEANS.

The British Consul at New Orleans, reporting to the Foreign Office on the agriculture of his consular district, refers to the system adopted in the cultivation of Strawberries as follows:—There are, he says, two distinct ways of renewing Strawberry plantations. The one which is generally preferred and adopted being simply transplantation, and the other some form of self-renewal by the agency of runners. An objection to the latter is the continued occupation of the same piece of ground, the fertility being partly exhausted by the previous growth. This objection may in a great degree be remedied by copious and skilful manuring, and if the soil has been found by trial to be especially benefited by some particular fertiliser, the plant will be improved by an addition of it to the barn manure. A mode adopted by a cultivator in Canada, and reported to a fruit-growers' meeting, was found to have some particular advantages. The rows were not 4 feet apart, and when renewing was desired the old rows were rolled over and not ploughed up, and the trench thus formed was filled with fine manure, the old plants sending their runners over it and taking strong hold. The next season the old row was cut out, and the new plants given entire possession. Another mode is to plough the ground which has become densely filled with Strawberry plants, leaving a strip 6 inches wide of the old plants, which will form a narrow matted row, and filling the shallow furrows with fine old manure. All the runners but two are cut off immediately after the gathering of the crop, and these two produce each a new plant. The middle row after fruiting may be cut out. Still another mode has been used, where a few rare plants have to be removed to another place in the same garden. Square cavities are made with the spade in regular rows, and then the plants are lifted with a mass of earth on them, and placed in position in the new bed. This work may be done at any time in the year when the ground is not frozen. Ripe fruit has been produced in this way six weeks after early spring planting. Caution is necessary in adopting this mode on adhesive or heavy soils, not to press it with the spade with such firmness as to make it compact, solid or adhesive.

The following method is given of grafting the American species of *Diospyros* upon the Japanese *Kaki* (*D. Kaki*) as practised in Florida. The writer says:—"My choice of all the processes for propagating the *Kaki* is root-grafting on native *Per-simmon* stock, and, if possible, where the native tree comes up, and best sizes are from $\frac{1}{2}$ inch to $1\frac{1}{2}$ inches in diameter at the crown. It is not a serious objection if they stand within 1 foot from each other, or the roots can readily be transplanted in

grove form, and when the leaves are off, and at the end of the following year root grafted. Grafts will grow if put in from November until the leaf buds begin to swell on the native Persimmon. Kakia 'leave out' in this portion of Florida later than the native trees. The grafting is so simple a process that even a novice may succeed with very little previous experience. After selecting the stick to be grafted, it is cut or sawn off at the ground or below the surface, if the 'stock' is long enough to allow splitting and inserting the graft. The graft should be cut wedge-shaped, the slopes about three-fourths of an inch long, leaving more bark on the (to be) split 'stock.' Then place a piece of old cloth or paper over the top of the stock, and heap damp earth on it, just covering the top of the graft. Grafting wax is not required."

The Peccan Nut (*Carya* spp.) is said to be a profitable plant for cultivation, a full bearing tree being worth, near New Orleans, from twenty-five to fifty dollars a year. It is generally propagated from seed, that being the easiest and surest method of obtaining a stand. In growing this nut it is fully understood that the seed does not always produce its like, unless gathered from a grove that produces the large variety, or from a tree sufficiently isolated from other inferior kinds.

For planting purposes nothing but the large soft (or so-called paper shell) kinds should be chosen. These must be from the new crop, used as fresh as possible, or packed for future use in moist sand or leaf-mould. The best soil for a Peccan grove is a creek or river bottom. An occasional overflow does not harm the young tree, provided it does not cover it up entirely, or does not remain too long. In setting out a seedling orchard it is always advisable to give them plenty of room, 70 to 75 feet is none too close where the soil is low and rich, or 50 feet on poorer uplands. The land set aside for the orchard must be both hog and cattle proof until the trees are large and strong enough to escape injury from stock. When the time arrives for planting, a stake may be driven where the tree is to remain permanently, and from two to three nuts placed near the stake, about 2½ to 3 inches below the surface, and a mould of forest leaves, or leaf-mould, applied, which will prevent the seed from drying out. This may be raked aside the following spring. If the seed has been properly selected and preserved, nearly all will grow. The extra plants, with the nuts attached, may be carefully transplanted, either into the nursery or used in extending the orchard.

However careful the cultivation may be, and however large the crop of fruit, it will be unprofitable unless well and carefully packed for market. Many thousand dollars worth of fruit is yearly thrown away because proper care was not exercised in handling before shipment. From the time the fruit is plucked from the tree it should be handled as carefully as if each were an egg. The slightest bruise, scratch, over-ripeness, or accumulation of moisture, is a detriment, and may cause several dollars loss. For keeping purposes the fruit should be kept cool and dry. Peccan nuts are imported into England in small quantities as a dessert nut.

A TRAVELLER'S NOTES.

(Continued from p. 68.)

Gwalior, December.—The gardens surround two palaces, both huge white stone structures of comparatively recent date. These two palaces (the older of which is certainly the handsomer) are surrounded by a high wall, 4 miles long, enclosing some fourteen irregular walled-in spaces. The entrances are guarded, and access forbidden to all. These fourteen walled-in spaces, usually with a white stone pavilion in or near the centre, form a perfect maze; these pavilions were used for rest-houses, the roads and paths in each enclosure always centring towards the building. Large gateways lead from one enclosure to the other; each enclosure is laid out with large beds, or rather shrubberies, each enclosed within a low close-cut hedge, usually of *Lawsonia alba* or *Duranta Ellisii*. In every case these shrubberies consist of Oranges, Limes, and Guavas, some in a wretched condition,

some pretty fair. Mr. Maries, with whom I stayed, is not allowed to alter these and plant them as he would like, as they were made by the late Maharajah, and must not be touched. He, however, says it is curious how many die for want of water in the hot season. Doubtless in time he will be able to lay these enclosures out as he has the portion of the ground round the new palace. In some of these enclosures a thick jungle of the common Plantain is to be seen. It is cultivated for the Maharajah and all living in the palace to eat off, about 2000 leaves being required daily. It does fairly well, but the climate here is too cold for the choicer varieties.

Mr. Maries pays a daily visit to the gardens, and usually enters by the gate nearest the railway into the enclosure known as the Old Deer Park. This is but a few acres in extent, and here he has been allowed to make a few improvements. A white stone museum, the foundations of which are only just laid, is in course of erection. Over this he is to have full charge, a task after his own heart. A nice level tennis-lawn of Doab grass, for the use of the Maharajah, his friends, and his tutor, is a little beyond, flanked on one side by a model plantation of inarched Mangoes; these have just been planted. On the other side, near the wall dividing this from the next enclosure, are some splendid dwarf Roses, better than many one sees in England. They are grafted on *Rosa gigantea*, a species growing with great freedom here, and are kept for cutting purposes, Mr. Maries being able by judicious pruning to supply cut Roses all the year round. Those I saw in the Old Deer Park were pruned in October, and have now shoots a foot long, and some nice plump buds. A long oblong bed of *Maréchal Niel* is very striking; it grows with such luxuriance as to be little better than a tangled mass. The foliage is of a good colour, the plants being evidently in fine condition.

Behind the tennis-court is a level stretch of Doab grass for tent-pegging, with a young row of newly-planted *Dalbergia robusta*, at present not more than 10 feet high on either side. Its pretty oval pinæ are, I think, more graceful than the foliage of *Dalbergia Sissoo*, so common about here. Within the Old Deer Park, but a few yards from the tennis-court, is a covered court for the old English game of tennis—much like the one at Hampton Court; the bank outside has been planted with young *Beaumontia grandiflora*. Mr. Maries tells me this is splendid when in flower. Some *Eucalyptus robusta*, but two years old and 10 feet high, are near here, as well as some beds of *Jasminum Sambac*, and other plants producing sacred flowers specially grown for cutting for "Poojers," or worship, as well as for "Durbars." One of the niches in the tennis-court is planted with *Acalypha Macfarlanei*—a splendid colour here—brighter, I think, than I have seen it elsewhere.

The next enclosure to the Old Deer Park is full of Limes and Oranges, whilst another contains Guavas, of which Mr. Maries has about fifteen varieties.

A fine avenue of a species of *Artocarpus*, commonly known as the Monkey Jack, is on one side of the sacred bathing-tank, whilst on the other are some fine Peepul trees (*Ficus religiosa*), and some Mowah, beyond being some irregularly-shaped shrubberies of Oranges, Limes, Guavas, and custard Apples (*Anona*), enclosed by low closely-clipped hedges—usually *Duranta* and *Lawsonia*—though *Jasminum pubescens* is also used, making a pretty hedge.

We soon entered Mr. Maries' nursery and propagating department, chiefly filled with plants ready for permanent plantations or for decoration at the palace—it was wonderfully clean.

There are two or three small glasshouses, a long pit, and two large enclosures, one here and one in another part of the garden, the one in the nursery being covered with the dried canes of Monje-grass, whilst the one further away and nearer the palace, is covered with dried Khaso-grass, supported in both cases by wire-netting on iron rafters and rough stone pillars.

The two small houses are chiefly used for raising seedlings—more particularly young Ferns, in which Mr. Maries takes great interest; he has a special system, which is certainly very successful—his Ferns are wonderfully fresh and green when one considers they are grown in the plains of Central India. In one house are some young *Adiantum tenerum*, as well as a curiously curled variety of this species, some *A. Regine*, and *Lastrea lepida* seedlings only a few inches high, some young cuttings of *Coleus*—nice bright varieties—just struck, whilst in the other house just opposite, some young Conifer seeds,

chiefly *Thuia*s, were germinating freely. *Casuarinas* were also to be seen in a seedling state; these are considered, as in other places I have been to, most difficult to raise—though when once started they make big trees. *Arundinaria falcata* was also being propagated in this house. Pine-apples are cultivated in a glass-covered enclosure (not included in the two mentioned), with big pots of healthy-looking *Eucharis* and *Rhaphis tabelliformis*. One, which Mr. Maries calls *R. elegans*, much like our *humilis*, is here grown for decoration. Some young *Caryota sobolifera*, a branching species of quicker growth and with broader leaflets than *C. urens*, are also waiting in the glass-covered enclosure for planting out. Some *Latania*s and *Coryphas*, 2 to 3 feet high, were very smart, as well as some *Oreodoxa*s, and the handsome *Livistonia Jenkinsii*, from Assam. Mr. Maries pointed out some pots of what he considers to be a new *Pteris*—a native of Nepal—it is certainly very pretty, with fronds 2 to 3 feet long. The glass-pit—a lean-to against a high wall, is just beyond the little office, and parallel with the glasshouses—it is chiefly used for striking cuttings, at the present moment being partially filled with some store pots of *Murraya exotica*, *Gardenias*, *Rosa gigantea*, usually five cuttings round the edge of each pot.

Immediately at the end of the glass pit is the immense grass-covered store-house; herein plants are kept ready for decoration, and newly-rooted cuttings from the glass pit often temporarily placed. In this store-house I saw some clean young *Livistonia*s, *Areca sapida*, *A. lutescens*, as well as some *Kentias*, which Mr. Maries says do well outside. Also some pretty foliage *Begonia*s, hybrids between *Begonia Rex* and a Sikkim variety, with pretty bronze and silver tinted foliage, raised on the place.

A few *Dendrobium Pierardi*, the only one Mr. Maries can do much with, hang from the roof at one end, whilst *Adiantum*s of all kinds line the stone beds filled with small plants in pots—clean and healthy—and ready at a moment's notice to be sent to decorate the palace.

Outside this store-house are small plants, all ready for planting out, an operation usually performed in the rains—though Mr. Maries finds by keeping plants in pots they can be planted during the cold season, if subsequently judiciously watered. A quaint kind of brush is used for washing the Palm leaves—as well as for painting lights, and reflects credit on Mr. Maries' ingenuity—it is a short piece some 6 to 8 inches long, of the base of a midrib of a *Phoenix* leaf—one end—for about half an inch being spread—it makes a cheap and durable article; I saw it being effectually used on the foliage of some *Livistonia*s.

A few other Orchids besides the *Dendrobium Pierardi* on the low roof are grown, such as *Saccobulbium Blumei* and *Acridas affine*—they are, however, not in good condition, having been neglected during Mr. Maries' stay in England last summer. On passing by a low doorway defining the limit of the nursery in this direction, and dividing it off from the road adjoining, not far away, at right angles, the one leading up to the main gateway to the palace, a large lake with an island in the centre is reached. In this portion of the park immediately in front and around the palace, Mr. Maries has been allowed to plant as he likes, and one recognises the English forms of the beds, shrubberies, &c.

The road between the nursery wall and the lake is shaded by some fine Peepul trees (*Ficus religiosa*), and leads into a broad gravelled path, flanked on one side by a tall, handsome iron fence and on the other by the lake. The iron fence has been planted with *Rose Cloth of Gold* and *R. citriodora*, which in time will hide the stone parapet, some 3 feet high, supporting the ironwork. Beyond the iron fence is the dreary waste of the natural country, little else but sandy dry soil and Bahools; though in one place there is a large pond from which the water in the tank is obtained. In the rains the lake or tank rises high, and last year broke down portions of the road; in reality, the top of a large embankment, which leads to the main gate.

Adjoining the iron fence is a high wall, broken in the centre by the main gateway, which is exactly opposite the palace. At the end of this wall, several hundred yards in length, are the elephant stables, in which some thirty fine brutes are confined. I am told when one breaks loose, especially if it be a "mad" one, there is sad havoc in the garden.

Against this wall *Bougainvilleas* and *Roses* have been alternately planted; whilst on the opposite side from the lake up to the road leading from the main gateway to the palace, is a thick shrubbery, chiefly

composed of *Acalyphas*, with taller Nims (*Azadirachta indica*) behind.

The plants massed in the bends of this shrubbery—an idea, I am told, of the young Maharajah—are such things as *Bougainvilleas*, *Acalyphas*, *Poinsettias*, *Poincianas*, *Bamboos*, &c.

In this shrubbery, near a little path leading to the grass-roofed house already mentioned as being near the palace, is a young Mango, with the young foliage beautifully tinted with a rich glossy brown, a not uncommon feature even with seedlings. Another nice tree in this shrubbery is *Colvillea racemosa*; I hear its flowers are much like a *Tritoma*, but pendulous and larger. When in flower, it is much frequented by blue humming-birds, forming a striking contrast in colour; the tree in question is but three years old, and 30 feet high. There is also leading away from the high boundary wall and parallel with the lake, one of the stone irrigation canals. The irrigation in this park is very perfect, and deserves a word. The water is obtained from nine reservoirs in the hills, the largest reservoir being little short of a mile

At the end of this grass-roofed store-house is a small glasshouse, chiefly filled with Ferns, and kept for the Maharajah, to take whatever and whenever he likes. He has developed a great fondness and interest for Ferns, almost unknown here before Mr. Maries came. In this little house he has *Crotons*, *Pteris Bausei*, *Gymnogramma argyrophylla*, as well as the *Adiantums*; they look wonderfully fresh and healthy.

One again soon reaches the lake. I noticed the edging to the shrubberies on this side are often *Ixoras* or *Jasminum pubescens*.

A new marble rest-house is to be built on a low embankment not far from here, covered with *Bougainvillea glabra*—the effect will be pretty. A Chinese Banyan—a graceful, drooping, low shrub—is also used here; it is exceedingly pretty, but I was unable to find out the botanical name.

The Water Palace, a white stone, prettily domed structure, on the edge of a large tank, is passed on leaving the park.

Just before I left the park, we had a look at the

the last ten or fifteen years such fine new varieties have been added to the fancy section as to almost cause raisers to despair whether improvements can be effected in them. Really, we look for new fancy varieties almost if not exclusively from Slough, and if others are sent out from other sources, they seldom if ever come to the fore as exhibition plants. It is curious to note how two or three varieties raised thirty and forty years ago still find a place in lists; they are—Henderson's Cloth of Silver, which has never been surpassed for its peculiar colour; *Delicatum* (*Ambrose*), almost unequalled for its profusion of bloom; and *Roi des Fantaisies*, which has a striking novelty of colour, a combination of rosy-crimson and white peculiarly its own.

The origin of the fancy *Pelargonium* has never to my knowledge been authoritatively set forth. It is generally supposed to have come from a species, probably *P. inquinans*. The varieties of the fancy type stand in the same relation to the show *Pelargonium* as the feminine does to the masculine. There is a delicacy of habit, a peculiar softness of tint in many; they are so sweetly fair that they are differentiated in a remarkable degree from the more vigorous and robust large-flowered types. They should not have a stove treatment, but they need to be kept warm and fairly moist while they are growing into size and perfecting their head of bloom. The habit of growth is close, and, indeed, generally very dense; and the freedom of bloom is so great, that when fully developed upon well-grown plants it is difficult to discover many leaves, so completely are they hidden from view.

A selection of a dozen of the best varieties should include only those raised at the Royal Nursery, Slough, such as *Ambassadors*, soft lilac-rose, white centre; *Dorothy*, white, with small carmine spots on the top petals—a very pretty light variety; *East Lynne*, crimson-purple—one of the largest; *Ellen Beck*, lilac-carmine, with pale bright margins; *Lona*, pale lower, deep lilac-rose top petals, with a distinct blotch on each; *Lady Carrington*, soft pale peach, pale pink upper petals; *Mrs. Hart*, bright crimson-purple and rose, variegated with white; *Mrs. Langtry*, white, with bold rosy-lilac spots on the top petals; *Phyllis*, deep rose, large white centre; *Pilgrimage*, pale lilac, white centre and edges; *Princess of Teck*, white with carmine spots, at once one of the most distinct, finest formed, freest, and most attractive varieties, unsurpassed for exhibition; and *The Shah*, deep crimson-purple with narrow edge of lilac, a very fine and beautiful variety.

Fancy *Pelargoniums* bloom, are dried off and cut down at the same time as the large-flowering varieties; and though cuttings of the former made from the ripened wood are put in at that time, the general method is to propagate by means of cuttings made of the young wood in spring. These are put singly into small pots of light sandy soil, or a few in a larger pot, and struck in a gentle bottom-heat, and then grown on in a cooler temperature. A successful cultivator and exhibitor of fancy *Pelargoniums* sets forth his cultural process as follows:—"The fancy *Pelargonium* may be grown to almost any size by keeping the house moist and warm, as the plants like a little warmth, but plenty of air should be given all day when it can be done, and the plants should have plenty of room, else the foliage becomes drawn. The peculiar character of the growth of the fancy *Pelargoniums*, close and dense, operates to crowd a specimen with shoots, therefore, in case of specimens, the outside branches should be tied out so as to afford room for the centre shoots to develop. In potting, the plants need to be kept higher in the pots than the large-flowering varieties, so that what is termed the 'collar' of the plants—that is the point where the main stem joins the roots—"be kept level with the surface of the mould. Great attention should be paid to watering. It is better to find six plants too dry than one too wet. There is a remedy for the first evil, but none for the latter, which often causes decay and death. The roots of the fancy *Pelargoniums* being of a much finer character than those of the more robust-growing, large-flowered varieties, cannot endure an excess of moisture."

FIG. 31.—FLOWERS OF AGAVE FRANZOSINI, FROM LA MORTOLA: COLOUR, GREENISH-YELLOW. (SEE P. 179.)

square, and is distributed in every direction through the park in open stone canals varying from 1 foot to 3 feet broad. The one I have mentioned, leading away from the high boundary-wall, is one of the largest, and is shaded on either side by good specimens of *Mimusops Eleni*, the flower of which is sacred.

Between this main entrance road and the elephant stables is a fine row of *Wellingtonias*.

The grass-roofed house in the shrubbery, on the borders of the lake, and close by a plantation of *Casuarinas* and *Mahogany* (the intention being to cut the former out when the latter have grown sufficiently strong), is chiefly filled with good-sized *Crotons* planted out. Water trickles through it in an open canal prettily edged with rockery, which is planted with Ferns, chiefly *Adiantum tenerum*. *Anthuriums*, *Philodendrons*, *Monstera deliciosa*, amongst other plants, are dotted about.

The *Crotons*, which occupy nearly the whole space of the house, are kept so that the young shoots may be struck for decorating purposes. It is found that *Crotons*, planted out, will live through the cold season under a grass roof, but those in pots require glass.

vegetable garden. All kinds are certainly good except Peas—these are scarcely up to the mark. Considering last season in England, I was not surprised. Cauliflowers, Turnips, Carrots, and Lettuces were quite as good as we get them. *Tuberoses* are also good. *James H. Veitch*.

(To be continued.)

FLORISTS' FLOWERS.

THE FANCY PELARGONIUM.

THE infrequency with which new varieties of fancy *Pelargoniums* are introduced is somewhat remarkable, when compared with the numbers of new large-flowering or show varieties announced from year to year. The latter are now produced much more sparingly than they were a few years ago, but scarcely a year passes without some being announced. One reason for this is seen in the fact, that the large-flowered *Pelargonium* admits of greater variation in colour than the fancy type; another is, that during

Fancy Pelargoniums requiring a warm and somewhat moist atmosphere, should have a small house to themselves to do them well. Those who grow for exhibition are able to supply this, but it cannot be done by those requiring plants simply for house decoration. A good compost for this plant is one made up of fresh fibry loam, well decomposed cow and stable manure, some leaf-mould and silver-sand, to which should be added a little peat and broken oyster-shells. As a rule, the fancy Pelargoniums will do well in a smaller pot than the large-flowering type, but much of course depends upon the size and vigour of the plants. *R. D.*

REMARKS ON THE FRUIT CROPS OF 1892.

[For Tabulated Summary, see p. 93.]

(Continued from p. 155.)

S. ENGLAND, S.W. AND W.

CORNWALL.—We have again a most disappointing fruit season about here. The Apple trees showed abundance of bloom, but in most places are thin, nothing like a crop, and Pears are still worse; they set very freely, but cold frosty nights have left us with few fruit. Peaches and Nectarines on open walls, without any protection, are the best crop I have seen for years, and the trees are making excellent growth. *James Murton, Pencalenick.*

— It is now about twenty years since I first had the privilege of reporting on the fruit crops for this district, and never have I given in a worse report than the present; 14° of frost was registered here on April 15. The warm days of the preceding week brought Plums, Pears, and Peaches, into full bloom, and nearly the whole were killed by the frost. It was so severe, that even beds of such hardy things as Radishes and Broccoli were frozen to death. *Chas. Lee, Boconnoc, Lostwithiel.*

DEVONSHIRE.—Apple crops in garden and orchard are much below average. A few sorts appear never to fail, such as Lord Suffield, Stirling Castle, Prince Albert; and a few others have fair crops in the orchard. Pears are an absolute failure. Plums not much better; the trees were in full bloom on Good Friday, when the frost (12°) cut all off. Strawberries are very good. Gooseberries and Currants could not be better. *Geo. Baker, Membland, near Plymouth.*

— In sheltered places the fruit crops may all be classed good. In open places, however, they are low average, and they are mostly of inferior size. This in great part is probably due to the unusual dryness of the year, the total rainfall for the first six months of the year being 9.42 inches only; while the protracted cold of the winter and spring-time was alike detrimental to the growth. *James Enstone, 38, Temple Road, Exeter.*

GLOUCESTER.—Apples are an average crop; the trees are not so infested with the grub as late years. Pears are very poor; most of the bloom was destroyed by the late spring frosts. Plums are an average crop, the culinary varieties requiring much thinning. Bush and other small fruits are very plentiful, but Nuts appear to be quite a failure. *A. Chapman, Weston Birt, Tetbury.*

— The prospect of an abundance of all kinds of fruit (except Raspberries) was never more cheering than was the case until April 26, when, after a fortnight of delightfully warm weather, the thermometer rapidly fell, and we had a heavy storm of hail, followed by two days of frost. On the 27th, 7° more was registered; on the 29th, 5° more; 30th, 8°; and May 1, 8° more; 2nd, 6° more; this was followed by more fine weather, but the damage was done. Pears, Plums, Apricots, and Cherries were ruined. The Apricots were as large as small Beans at the time of the frost, but quite shrivelled up. Apples were not far enough advanced for the buds to be injured generally, but in the case of D. T. Fish and Warner's King the buds were completely shrivelled up. They set quantities of fruit, which have since dropped off. I am of opinion this was due to imperfect flowers from unripened wood. The

trees are free from winter-moth. *Thos. Arnold, Cirencester House Gardens, Cirencester.*

HEREFORDSHIRE.—The spring frost played sad havoc with our fruit crops here, Apples and Pears on low-lying ground being almost a failure; but on the higher ground the crops are good. Plums came out of the ordeal better. Bush fruits very thin, but what are left are very fine. Strawberries a good, but not extra heavy, crop of poor quality. *John Watkins, Pomona Farm, Withington, Hereford.*

— The crops of Apples in this district are, on the whole, very good indeed, although the trees are not carrying such a weight of fruit as they at one time promised to do. The sharp frosts on the mornings of April 14, 15, 16, and 19 did a great deal of harm to Pears and Plums, with the result that the crop is a very light one. Some Plum trees in the neighbourhood growing upon the hill, and well above the fogs which gather in the valley, are bearing well, and Cherries are carrying unusually heavy crops. All bush fruits, Gooseberries excepted, are very abundant. *A. Ward, Stoke Edith Gardens, Hereford.*

— The Apples in this district are light generally, although some orchards have a fair crop; the quality promises to be very good. Pears the same. Plums are a fair crop, but the trees are very badly blighted. Strawberries have never recovered the severe winds and frost in the late spring. Gooseberries and Currants, though rather late, are of good quality. *Frank Harris, Eastnor Castle Gardens.*

MONMOUTHSHIRE.—Apples are a good average crop; King of the Pippins here still remains one of the most certain bearers. Pears blossomed freely, but were much injured by frosts, as were also Apricots and Plums. Dessert Cherries are good, but Morellos are somewhat thin, many fruits failing to stone. Currants, both black and red, together with Gooseberries, suffered slightly from frosts, and yet they are abundant. Raspberries carry fair crops, while Strawberries are enormously prolific, and their fruit is of excellent quality, both in size and flavour; Vicomtesse H. de Thury and President are amongst the best bearers; Noble, upon warm borders, is very useful for an early supply, and Waterloo, upon north borders, is also valuable for late use. *Thomas Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—All the Apple trees flowered very freely, but many of the flowers on some of them must have been injured before they opened, as they fell off in great quantities. The only Pears that escaped are against a wall with a north-east aspect. Cherries and Plums were badly damaged by frosts, but Peaches and Nectarines escaped marvellously well, and the Apricots on hottest walls are very abundant. Strawberries damaged both by late frosts and drought. *W. Iggulden, Marston Gardens, Frome.*

WORCESTERSHIRE.—The Apple crop is an extremely partial one, mainly owing to the fluctuating agencies of a wave of frost which swept through this district during the blooming period (18° in places with wet snow). Here and there trees are spared, and consequently well laden, whilst others almost adjoining, and of some kinds, are barren. A bad attack of the destructive Apple-blossom weevil, an insect which develops in the core of the fruit, caused the dropping off of many fruits. Apricots are the worst crop I ever remember, but Peaches and Nectarines flowering later escaped, and are good clean crops. Peach Waterloo was ripe on outside walls, July 10. Plums are good full crops, excepting the Gage family and a few other tender sorts. Damsons well laden, excepting those grown in damp low-lying districts. Bush fruits medium crops, and Strawberries heavy. *William Crump, Madresfield Court, Malvern.*

— The condition of the fruit crops in my district is very variable. All stone crops are good, Cherries and Peaches, and Nectarines exceptionally so. Plums in the open air a very heavy crop, but against east walls almost nil, which must be attributed to frost whilst the trees were in full bloom. Pears are a very short crop; and Apples are much under the average, excepting such kinds as Stirling Castle,

Duchess of Oldenburg and Ecklinville. Strawberries are very good, and other small fruits, except Gooseberries. *A. Young, Abberley Hall Gardens, Stourport.*

WORCESTERSHIRE.—Taken all round, the fruit crops with us are not so satisfactory as usual. Plums in many places are a very heavy crop, and in others extremely light; Pershore, Rivers' Prolific, and Victoria are the best. Pears are a very poor crop indeed. Apples are fairly plentiful; those carrying the best crops are Worcester Pearmain, Hawthornden, Warner's King, Greadier, Sturmer Pippin, Ribston Pippin, and Golden Reinette. Bush fruits are a very good crop, not having suffered from the spring frosts nearly so much as at one time anticipated. *Walter Child, Croome Court, Severn Stoke, Worcester.*

— Plum crop in this district on the whole is about an average; though some localities where Plums were heavy last year are very thin this year. Gooseberries are very scarce. Apples are a general failure. The season has been a trying one for the fruit crop. The cold spring, the continuous frosts, and the drought, so that it has been only the hardiest of common varieties that have withstood the test. *Joseph Masters, Evesham.*

— Apples and Pears are a very partial crop, and, taken on the whole, it is much below the average, although exceptions are to be found in a few sheltered orchards and individual trees, and some heavy crops are noticeable. We had apparently a good bloom, which was not spoiled to any extent by frost, but the individual flowers were, in a measure, ill-shapen, especially the stalks; there was also an absence of pollen and a want of vigour. The cause of this is probably due to the cold and sunless summer of last year, which prevented the wood from ripening. I attribute to this also the almost complete failure of the Apricot crop, and the more than usual death among the branches. We were gathering Apricots last year in the middle of October—nearly two months later than usual. Peaches and Nectarines, on well-drained borders and warm sites, are plentiful, and the trees healthy. Sweet Cherries are most abundant, but lack size. Bush fruits generally are good, with the exception of Gooseberries. Strawberries abundant and fine. *John Austen, Witley Court, Stourport.*

(To be continued.)

NURSERY NOTES.

LILIUM SPECIOSUM ALBUM NOVUM, AND L. S. MELPOMENE.

At the Orchid and Lily Nurseries of Mr. H. A. Tracy, Amyand Park Road, Twickenham, a good lot of these plants was recently in bloom, fully bearing out the grower's selection of them as the two best forms of *L. speciosum* for all purposes. Mr. Tracy grows Lilies largely for cutting, and he has had a large show of flowering plants for a considerable time past. The chief colour in *L. sp. Melpomene* is a rich crimson, whilst *L. s. album novum* is wholly white with yellow anthers, and by the colour of the anthers it may readily be distinguished from the inferior *L. s. Krätzerii*, which has chocolate-coloured anthers. Both of these forms have the usual fragrance of the species, and there can be no doubt as to their merits. Mr. Tracy says there is a difficulty in importing them true.

THE OLD NURSERIES, CHESHUNT.

The Cheshunt Roses are known all over the world, and notwithstanding the peculiarities of the season, and the large demands recently made on them for cut blooms, Messrs. Paul & Son's grounds show a very fine display. Many of the new Cheshunt hybrids are coming into bloom, and others, having stood the test of the severe trial they are here subjected to, are showing their good and distinct qualities. In testing a new Rose, Messrs. Paul try it simultaneously on the Manetti, on seedling Briar, and on Briars from cuttings; and, moreover, the trial plants are planted in different situations, so that the raisers may in due time form a fair opinion

of the merits of each. Of the recently passed, T. B. Haywood is a brilliant and distinct flower of a crimson-tinted scarlet hue, with the basal half of each petal richly tinged with maroon. Among the thousands from all raisers to be seen here, there is nothing like it or so brilliant. Mrs. Paul is another beauty of great size, of a blush-white, shaded with pink, and a Gold Medallist. Violet Queen is fine and distinct in colour; Bruce Findlay, a grand intensely bright crimson; and, among other fine hybrid perpetuals, Dowager Duchess of Marlborough, soft pure rose; Salamander, bright scarlet-crimson; Margaret Dickson, a grand white, with flesh-coloured centre; Madame Caroline Testout, like a rosy-salmon La France; the white La France, Augustine Guinoisseau, Duc d'Orleans, bright crimson; Gustave Figaneau, rosy-crimson; J. D. Pawle, a noble rich velvety-crimson, shaded with maroon; Marquis of Salisbury, fine crimson; Suzanne-Marie Rodocanachi, clear light rose; and that marvellously beautiful Mrs. John Lsing, were all of extraordinary merit, and would make a grand selection. Among the Teascented Roses, of which there is an immense quantity cultivated for planting, and also for growing in pots, Kaiserin Frederick, Elise Fugier, lemon white with a pink tinge; Innocente Pirola, light fawn; and climbing Perle des Jardins, were conspicuous.

Among decorative Roses, Paul's Cheshunt Scarlet is the nearest to scarlet of any Rose; Paul's single white and single crimson are two useful kinds, and Vivid is a brilliant pillar Rose.

But the most interesting of all the groups at the Old Nurseries, and the one which is getting increased attention, is that of the botanical species of Roses, and their very oldest garden forms, and of these Messrs. Paul & Son have been collectors and propagators for many years, making the undertaking a labour of love, even long before such plants came into notice with gardeners generally. In all the classes complete sets are to be found, the different species ranging from the pretty little *Rosa berberidifolia* to the huge *Rosa gigantea*, the new Indian Rose, which is said to have flowers nearly 6 inches across. Among this interesting class we noted the Sweet Briar Janet's Pride, with semi-double light rosy-crimson flowers with darker stripes; *Rosa Brunonis*, the Himalayan Briar; *Rosa rubrifolia*, with charmingly tinted red and silver leaves; *R. setigera*, the Prairie Rose, in two or three varieties; some hybrid *R. rugosa*, of which the double white *R. r. Madame G. Bruant* was the best; *R. indica*, Miss Lowe's Crimson, varieties of *R. polyantha*, the true York and Lancaster Rose; and *Rosa Mundi*, which generally does duty for it in gardens, although quite a different thing.

Leaving the Roses, and glancing at the other fine hardy trees and shrubs, we have an opportunity to compare the old *Acer negundo variegata* with the *A. n. robusta*, which is evidently a hardier and a freer-growing variety; and also with *A. negundo aurea*, which is certainly a desirable plant where coloured foliage is wanted.

Passing to the pretty nook known as the golden garden, we find an admirable effect made by a circular bed of *Taxus elegantissima aurea*, arranged with golden Irish and English Yews, the first named being much the brightest. *Ulmus Van Houttei* also has yellow foliage, and the golden Alder and the other plants in this pretty little garden all have leaves of a more or less yellow tint; but the admirable arrangement secures a good effect.

Large-flowered Cannas are much cultivated at Cheshunt, and Mr. Geo. Paul shows with pride a quantity of home-raised seedlings, which, in addition to having the fine flowers and rich colours of the older forms, are of a very dwarf habit, the whole plant when in flower being in some cases not more than 1 foot in height. Should they retain that dwarf habit, they will be eagerly sought after. Among proved kinds in flower, *Canna Alphonse Bouvier* has large blood-red flowers, Ulrich Brunner, orange-tinted scarlet; *Petite Jeanne*, scarlet-edged yellow; *President Carnot*, crimson; *Professor David*, yellow, speckled red; *Miss Sarah Hill*, a fine glowing

crimson; and *Admiral Courbet*, yellow, with dark spotted centre.

In the houses we found a large quantity of the Cheshunt strain of *Amaryllis* or *Hippeastrum*, in which it is sought to retain as many flowers on a scape as in some of the old species, and improve them in form and size; a fine batch of seedling *Disa grandiflora*, with some new tints among those in flower; a quantity of the best varieties of *Cœlogyne cristata* and *Cypripedium insigne*, thriving in various situations; a good lot of the pure white *Agapanthus umbellatus albus*; *Schubertia graveolens*, flowering freely; and also the pretty *Bomarea Lehmanni* and *B. Carderi*. *Garrya elliptica* perfects its seeds under glass, and the seedlings come up freely; and house after house of grand Tea Roses in pots is worthy special attention. Messrs. Paul & Son also have a good selection of hardy perennials and alpine plants.

P. McARTHUR'S NURSERY, MAIDA VALE, LONDON, W.

This establishment contains many very interesting and rare Orchids, and although there are many miscellaneous plants, this family forms by far the most noticeable feature of the place. Just now there are some very fine and distinct forms of *Odontoglossum Harryanum*, one of them has large and richly-coloured flowers, a peculiarity of which is, that it expands the petals in the same manner as the sepals. One very light-coloured variety has the marking of the lip of lavender-blue, and another has a reddish-purple coloured lip, very different to the decided blue of the ordinary forms. All the *Odontoglossums* are in exceptionally good health, and are making fine, strong, clean growths. It is rarely we have seen them so happy.

Amongst a large number of *Dendrobiums* is a good batch of *D. Brymerianum*, the better form of some with shorter pseudobulbs, and better flowers than the common type; and in this house we noticed several plants of the exceedingly rare *Grammatophyllum Ellisii*, a good number of *Odontoglossum Inseleyii*, and some very healthy specimens of what is supposed to be a new plant, and which somewhat resembles *Eulophia scripta*. Some semi-established plants of *Cypripedium Chamberlainianum*, and a good group of *Odontoglossum Roezlii* are likewise healthy and vigorous. Of the *Cypripediums* we noticed some good plants of *C. Harrisonianum*, *C. superbiens*, *C. concolor*, *C. ciliolare*, *C. callosum*, *C. Haynaldianum*, and *C. Godefroye*. A little importation of a distinct type of this latter variety are showing some very fine forms. *Vanda Sanderiana* is represented by a few first-class specimens, and amongst some *Dendrobiums*, *Phalænopsis Schroderianum* is a variety which bore flowers nearly white on the last occasion. This plant is now showing two spikes from the apex of a fine healthy growth. A large number of the true *Cattleya labiata* are established in baskets suspended from the roof, and there are also many other varieties of *Cattleya* in very fair condition. *Lælia xanthina*, although introduced in 1859, has never become very popular; but here we noticed a plant bearing very attractive flowers, the lip being more distinct than the type, and almost white. The sepals and petals were a soft canary-yellow colour. In another house were some good plants of *Cœlogyne cristata*, *C. c. alba*, *C. c. Lemoineana*, and *C. c. maxima*, also a fine large pot of *Cymbidium Lowianum*.

Miscellaneous Plants.—There are several houses devoted to various stove and greenhouse plants, including Palms, *Eucalyptus*, *Acacias*, *Liliums*, *Pelargoniums*, &c. The *Pelargoniums* obtain in much variety, and the French varieties of the zonal section are especially well represented. There are also some varieties that are especially recommended for bedding, one of the best of which is *Souvenir de Mirande*, with salmon and white flowers, a pretty and effective plant. There is also a good collection of *Carnations*, some of the seedlings being very meritorious. Mr. McArthur has some more ground and glass at Hanwell, and in the Harrow Road, W., where he grows many hundreds

of the *Euonymus*, both gold and green varieties, Ivy-leaved *Pelargoniums*, *Ampelopsis*, &c. From 2000 to 3000 *Chrysanthemums* are grown, and these are now looking in the very best condition.

INDIA.

CALCUTTA.

THE annual report of the Royal Botanic Garden shows that a large amount of earthwork has been done, consequent on the improvement of the roads. The abnormally dry season proved detrimental to many of the plants. Dr. Prain has, during the year, explored the flora of some of the Andamans previously unvisited, and also visited Chota Nagpur and the Jaintea Hills [Khasia] with the same objects. Other collectors have been at work in Tenneserim, Tavoy, Mergui, the Naga Hills, the Lushai frontier, and other places, so that substantial additions to our knowledge of the Indian flora may be anticipated. The publications of Dr. King and of Dr. Prain have previously been noted in these columns.

THE ROSERY.

WE take the following particulars from the *American Florist*, which has been interviewing Mr. Hugh Dickson. Asked, "What advantage do you claim for budded over own-root stock?" Mr. Dickson replies:—

"Immediate effect. The purchasing public gets from budded stock as much bloom in two years as will repay the whole outlay; whereas with own-root stock, you must wait two years before the plant is any size. You must not confound Roses properly budded low down on Manetti stock with the stuff budded high on the stem, which is sent over here from Holland for auction sales. We exercise great care in the preparation of our stocks. First, we cut the wood into lengths of about 12 inches, and cut out all the eyes from the base up, leaving only three at the top to grow. These are then planted, and after a twelvemonth's growth we lift them, cut off all the rootlets that may be up the stem, also cut back the roots at the base so that they will break away again and become bushy, and plant about 4 inches deep. Then when we come to bud, we scrape out all the soil from around the roots, and bud close down. The following spring, say, in March, after the bud has started, we cut off the top of the stock, and mould the plants up slightly. In this way we often get our Roses not only with the roots of the stock but with own roots as well. If budded stock is planted deep, you are liable and likely to have them doubly rooted. In addition to the hot suns, which are against your Roses in outdoor culture, I find you suffer a great deal more from insect scourges than we do."

"About your hybridising: what are you doing, and what are you aiming for?"

"Well, we know that if we can only strike a yellow Tea of good substance and colour, it will be a ten strike for the American trade alone, so you will understand that this is one thing we are striving hard for. In our early trials, we used *Gloire de Dijon* considerably, but have found since that it is useless as a parent, for no matter what the other parent may be, the *Dijon* blood is most manifest. It may interest you to know that the result of one cross between *Dijon* and *Perle* was a purplish-red. In crossing two Roses of sweetest fragrance, we often in the progeny get a Rose without a vestige of perfume."

"How do you account for this?"

"Don't know how to account for it; and would like to meet the man who can."

"Will you make any exhibit at Chicago next year?"

"Yes; we sent over last February, in compliance with Mr. Thorpe's request, a lot of 1200 Roses, largely our own seedlings."

BOOK NOTICE.

THE CARNATION MANUAL.

Messrs. Cassell & Co. have issued for the National Carnation and Picotee Society (Southern Section) a little book dealing with the Carnation in its cultural aspects. Seed-sowing, propagation, and general culture are all treated of, and special sections are devoted to the border Carnations (the most beautiful of all), exhibition Carnations (to which some people would apply exactly the reverse epithet), dressing the Carnation, diseases and pests, and a great variety of miscellaneous but strictly relevant information. The book is edited by Mr. Martin Smith, the President, and Mr. James Douglas, the Secretary; and may be had free by all members of the Society subscribing 10s. The Rev. J. D. Horner furnishes a sympathetic introduction. Mr. Douglas begins at the beginning with seeds and seedlings. Mr. R. Dean follows on with their propagation. Mr. Martin Smith discusses on border Carnations, and Mr. Robinson on Carnations in the flower garden. Mr. Martin Smith also gives a calendar of operations for every month in the year. Mr. Rowan, in speaking of "dressing" the flower, recommends it, by implication at least, as showing the individual types of the flowers. This is exactly what it does not do, in our opinion. It would surely be possible to cater for the ordinary flower-lover on the lines indicated in the present volume by Mr. Burbidge, as well as for the "florist," and to do away with the very un-gardener-like process of "dressing," except under vigorously defined limitations. Let the cultivation be as perfect as we can make it, but let us discard all meretricious procedures as derogatory to the flower, and unworthy of the gardener. However, it is a matter for great thankfulness to have got rid of the paper collar for the pot plants, and this little concession bids us hope that Nature will be allowed to have her own way in other points also. The great development of the culture of the border Carnations, and of the yellow-ground varieties, are also healthy signs. The sections on the tree or winter-flowering Carnations by Messrs. Harry Turner, J. Jennings, and Douglas will be read with great interest. We could wish these gentlemen would discountenance the excessive size now fashionable in Malmaisons. We heartily commend this little volume as containing excellent information for the cultivator, and just that amount of variety in matters of taste and individual fancy which secures even a florist's flower from monotony.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By R. MILNER, *Gardener, Penrice Castle, Swansea.*

GLORIOSAS.—Pay regular attention to the training of the young growths of these plants as they extend, and any that have filled their pots with roots should be assisted with weak manure-water occasionally. Plants which started early and are now out of bloom, and that have been standing in a cool house, should be removed to the stove, and the necessary amount of water afforded them, to preserve the foliage fresh as long as possible, afterwards gradually drying off, so as to prepare the bulbs for their resting season.

FLOWERING STOVE PLANTS.—Such plants as *Allamanda*, *Ixoras*, *Stephanotis*, *Clerodendrons*, &c., can be removed from the stove when in flower, to embellish the conservatory or greenhouse during the next two months, without any risk of the plants being injured. During this season of the year flowering plants are not so plentiful as is generally the case in spring and early summer. Choose the warmest positions for these plants, and avoid draughts as much as possible; and whilst occupying a cooler temperature, the plants will not require so much water at the roots as previously. Give the necessary amount of shade, to prevent the leaves being injured by bright sun.

CONSERVATORY AND GREENHOUSE.—Plants occupying these houses should be re-arranged fre-

quently, and all plants which are past, taken out, which will afford room for fresh supplies from reserve pits of such plants as *Mignonette*, *Heliotrope*, zonal *Pelargoniums*, *Fuchsias*, *Celosias*, *Gloxinias*, tuberous *Begonias*, *Tuberoses*, *Coleus*, with a few *Ferns*, and small *Palms*. Regulate the growth of all creepers, and thin out any which are getting too crowded, also be careful to afford plenty of water to the roots, especially during bright weather.

EPHIPHYLLUMS.—The different varieties of the above which bloomed early in the spring, will have completed their growth. The larger-growing varieties may be stood outside on a bed of coal-ashes at the foot of a south wall, securing the shoots to the same, and giving them just sufficient water to keep the growth from shrivelling, which will then become thoroughly matured. Plants which were kept cool to flower late, will now be making their growth; give them a light position in the greenhouse, where they will be fully exposed to the sun, and they may have sufficient water at the roots to keep them growing freely, until this is completed, afterwards keep them dry at the roots, to thoroughly ripen the wood.

Epiphyllum truncatum.—This section will have completed their growth, and the shoots will be plump and firm; place them in a sunny position in the open, either on boards or coal-ashes, if the weather keeps bright and sunny, but failing this the most suitable place for them would be a cold frame or pit. Remove the lights altogether when the weather is bright.

FORESTRY.

By J. E. WEBSTER, *Fairview, Stangmore, Dungeness.*

SEASONABLE WORK FOR AUGUST.—This is the best time to sort and prune young hard-wooded trees generally, but more especially the kinds that are apt to bleed at the wounds where branches have been cut off at an earlier period of the season, as the wounds inflicted at present will soon cicatrise and heal up without any injurious effect. Trees that have been well managed in the early stages of their growth seldom require much pruning in after years, so that this operation is reduced to the removal of double leaders at the top, and to cutting back rambling side branches in order to form a well-balanced top, and lessen the risk of fracture by wind. The removal of large branches is not to be recommended, but in cases where it becomes desirable, the surface of the wound had better be made smooth with a sharp knife, and then coated over with paint the same colour as the bark of the tree. This will not only improve the appearance, but likewise promote the healing processes, and prevent the lodgment of water to lay the foundation for rot and decay. I need hardly say that wounds of all sizes should have a smooth sloping surface, and in the removal of superfluous leaders at the top, the pruning chisel attached to a shuft is a very suitable implement, as it makes a clean sloping wound which soon heals up. Young trees that have been cut over or damaged by hares and rabbits are now producing several suckers from the base of the stem; these should be cut over, leaving the best and most centred to form the stem of the future tree.

Hedges of all shapes and sizes should now be pruned, to keep them in proper shape, and promote the formation of a close, durable, and efficient fence. I have had this work done for many years by contract, at an average rate of from 1*d.* to 1½*d.* per perch of 5½ lineal yards. In the hands of a practised workman the hedge-knife or switcher is the most efficient tool. Young hedges should have all weeds removed at the same time, and the surface broken up, to admit air and promote the growth of the plants. When the trees are in full leaf, advantage should be taken of this to mark such as it is desirable to remove in autumn to open up vistas here and there to improve woodland scenery. This sort of work should be thoroughly studied from different points of view on the principal roads and drives, and in some cases from the windows of the mansion before the axe is laid to the root of a single tree, otherwise mistakes might occur which will take an ordinary lifetime to see them rectified. This is also a proper time to mark off the sites for standard ornamental trees to be planted here and there for the embellishment of the park or lawn. The spots should be well trenched and broken up before planting, and in cases where the soil is of a poor, thin character, a little extra soil should be added to improve its texture and give the trees a good start. In the execution of this sort of work the planter should be well acquainted with the probable size, contour, and tints

of foliage, which the different species of trees exhibit to view after they become established, by which means he will be enabled to plant them in such a way as to show contrast and variety. In cases where it is desirable to plant groups of ornamental trees, plants of an average size should be planted at a distance of about 35 feet. The space between these trees may be planted with trees and shrubs to form a covert, but in after years they must be thinned out as the circumstances of the case may direct. In the formation of these plantations care should be taken not to plant any of the trees in too close proximity to the sides of walks, drives, or roads, where they may prove too large for the situation. Trench and prepare the ground to be planted with Evergreens in early autumn both for ornament and covert; also a piece of ground of a sandy texture, on a northern exposure, to be planted with cuttings of Laurels, Yew, Box, Privet, and other kinds of Evergreens usually propagated in that way. These may be inserted about the end of the month or beginning of September. When the haws of the White Thorn exhibit a brown-russet colour, they may be gathered and sown at once on rich soil formed into beds 4 feet wide. One bushel of seed is sufficient to sow 20 lineal yards of a bed the above size. The haws should be sown in an even and uniform manner, and pressed down on the surface with the back of a spade or light roller, and covered with about half-an-inch in depth of fine soil. When treated in this way the plant generally appears above-ground next season, by which means there is a saving of time and expense, as compared with keeping the haws over a twelvemonth in rot-heaps. The berries of the Mountain Ash, Holly, Hawthorn, &c., that were gathered last year, and are at present in the rot-heap, should be turned to promote the even and uniform decomposition of the rind. Finish the budding of ornamental trees, and loosen the ties used to secure buds that were inserted last month where requisite. Examine, untie, and sort grafts as the circumstances of the case may suggest. Rub off superfluous buds and growths in order to direct the whole energy of the plant to the formation of wood in the scion. In damp cloudy weather, Evergreens may be transplanted about the end of the month; the natural heat in the ground at that season promotes the formation of fresh fibres, so that the plants become established in the ground by the approach of winter. In places where the ground consists principally of hard inorganic material, it is a good plan to mix a little bog-earth or leaf-mould with the soil where the plants are to be inserted.

FRUITS UNDER GLASS.

By J. RIDDELL, *Gardener, Castle Howard, York.*

STRAWBERRIES.—Any plants still unpotted should be taken in hand as early as possible; good growth and well-ripened crowns will then be obtained in autumn. Stand the pots close together, in order that one may shade the other from the sun's influence; and, as growth advances, and the plants are able to protect their own pots, they may be stood well apart, that air can have free play among the foliage.

MELONS.—The latest batch of Melons are now showing female flowers, and their fertilisation should be attended to daily. At this stage keep the atmosphere of the houses or pits a little dryer, and admit a little air by the bottom ventilators, but as soon as a set is secured, give a good surfacing to the root-medium, well saturate the whole with liquid-manure, and again maintain a moist air within the structure. Plants carrying fruits that are now swelling may be liberally fed, and unnecessary growths should be suppressed by rubbing them off whenever they appear in the axils of the leaves. After a few days of dull weather, afford abundance of moisture to the roots and stems of the plants when bright sunny days return. Melons ripening should have abundance of air admitted to them on all favourable occasions, and as little water as possible should be used in the house if the varieties are subject to cracking. A high temperature and a moisture-laden atmosphere favour this evil, and the practice of shutting up the house early in the afternoon with a view of husbanding sun-heat must give place to that of reducing the air by degrees. In cases where insect pests necessitate the use of the syringe on these plants, early morning ought to be chosen for such work, and an effort be made to get the foliage dry before the day is far advanced.

SAVING SEED.—Always select seed from the best fruit, avoiding all of bad form or small size. It is

also desirable to know if the fertilisation has been effected by flowers of the same variety, as carelessness in this matter not unfrequently proves a source of disappointment the following year. The seeds should be washed in water, and all those that float on the surface, and all the pulpy matter, should be thrown away, only retaining those that sink. These may be dried and put in packets, legibly labelled and dated, and then placed in the seed-room for future use.

THE APIARY.

By EXPERT.

CLEARING UP.—Except in Heather districts, the season of 1892 has come to an end. Sections remaining on the hives should be removed at as early a date as possible, and those that are not completed, passed through the extractor. They may then be given back to the bees to clear out any remaining honey, after which they can be put away for another year. The sooner all extracting is completed the better, as a little later, after the nights begin to get cold, the honey thickens so much that it does not leave the combs properly. The best time of day now to remove honey from the hives, or to perform any manipulation, is in the evening, and great care should be taken not to leave any sweets about, or robbing will be started; and this, when once begun, is difficult to suppress, besides the danger of exciting the bees so much that they become a nuisance to neighbours and others. Should robbing be inadvertently started, a free use of the carbolic solution is the best remedy, and this should be sprinkled on the alighting boards, or a cloth saturated with it be hung over the hive entrances. The carbolic cloth is far more useful than the smoker at this season, and beekeepers who get into the way of using the former will rarely want the latter at any time.

RESULTS OF THE SEASON.—The season appears to have been a disastrous one, judging from reports in Scotland, and as far south as Yorkshire the weather has been so unpropitious that bees have had to be kept alive by artificial feeding at the time when honey should have been freely collected. Good takes have been the rule in Kent, Essex, &c., and the quality of the honey has been all that could be desired.

A NEW SEPARATOR.—A year or two back the writer discovered, quite by accident, that more perfect sections could be produced by the use of separators made of ordinary perforated zinc, and many inquiries were instituted amongst leading beekeepers as to whether any one had previously tried or experimented in this direction, but with a negative result. This year has proved conclusively that where perforated zinc has been used, a marked difference can be observed in the sections. They have been invariably better filled, and more completely capped, and the apparent reason is that the bees are better able to maintain the necessary heat when they are wax building at the edges of the sections, as they are able to form a cluster there almost as well as if a separator was non-existent.

THE FLOWER GARDEN.

By H. W. WARD, Gardener, Longford Castle, Salisbury.

RAISING PLANTS FOR SPRING FLOWERING.—This is a suitable time for sowing seeds of *Saponaria calabrica*, *Candytuft*, *Silene pendula*, including *S. p. compacta*, *Linaria bipartita*, *Escheholtzia*, *Limnanthes Douglasi*, *Godetias* in variety, *Nemophilas*, and *Sanvitalia procumbens*. Sow the seeds of these various plants thinly in drills of about half an inch deep and 6 inches apart on nicely prepared beds, afterwards treading the drills and raking the ground level. A south or west border is the best place for the beds, and by sowing thinly, no after-thinning of the seedlings will be needed. The beds of *Daisies*, *Wallflowers*, *Pansies*, *Primroses*, *Myosotis*, &c., in the reserve garden should be weeded and watered when necessary, and should the stock of *Pansies* and *Violas* be less than the requirements, it may yet be increased by division. *Violas* are not only useful and showy spring flowers, but they are just as effective in summer. We employ *Golden Gem* and *Blue Perfection Violas* with excellent effect, mixed with *Bijou*, *Manglesi variegatum* and golden-bronze *Pelargoniums*. When the *Pelargoniums* are cleared away, these *Violas* remain, and make a fairly good display during the later autumn months and in early winter, which increases in beauty as the spring approaches. The tuberous-rooted *Begonia* increases in popularity as a summer bedding plant,

and by saving seed from the finest flowers every year, sowing it early in January, and growing the plants on, and again weeding-out the least handsome flowers, a good strain is secured. Plants of two and three years old which produce fine masses of foliage and flowers, the latter having broad stout petals, should be selected as the seed-parents. The double-flowered varieties also gain in favour as bedders and pot-plants. They are even better wet-weather flowers than the singles. Planted either in mixed or separate colours in beds ranging in size from 3 feet to 10 feet in diameter, the effect is very telling and in every way satisfactory.

PROPAGATION.—There are now plenty of *Pelargonium* cuttings to be had, and propagation should be completed as soon as possible, that is, when it can be done without interfering with the desired shape and beauty of the beds. The cuttings should have two or three joints, and be cut square across a little below the bottom one; they will do very well if dibbled into shallow boxes, filled with light mould, and having a surfacing of silver sand. Put in the cuttings about 2 inches apart, making the soil firm about them; water through a roset-can, and then place the boxes in a dry situation and fully exposed to the sun, on strips of board, slate, &c., to keep them off the ground. Sprinkle them lightly in the afternoon of each day when it has been bright and warm. The boxes should be made the same size for the convenience of storing and economising house space—say 2 feet long, 9 inches wide, and 4 inches deep (inside measurement), and they should be provided with five or six half-inch circular holes in the bottom for drainage, these being covered with a few pieces of potsherds, followed by a handful or two of half-rotted leaves before filling them with soil. Cuttings of *Lobelia*, *Verbena*, *Alternanthera*, *Mesembryanthemum*, *Heliotrope*, *Ageratum*, and *Salvia*, dibbled into 6 or 4½-inch pots, filled as recommended above, watered, and then stood on sifted coal-ashes in a frame or pit near to the glass, affording shade during the heat of the day, will soon form roots. The shading may then be dispensed with, and an increase in the admission of fresh air be gradually made to insure a sturdy consolidated growth in the plants, without which these "stock" plants, i.e., plants from which the necessary stock of the kinds indicated, as well as their several varieties, for filling the flower-beds and borders the following May and June, are to be propagated next February, March, and April.

GENERAL WORK.—This will consist in mowing, and cutting the grass verges with shears, and brushing up same, weeding and rolling of walks, trimming of hedges, and the cutting into shape with the knife *Evergreens* of various kinds requiring attention in this direction.

THE KITCHEN GARDEN.

By G. WYTHE, Gardener, Syon House, Brentford.

ASPARAGUS.—This vegetable is frequently overlooked after the summer cutting ceases, but to get large growths it is necessary to assist the roots in dry hot weather so that there is no premature ripening of growth. On dry light soils irrigation is most beneficial, and if a dressing of fish manure or salt is given previously to applying the moisture, it will help them considerably to yield a greater weight of grass next season. Where it is required to force beds in their permanent quarters, no time should be lost in giving this assistance; and if the beds are raised or made up for forcing, more moisture will be necessary. A good dressing of cow manure placed on the surface will do much good on light sandy soils, especially to beds cut very late.

SEAKALE should receive attention in the way of feeding on dry soils, giving salt or fish manure, and a good flooding with a hose when possible, removing the flower stalks as they appear, and restricting the growth to one strong crown. This plant luxuriates in good loam with a cool bottom, therefore on sandy soil it requires much moisture. Dressings of soot and salt will do much good, also frequent supplies of liquid manure.

CELERIAC requires similar attention in the way of moisture and feeding, and the suckers should be removed when they form round the roots, so as to throw all the strength into the main root.

CARDOONS also require plenty of water to secure a large succulent growth by the autumn, and the tops a few loose ties to prevent the wind breaking them.

CELERY.—No time should be lost in getting the latest crop planted out, and if the seed was sown very thin, as advised, transplanting will be an easy matter; the plants being sturdy will lift readily, and not flag during the operation. The trenches should be well prepared previous to planting, and the soil well saturated the day before. Deep trenches are not necessary for the latest crop; good land, well drilled, will be quite sufficient. The earlier-planted lot will now require abundant supplies of moisture, but I should not advise earthing-up too soon. If required early in the season, a small quantity of earth should be placed around the roots of early rows to give the first supplies, as when a large body of soil is placed around the stems too soon, it smothers the tender growth, and often causes decay. A free growth, well matured with liberal waterings and supplies of liquid or fish manure, will be better than premature earthing-up. This latter work is readily done later, when a robust growth has been secured.

TOMATOS.—Frequent stopping and thinning of the shoots will now be necessary to encourage the swelling of the fruits, and to admit all the sun and light, endeavouring to get as much fruit set as possible during the early part of the month. Any set after that period may not have time to mature. If planted in shallow borders, more feeding and moisture will be necessary; but, unless the root space is restricted, manures given in quantity cause too much leaf growth. Plants against walls should have close attention in watering and nailing, restricting the growth to a few leading shoots. The cordon system is, perhaps, the best. Cuttings struck now from healthy plants will come in useful for early crops next spring. They strike readily in a light compost if taken off with a heel.

THE HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener, Mereworth Castle, Maidstone.

ORCHARDS.—Only quite recently I have had the opportunity of seeing some scores of acres of fruit plantations, and although at one time the crop of Apples seemed somewhat disheartening, there is more fruit than we at that time anticipated. The trees are greatly in need of a thorough soaking of water, the soil about the roots being very dry. Where the trees are bearing heavy crops, and the fruits are of marketable size, no time should be lost in thinning the number; the rest of the crop left to mature will then be of better size, and the trees also able to form buds sufficiently strong for the production of a satisfactory crop next year. Mulching and watering with liquid manure should not be neglected. Large trees of *Blenheim Orange* are bearing good crops, and of the younger trees, *Worcester Pearmain*, *Manks' Codlin*, *Lord Grosvenor*, *Lord Derby*, *Old Nonsuch*, *Yorkshire Beauty*, *King of the Pippin*, *Knobs*, &c., are also bearing satisfactorily. Young trees planted late in spring must be watered, especially on light soils, and on soils which have a tendency for cracking, for if not kept fairly moist, the leaves will drop prematurely. Soil that has been baked hard with sunshine following a heavy rain, should be slightly loosened with a fork previous to applying water, after which cover up with dry soil, or mulch with manure, grass from mowing-machines, or any thing at hand to preserve moisture at the roots.

NUTS.—From these bushes all suckers should be removed forthwith, and the young shoots shortened back to within 8 inches of the base. Keep an eye on all young trees, preserving such shoots as may be required for the formation of the future bush, which should be that of the vase shape. Do not allow any weeds to remain, but keep the hoe constantly in use.

STRAWBERRY PLANTS.—Lose no time in planting-out any young plants that are expected to fruit next year. See that the balls of soil are thoroughly moistened previous to turning them out of the pots, slightly disentangle the side roots with a pointed stick should they have got pot-bound, and plant very firmly on deeply worked soil of good tilth and heart. In making new plantations, they may be put at 1 foot apart from plant to plant in the rows, every alternate one to be removed after the first year's fruiting. All the plants should be well matured after the planting is finished, so as to settle the soil about the roots. Self-rooted runners between the rows may be lifted with care and planted in nursery beds at 10 inches apart, to be removed to their allotted quarters next spring, but these will not fruit well the first year; consequently, the weak flower-spikes should be removed as they appear, the plants will then build up good crowns, and fruit heavily the following season.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see. Advertisements should not be sent to the Editor, but to the Publisher.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

WEDNESDAY, AUG. 17.	} Shrewsbury Great Floral Fête (two days). { Cardiff Horticultural (two days).
THURSDAY, AUG. 18.	
FRIDAY, AUG. 19.	} Devon and Exeter Horticultural. { National Co-operative at the Crystal Palace.
SATURDAY, AUG. 20.	

MEETING.

THURSDAY, AUG. 18.	} Brighton and Hove Chrysanthemum Society. { Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms, at 12.30.
FRIDAY, AUG. 19.	

SALE.

FRIDAY, AUG. 19.	} Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms, at 12.30.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—62°·1.

THE ordinary Tuesday meeting was of the customary interesting character, though, as was natural at this season, somewhat less extensive and less well attended than usual. In another column we give a full report of the meeting, but here we may note the excellent way in which Mr. CANNELL set up his Begonias, a lesson which we hope rosarians and florist flower exhibitors generally, will duly take to heart. As Mr. CANNELL showed his flowers, it cannot be said that comparison between one flower and another was at all more difficult than when flowers are throtted on a board. Mr. WATERER'S *Lilium Parkmanni* × has not been seen for many years, but as now seen it hardly redeems its earlier promise. Mr. WYTHES' exhibit of *Campanula pyramidalis* surrounded by dwarfier growing varieties of the same genus was very beautiful. Orchids were numerous, interesting, and beautiful. Among them was a remarkable deep violet-coloured *Calanthe* from New Guinea, shown by Messrs. SANDER & Co., quite different from anything of the kind in cultivation, and one whose merits Orchid growers will be sure to appreciate shortly, though the critics were unaccountably chary in their approbation on this occasion. Mr. FARNHAM showed a hybrid *Sarracenia* between *S. Drummondii* and *S. rubra*, of a very rich crimson, tessellated with white. Figs in great variety, from the Society's garden; Peas and Peaches, Melons and Marrows, were among the exhibits. The paper at the 3 o'clock meeting was from the pen of a veteran *Fuchsia* grower—one conversant with the *Fuchsia* as it was in the first quarter of the century, and one who has taken no small share in making the *Fuchsia* what it now is. It was a strange oversight, therefore, that not a species nor a variety of *Fuchsia* was shown, if we except a few specimen illustrations shown in illustration of the lecture, and thus an opportunity of attracting great interest on the part of the public, and of affording a most useful object-lesson alike to the cultivator and to the naturalist, was lost.

A Silver Wedding.

A SILVER WEDDING is an event of so private—we might almost say so sacred—a character, that to speak of it *coram publico* is in general a desecration. There are, however, occasions when the public may rightly be taken into confidence, and where the position of the parties chiefly interested is such, that the public will not be denied from expressing their feelings, and adding their congratulations to those of the family circle. Mr. and Mrs. HARRY VEITCH find themselves in that position. We can well believe that they would have preferred that the event should have been celebrated in the purely domestic fashion, which under ordinary circumstances, English folk prefer. If we feel some hesitation on the score of intrusion into domestic affairs, there are circumstances which have forced us to overcome it in the general interests of horticulture. The name of VEITCH has become a household word, not only in its strict significance, but in the wider world of horticulture, and hence it is that we feel we need not offer any apology for intruding what would otherwise be a private matter upon the notice of our readers. The employés of the firm, the gardeners of the United Kingdom, business friends, the committee of the Gardeners' Royal Benevolent Institution, representative Belgian and French committees, and various local religious and charitable societies availed themselves of the opportunity of testifying their regard by the presentation of gifts, more to be appreciated for the sentiment they convey than for their intrinsic value. There is another circumstance that compels the Press to take note of the occasion; at any rate, the Press would not be doing its duty if it did not express the thankfulness of its constituents at the nobly appropriate way in which Mr. and Mrs. HARRY VEITCH have themselves commemorated the occasion. A thanksgiving donation on their parts of £500 to the Gardeners' Royal Benevolent Institution, of a like sum to the Gardeners' Orphan Fund, and of £100 to the United Horticultural Benefit and Provident Society, forms a remembrance of a most enduring character.

The respect and good feeling of horticulturists will doubtless be appreciated at their proper value, but the consciousness of good done to the helpless orphans and infirm gardeners will, we are sure, constitute a yet greater source of satisfaction to the donors. We can but wish that they may be permitted to celebrate their golden jubilee with the like pleasing ceremonial!

Buddleia Colvillei.—For the specimen whence our illustration was taken (fig. 32), we are indebted to Mr. W. E. GUMBLETON, in whose interesting garden at Belgrove, Queenstown, the plant lately flowered. Mr. GUMBLETON, a critical judge, speaks in no measured terms of its beauty. The shrub is a native of Sikkim Himalaya, at elevations of 9000 to 12,000 feet, and is figured in Sir JOSEPH HOOKER'S *Illustrations of Himalayan plants*, t. 18 (1855). Mr. GUMBLETON'S plant is much less like an *Escallonia* than is the representation above cited, based on Sir JOSEPH'S drawing of the native plant. The form is slightly different, and the colour is less distinctly crimson. When young, the leaves are covered with rust-coloured down on the under-surface. The plant is also described by Mr. C. B. CLARKE in HOOKER'S *Flora of British India*, vol. iv. (1855), p. 81.

GARDENERS' ORPHAN FUND AND GARDENERS' BENEVOLENT INSTITUTION.—Through the kindness of Mr. and Mrs. JNO. FIELDEN, the gardens and

grounds at Grimston Park, Tadcaster, will be open to the public at a charge of 1s. each on Wednesday, August 17, 1892; the proceeds to go to these two deserving societies. An interesting cricket match has been arranged, and a good band will attend. Donations and subscriptions to the above funds will be gladly received by E. HARRISON, Esq., The Croft, Kirkly Wharfe, Hon. Treasurer, or by Mr. H. J. CLAYTON, gardener at Grimston, Hon. local Sec.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We have much pleasure in announcing that the Right Hon. Lord BRASSEY, K.C.B., has consented to preside at the fifty-third anniversary festival of this important charity. The dinner, which was unavoidably postponed, owing to the lamented death of Lady GOLDSMID, will take place at the Hôtel Métropole on a date to be fixed in November next. Gentlemen who are interested in the welfare and progress of the Institution are invited to act as stewards on the occasion, and should communicate with the Secretary, GEORGE J. INGRAM, at 50, Parliament Street, London, S.W., who will gladly respond to any inquiries that may be addressed to him. We have also to announce that Mr. ARTHUR VEITCH has been elected a member of the committee in the place of Mr. JOHN FRASER, who is retiring after many years of zealous service for the Institution.

HOLLINWOOD BOTANISTS' GARDEN.—The *Journal of the Oldham Microscopical Society and Field Club* contains, according to the *Oldham Standard*, an interesting account of a recent visit the members paid to the Botanists' Garden, Hollinwood. The visit was paid for the purpose of seeing what had been accomplished by the botanists of that district during the last half-dozen years in the way of cultivating British wild plants. The report states the garden possesses an individuality of its own, and in it are to be recognised forms that the visitors had only met with occasionally in their country rambles, or that they scanned with half-hearted interest in various herbariums. It was observed that the Hollinwood botanists had begun a good piece of work in arranging their plants according to the natural system, in separate beds.

FLORAL FETE AT ABERDEEN.—A floral fete was held in Duthie Park, Aberdeen, on the 6th inst. Since last year the Northern Horticultural Association disagreed as to the propriety of introducing cavalry sports as an adjunct of the flower show annually held under their auspices, with the result that two shows are being held this year. The floral and fruit exhibits were shown yesterday in two large marquees. The principal exhibitors were Messrs. Cocker, whose stand was covered with specimens of herbaceous plants; Messrs. Ben Reid & Co., Mr. J. Dalgarno, Damside Cottage; Mr. Blake, Cults; and Mr. Harper, of the Duthie Park. The judges in the floral department were Mr. Mackie, gardener, Rosehagh, Inverness; Mr. Fairgrieve, gardener, Dunkeld; Mr. Whitten, gardener, Glamis Castle; and Mr. Fulton, gardener, Balmedie.

SCIENCE IN A SURPLICE.—Under this heading, the *Morning Leader* gives a notice of a flower sermon—address, rather—delivered at the invitation of the Vicar of a church in Ipswich, by Dr. J. E. TAYLOR, the well-known Curator of the museum in that city. In the case of Dr. TAYLOR, we may be sure that accuracy was not sacrificed for sentiment. Dr. TAYLOR reminded his audience that 400 years ago the Bible was not accessible to the common people, who then derived much of their religious teaching from the flowers of the field. We remember to have heard one of the best popular lectures we ever heard in the parish church at Folkestone. It was delivered from the pulpit by the Vicar, at the close of the evening service. The subject on that occasion was the structure of the eye.

FURCRAEA ALIAS FOURCROYA.—In the August number of the *Botanical Magazine*, Mr. J. G. BAKER gives the following account of the genus

FIG. 32.—BUDDLEIA COLVILLEI: FLOWERS, PALE PURPLE; CALYX, PURPLE-BROWN. (HORT. GUMBLETON) (SEE P. 186)

Furcraea:—"These Furcraeas have excited a great deal of attention lately as fibre-yielding plants. It is quite evident that the species which is best worth cultivating for economic purposes is *F. gigantea* (*Botanical Magazine*, tab. 2250). In the present plant (*F. pubescens*) the leaves are much shorter, and the texture is not nearly so firm. One great difficulty in describing and ascertaining the limits of the species, arises from their putting on such a different character when they are cultivated in English conservatories, and when they are grown in the open, either in their native home in America, or in gardens on the shores of the Mediterranean. Last November and December I paid a visit to the Riviera to study in their full development the species which are grown in Mr. THOMAS HANSBURY'S garden at La Mortola, in the Jardin d'Acclimatation at Hyères, and in the other gardens in that region. A full report on this subject will be found in the number for January, 1892, of the *Kew Bulletin*."

PRESENTATION TO MR. W. SWAN.—On Saturday, August 6, a time-piece in an elaborately-worked Walnut case, was presented to Mr. W. SWAN, gardener at Castle Hill, Englefield Green, by the men employed in the garden, as a token of respect and esteem, on his retiring from the charge of the gardens. Mr. SWAN has lately been appointed gardener to J. P. BRYCE, Esq., Bystock, Exmouth, Devon, to which place he immediately removes.

BEDDING AT KEW.—Pelargonium King of the Bedders, as seen at Kew recently, seems to be a formidable rival to Henry Jacoby, the flowers being of a brighter hue. A bed of this edged with a white-flowering Viola (probably Snowflake), forms an effective arrangement.

BEDDING IN PARK LANE, HYDE PARK.—Some fine beds planted in the mixed style are now very effective, and Mr. W. BROWNE, the Park Superintendent, is to be congratulated on the success that has been achieved in this direction. For instance, a bed of Fuchsias, mixed amongst which are flowering Petunias, produces a beautiful effect. Another bed of Heliotrope President Garfield, plants some 4 to 5 feet high, associated with Carnations and other flowers, forms a tasteful arrangement. Fuchsias planted out in groups of three quite deserve a note. The plants are flowering well, evidently being quite at home. The varieties are Mrs. Rundell, Mrs. Marshall, and Miss Lucy Finnis. Clematises, too, planted out, are doing and flowering well. Fuchsias Meteor and Cloth of Gold are effectively employed as edging plants in several of the beds. Speaking of edging plants, it is worth noting that Viola Snowflake is doing well; and amongst the Lobelias employed for the same purpose may be mentioned Emperor William, Earl of Beaconsfield, and Blue King. Henry Jacoby Pelargonium appears to be king amongst the scarlets. Several beds of seedling Begonias are flowering well, and as seen thus massed produced a good effect. The colours principally employed are salmons and scarlets. Evidently there is a great future before the Begonia as a bedder.

THE USE AND ABUSE OF FLOWER SHOWS

—We have so often lamented the waste of opportunity, and the loss of power, manifest in the average horticultural show, that we are glad to find someone else is of the same opinion. We take what follows from the *Agricultural Economist*:—"The annual recurrence of these horticultural exhibitions awakens in us somewhat of surprise, and almost disgust, that the splendid opportunity they afford of being something more than mere trivial frittering gatherings is not attempted. Take the average show. There are hothouse plants from the big guns of the district, then there are the impossible Dahlias and the Specimen Roses from the nurserymen, and some wishy-washy blooms in the flower-tent from amateurs. In the vegetables are abnormally perfect collections of vegetable, symmetry undeniable, place of growth a mystery, name of grower—well, nominal! In the amateur classes of vegetables, too, as well as the open classes, year after year, the same old names, and

little or no new blood. Classes literally farmed do not encourage gardening. Turning to the fruit. The 'Earl of this,' and 'Lord that,' with wealthy commoners, show the multitude glorious hothouse fruit; but, turning to the display of garden fruit by the 'hoi polloi,' what is found? Currants, Raspberries, Strawberries, perhaps Plums, baking Apples, but the eating Apples in July and August, where? This may or may not be exaggeration, but, at any rate, the interest in gardening is not omnivorous that requires Guards' bands, foolhardy balloonists, and distorted topsy-turvyists, to attract people. Yet shows need not be all dull or uninviting, if amusement is joined with instruction, nor need Jack be made a dull boy. Is it at all flattering to our directors in things horticultural, that an Englishman in July requiring an eating Apple cannot buy an English one, and must pay their weight in copper for foreign ones? It is not all climate that does this. There are English Apples that will keep, but there are few who know how to keep them. Here, then, let floral committees take one item, and give a demonstration in storing and packing. Grafting, pruning, thinning, sowing, transplanting, selecting seed, judging ripeness, all could be shown the same way without the dryness of a formal 'lecture,' a word that itself drives away many. There is no reason why these demonstrations should not go on continuously at all flower-shows, and there is less reason why they should not be as attractive as the dairying demonstrations that are so general now in our agricultural showyards. The flower show is the place *par excellence*, for instance, for vegetable and fruit growers to meet and discuss some means of overcoming the difficulty of placing their products on the market. At such a meeting, schemes of co-operative distribution might be devised, and the middleman fought with his own weapon—that of association with his fellows; whilst even the supercilious railway company might be brought to terms. To some extent the Staffordshire County Council are setting a good example. They have had a lecturer on cottage gardening and gardening for profit, traversing the country during the early part of the year, and it is to be noted that he is now visiting the flower shows, and giving his verbal instruction at these entertainments. The less of a lecture, and the more of an object-lesson the better, for grown-up folks are like children, and grasp the abstract better from the concrete. Certainly more use could be made of flower shows than is made at present. A subject for discussion at one of the *al fresco* horticultural parliaments might take the following form:—If the net return to the grower of 2 tons of Cabbages sent from Lincolnshire to Covent Garden is 11*d.*, what is the price of a Cabbage in Wellington Street, Strand?"

HORSE CHESTNUT.—Lieut.-Col. ONSLOW obliges us with a photograph of a fine Horse Chestnut, growing on the lawn at Old Alresford House, Hants, the property of W. W. BULPITT, Esq. The circumference of the branches is 234 feet, the height is estimated at 100 feet. When in full bloom the tree presents a magnificent spectacle. The tree was planted in or about 1733, by Admiral RODNEY, so that the tree is approximately 163 years old. On the lawn close by is a cannon taken from the French on the occasion of the Admiral's victory over the French Fleet in 1783.

"THE BRITISH MOSS FLORA."—The fourteenth part has been issued, and bears evidence of as much patient skill and judgment as preceding parts. Dr. BRAITHWAITE's work is indispensable to all students of Mosses. It is published by the author at 303, Clapham Road.

ROYAL COLLEGE OF SCIENCE.—Mr. J. BRETLAND FARMER, Demonstrator of Botany in the University of Oxford, has been appointed Assistant-Professor at South Kensington, in place of Dr. SCOTT, who takes charge of the Jodrell Laboratory at Kew as Honorary Keeper.

CALOCHORTI.—Mr. C. G. VAN TUBERGEN contributes to the *Garden* an interesting paper on the cultivation of these lovely bulbs. A southern

aspect, light sandy soil, and enriched with well-rotted cow-manure, are recommended. The bulbs should be planted in September, left in the ground all the winter, covered with a layer of straw or bracken. When flowering time comes, protection against rain or wind should be afforded.

AMATEURS, SMALL AND LARGE.—The amended schedule of the National Rose Society, whereby small amateurs were placed in a more favourable position, and consequently allowed a fairer chance in their competitions, has worked well, in spite of the predictions of many of the old stagers, and will probably be continued in future.

UPLAND CRESS.—Under this name, Messrs. CARTER & Co. are cultivating as a salad-plant a British wild plant, common around London, and known to hotanists as *Barbarea vulgaris*. A near ally, *B. praecox*, is used in France for a like purpose; indeed, is sometimes grown here as "American Cress."

HEBENSTREITIA COMOSA VAR. SERRATIFOLIA.—Messrs. DAMMANN, of San Giovanni a Teduccio, Italy, remind us that this plant, mentioned at p. 34 of the present volume, was introduced by them in 1889, in which year it was announced in their catalogue.

GARDENERS' RELIEF FUND.—The Torquay Rose-days were again a success this year, being held in very fine weather at Messrs. CURTIS, SANFORD & Co.'s Devon Rosery Nursery, on June 29 and 30; they realised the sum of nearly £50 on behalf of the local Gardeners' Relief Fund. The late show was the fifth held on behalf of this Fund, for giving temporary relief to gardeners and their widows in times of sickness or distress; and since 1888 there has been a total amount collected by the means of these Rose-days of £270, and nearly £200 has been distributed locally by the committee in aid of gardeners in ill-health or who are unable to work, and to the widows of gardeners, affording temporary relief at a time when a little help is useful.

BOEHMERIA NIVEA.—The British Consul at Cadiz, reporting to the Foreign Office on the trade and commerce of the district for 1891, refers to some land that has been secured by the Ramie Syndicate situated on the island Amalia, some 20 miles down the River Guadalquivir. He says a year ago some 15 acres of land were planted with *Boehmeria nivea*, and at the present moment 85 acres more are undergoing plantation. It is stated that the company has been formed in London with the object of testing the capability of the soil on the island for the cultivation of this plant, and if it proves successful that a large company will be formed, and several thousands of acres purchased for carrying on the plantation on a large scale. It is stated that to all appearances the plant grows splendidly, and as it is supposed that the difficulty in decortication has at last been solved, it is quite possible that at no distant date Ramie may be grown largely all along the banks of the Guadalquivir, where it is easy of irrigation.

GRAFTING.—In the *Comptes Rendus* for May 30, we find a paper by M. LUCIEN DANIEL on the grafting of Crucifers. In a previous communication the author had shown how readily root-grafting might be accomplished in herbaceous plants, whatever the nature of the tissues brought into contact, provided always that they were living. Pursuing his researches, he endeavoured to ascertain by direct experiment, what would happen if vigorous scions were implanted on feeble stocks, and *vice versa*, annual plants upon perennial plants, plants flowering at one season on those blooming at another. He thus sums up the results of his experiments:—1st. In certain Crucifers the graft influences the stock either by imparting to it some of its own vigour, if this graft belongs to a stronger species than the stock, as Cabbage on Alliaria, or on the contrary, by impeding the normal development if the graft is taken from a less vigorous species than the stock. (Alliaria, Wallflower, Alyssum, *Barbarea intermedia*, Brassica, Cheiranthus on Cabbage.)

2nd. In grafting one perennial Crucifer upon another, or upon a biennial, in the first or second year of its development, the fruiting time of the graft does not appear to be modified. This is also the case with a biennial Crucifer in the second year of its growth when grafted on a Crucifer perennial, or otherwise. 3rd. Flowering branches when commencing growth can be very easily grafted on roots. 4th. It is easy to graft successfully roots bearing tufts of leaves on stems which serve as the stock; thus grafting the descending system (root) on the ascending system (stem).

GARDENING IN HOMER'S EPICS.—We quote the following passage from Miss CLERKE's recently-published and highly-interesting *Familiar Studies in Homer*:—"The slenderness of HOMER's acquaintance with the finer kinds of bloom introduced gradually from the East is apparent from his semi-ignorance of their ravishing perfumes, no less than from the inadequacy of his hints as to their beauty of form and colour. His love of flowers was in the instinctive stage; it had not come to the maturity of self-consciousness. They obtained recognition from him neither as symbols of feeling nor as accessories to enjoyment. NAUSICAA wove no garlands; the cultivation of flowers in the gardens of ALCEUS is left doubtful; LAERTES pruned his Pear trees and dug round his Vines, but reared for his solace not so much as a Poppy. No display of living jewellery aided the seductions of CIRCE's island; CALYPSO was content to plant the unpretending Violet; APHRODITE herself was without a floral badge. Floral decorations of every kind were equally unthought of. Flowers, in fact, had not yet been brought within the sphere of human sentiment; they had not yet acquired significance as emblems of human passion; they had not yet been made partners with humanity in the sorrows of death, and the transient pleasures of a troubled and ephemeral existence."

GODMANCHESTER HORTICULTURAL SOCIETY.—The annual show was held on Bank Holiday, in the Corpus Christi grounds. In the open classes, several excellent groups of plants, arranged for effect, were set up, that from the Earl of SANDWICH (gr., Mr. MYERS) being 1st; H. GILLIATT, Esq. (gr., Mr. STEVENS), being a good 2nd. The table decorations were very pretty, and the competition very keen. Grapes might have been more extensively used in their arrangement. Some pretty baskets of flowers were shown, but the hand-bouquets were too closely arranged. Good collections of vegetables and fruit were exhibited. In the cottagers' and amateurs' classes the exhibits of hardy fruits and vegetables were good in number, and of excellent quality. Prizes were awarded for the best specimens of window gardening; and marked improvement has taken place in the windows of many in the neighbourhood since the introduction of these classes. Aquatic sports were held in the River Ouse adjoining the show grounds, which in the evening were illuminated, and dancing was kept up with spirit and evident enjoyment. A grand display of fireworks and a torchlight procession wound up the day.

ANNUAL EXCURSION.—Messrs. W. FELL & Co., Royal Seed and Nursery Establishment, Hexham, gave their *employés*—over seventy in number—their annual excursion on Thursday last. The excursion was made to Sunderland and Roker.

PLANT PORTRAITS.

AZALEA INDICA GERMAINE FYNABERT, Revue de l'Horticulture Belge, August.

BOMAREA FRONDEA, Bot. Mag., t. 7247.—A species originally described in these columns, vol. xvi., p. 669, fig. 102.

CAPPARIS FLEXUOSA, Bot. Mag., t. 7248.—A somewhat scandent plant with opposite shortly-stalked lanceolate glabrous leaves, and many-flowered corymbs on long naked stalks. The flowers are remarkable for their fragrance and for their long prominent purple stamens. Native of Brazil—Kew.

HOME CORRESPONDENCE.

SHRUB GROWTH—Whatever may have failed to grow satisfactorily during the past season, it is certain that trees and shrubs have shown no tardiness in their development. All soils seem to have given to them their quota of nourishment. Among newly-planted shrubs (those of the past season) the growth has been much better than usual. It is often stated that there is little good received from mulching trees and shrubs. We do not know any plant which is not benefited by a proper application of good wholesome surface dressing. There are methods of applying nutriment which is positively unchievous, such as foul manure fresh from farm-yard, kennel, or slaughter-house. It is not gross nourishment that is necessary, but such as will avert drought, and maintain an even supply of healthy moisture, and when the roots grow upward they will run through it rapidly. When soil is poor and inert, it is very desirable to place some healthy and rather light soil among the freshly-planted roots. Some years ago I had to plant a shrubbery over a solid rocky surface with scarcely a particle of soil over the solid bottom. The latter was broken up (with difficulty), a layer of soil spread over, and the plants placed at suitable distances thereon. Soil, in which were a variety of mixtures, was placed nicely among the roots, a good soaking of water was administered, then a mulching of rotted manure, leaf-mould, and the whole covered with road scrapings and any soil come-at-able. Every plant seemed at home and made excellent growth. The whole mass of soil became matted with roots. Last season we planted another space similar to the above, and the trees and shrubs are now in as good order as we could desire. Cupressus, R-tinosporas, Portuzal Laurels, Myrtle-leaved Laurels, Aucubas, and Hollies form the bulk of them, and average 3 to 7 feet high. *A Scot.*

ROSE-BUDDING WITH A GROWING BUD.—Apropos of budding, in the previous number of the *Gardeners' Chronicle*, some persons may like to know how budding is performed with a bud just about to push. This operation is carried out under glass, from the end of the month of May to the end of the month following, and the shoot that is so budded is shortened back to about 3 or 4 inches above the bud, when it is seen that the latter has begun to grow, an operation which is soon followed by stronger growth. One lateral shoot is allowed to grow on the part that has been cut back, and when this grows as strong as the shooting-bud, it is itself cut back half an inch or more. All other growths on the stock are broken off as soon as they appear. So soon as the bud is sufficiently developed, and has begun to form laterals, the shoot that carries it must be cut back close to the bud, and the wound dressed with grafting-wax. *A.*

POTATO DISEASE AND SORTS OF POTATOS.—This scourge has already made its appearance in this district, as on going through the village here this morning I saw the effects of it in its worst form, for in one of the cottager's gardens the leaves were so badly attacked, that large breadths of the Potatos were almost defoliated, and spots or other symptoms of its presence were only too visible over the whole. As its visitation is so early (July 19), and Potatos, like all other crops, so late, it is to be feared that this will be a very bad year for them, as the tubers are small, and even the early kinds are not fully grown as yet, so that lifting will be quite out of the question. What the so-called remedies will do for us remains to be seen, but up to the present they appear almost failures, and one can hardly expect that spraying will be effectual, as it seems impossible to wet the under-sides of the leaves, where the spores of the *Peronospora* are [No. Ed.], and the arsenical or copper solutions only kill where they touch. If we ever do stay or get rid of the Potato disease, it will, I think, be by growing and raising such kinds as are known to have resisting powers against it, and they are those with thick hard foliage and comparatively woody stems, as contrasted with the American sorts, which are always the first to show it and spread it among others. I regard their introduction as an evil, for though of handsome shape, flat-eyed, and good yielders, few, if any of them, possess flavour or quality equal to that of some of our own. Magnum Bonum, like a certain pen, has been a "boon and a blessing." It is more largely cultivated than any other, and, taking it all in all, is unequalled by any other extant. For high flavour and general mealiness, none with which I am acquainted surpass the

old Victoria, or, among the kidney varieties, the Huntingdon, which are not half so much cultivated as their merits deserve. What has become of the good old Fluke, that used to be such a favourite, and so largely grown many years ago, especially in the West of England, where it was then the cottager's mainstay, and the Lipstone Kidney, which was also a favourite? Both were handsome and good, and the Fluke was supposed to resist the disease better than any other, but it only did really well in very good soil. It did not suit our light land, as I tried it here, and had to give it up. In the garden we only grow three kinds, and they are Myatt's Ashleaf, Covent Garden Perfection, and Huntingdon Kidney; those for the later supply, the Magnum Bonums being planted in fields, where we have about 12 acres now looking well. *J. Sheppard, Woolverstone Park.*

"HAPPY-GO-LUCKY" GARDENING sometimes produces results which care, fore-thought, and intelligence only with difficulty achieve. There lived not long since in East Anglia a retired inn-keeper who had, on his retirement, bought with a house to live in, a garden for his amusement and profit, for he was a money-making man, who, although he enjoyed life, yet seemed to find nothing enjoyable that had not a money-making tendency, and although retiring from inn-keeping he by no means intended entirely to abandon this pursuit. He had a little grey pony, and used on fine days to take drives about the country buying Cucumbers, Grapes, and any choice fruit or vegetables which he thought by selling again he could gain a few shillings by; these he used, with the aid of a boy and a barrow, to hawk around the little town on the outskirts of which he lived, he himself carrying the samples to the doors of his customers. This man knew almost nothing of the practical part of gardening, and asked advice of everyone he thought competent to give it. He planted the garden with pyramid fruit trees, so far as my memory serves, about 6 feet apart, and as he had plentifully manured the ground, which was naturally good and in a well-sheltered position near the top of a moderate elevation, the trees grew with wonderful health and vigour. Often as he walked up and down the rows it seemed to me that he never did so during summer without snipping off young growths, whenever there were any to snip, very close to their base, so that the trees presented a very stumpy and peculiar appearance; yet they bore, during the two or three years that I knew them, heavy crops of fine fruit. It was really trying to see good results following these clumsy methods. I can only suppose that the conditions of soil, position, and treatment combined were the causes of success. Firstly, good soil and suitable situation; secondly, summer pruning carried to what is usually considered great excess; thirdly, heavy manuring; fourthly, deep digging close to the trees resulting in a sort of annual general smash up of most of the roots. Of course, either the heavy manuring, or that kind of pruning, or the smashing of the roots by themselves would have ruined all chances of continued fruitfulness. It was all the three combined, together with a good situation, which produced success. As the branches and the leaf surface of the trees were not allowed to extend, deep tap roots were an impossibility, for roots cannot extend much without coincident extension of the branches and leaves. I imagine, therefore, that the trees were almost entirely supported by fibrous roots annually renewed in rich surface soil. It is now more than seven years since I saw these trees, and I greatly regret that I had no opportunity to critically examine them at different seasons of the year, as a careful examination at different seasons could not fail to have been instructive. It would be interesting to know if any other of your correspondents have ever known fruit to be grown in the way I have described; if so, some books on fruit cultivation might possibly with advantage be re-written in a few words, somewhat as follows—as regards Apples, Pears, Plums, and Cherries, at least:—"Obtain your trees of bush or pyramid form, and as symmetrical in shape as possible; plant them on well-drained and highly manured soil, which need not be more than 1 foot deep, about 6 feet apart, in a sheltered situation. As soon as any new growths have become 6 or 8 inches long, snip them off within two or three eyes of their base, and continue to do this all through the growing season. As soon as the leaves have fallen in autumn, dig in a copious supply of rich stable or farm-yard manure, dig it in deeply between the trees as well as close up to their stems; never mind breaking the roots, as this is advantageous rather than otherwise; keep a most rigorous

look-out for weeds, and destroy them immediately they are detected." No other direction would be necessary, but to gather the fruit when ready, and deal with it as "circumstances render advisable." Of course, I believe to a great extent in orthodox methods, yet it is interesting to notice how heterodoxy sometimes pays, and I am sure orthodoxy may often pick up valuable hints from it. *J. E. Ewing, Havant.*

TWO GOOD PEAS—This year, when Peas are filling but poorly, it may be of service to mention those which are filling best. Two are conspicuous in this neighbourhood as being nearly all that can be desired. They are Champion of England and Veitch's Gladiator. The latter bids fair to be a very popular Pea in the kitchen, if not on the exhibition table (by no means the best criterion of a Pea, or indeed of any other vegetable). It is moderate in height, has good constitution, prolific in pods, which are well filled, and it is of excellent flavour. *P., Nottingham.*

SHORTIA GALACIFOLIA.—At p. 111, I note an enquiry from "A T." respecting the cultivation of the above beautiful and interesting plant. Broadly speaking, it presents but few, if any, difficulties to the cultivator. The general belief, however, is that it should be planted in peat in a moist and shady position, and, though it undoubtedly thrives under these conditions, to plant it in such means to rob it to a great extent of one of its greatest charms, namely, the deep bronzy-crimson hue of its foliage in autumn and winter, for it cannot be too widely known that as a handsome foliage-plant, especially in winter-gardening, it is not surpassed by another alpine. Moisture at the root it certainly enjoys, though this is not perhaps absolutely essential; but beyond this, plant it in an exposed position by all means, where the sun may have the effect of enhancing that brilliant hue, which alone makes it an acquisition. With regard to soil, it may be planted either in peat and loam in equal parts, or in sandy loam; indeed, in this particular, it appears quite accommodating. As a decorative foliage plant, then, it is very attractive, while as a flowering plant it is one of the most beautiful alpine we possess. The flowers are white, shaded with a bluish tint, and passing to rose with age. The plant is dwarf, with a creeping rootstock, and quite hardy; altogether one of the most meritorious of alpine plants, and as such, should be encouraged in every possible way. *J.*

CYRANTHUS TUCKII (*Gardeners' Chronicle*, p. 155).—I have only to say that, in common with the whole genus, it is one of the easiest to cultivate of all bulbous plants. I have thirteen species, besides one which will probably be new, and several hybrids, and I find that all belonging to the same section as *C. Tuckii* thrive admirably on a shelf near the glass in an ordinary cold greenhouse in which a *Maréchal Niel* Rose is growing on the roof. Most of the species soon fill their pots with bulbs, which flower at all sorts of seasons—indeed, they are never out of bloom for any length of time. The main points to observe are, not to disturb them at the roots, but as seldom as possible, and to keep them well watered when growing; and with less water, but not dry, when their shabby leaves indicate that they are at their less active season. *C. Tuckii*, the beautiful *C. MacOanii*, the stately *C. Huttoni*, and a few others from the higher ranges, I believe to be, like *Anoanthus breviflorus*, quite hardy in favourable situations. *J. O'Brien.*

RASPBERRY SUPERLATIVE—In answer to G. W. Richards on p. 136 the Superlative Raspberry can be had from Mr. G. Banyard, the Old Nurseries, Maidstone, who sent it out a few years ago. It is large, has fine flavour, and is a good cropper. I have discarded all the other sorts, and have now only the above variety. I plant the rows 12 feet apart, and plant Potatos or any dwarf vegetable between. Stake wide, say 2 feet at bottom; leave the stake so that the top shall be at least 6 feet apart, to allow the young canes plenty of room to ripen themselves, and the fruit on the autumn growths. Mulch well, and not dig too close. *F. Bridger, Penshurst Gardens.*

SUMMER TRANSPLANTING OF EVERGREENS.—Some evergreens are very difficult to move successfully, whilst others are just as easy, but if the first-mentioned are lifted at the right time, the operation may be done with comparative safety if the plants have not far to travel, or are not kept long out of the ground. In gardens where they are only to be shifted short distances, and may therefore be got in

again quickly, I should not hesitate to transplant any evergreen now, provided its young growth was not too soft, as the ground being so warm, and plant-life active, roots are formed at a rapid rate, and plants soon recover the check. To aid them in this, however, and prevent undue suffering through dryness of air, the tops should be frequently syringed during the day for the first week or two, as that will counteract any loss of sap, and keep the bark from shrivelling. Among the easiest to move now are Rhododendrons, Box, Hollies, Aucubas, and most of the Conifers, but, of course, a good deal depends on the soil they are in, and how long they have stood without being disturbed, or whether previously transplanted, as where conditions are favourable, they will lift with good roots and large balls of earth, and scarcely feel the change. The way to insure success, is first to dig and prepare large holes where the plants are to go, and then set about lifting them, going well out, and opening a deep trench at a fair distance from the stem, and then working up gradually nearer, by carefully forking the soil out from the roots, till the mass of earth is so reduced that the bulk may be hoisted and carried with what appliances or strength there may be at command. As soon as the plant is placed in position, the next thing is to put some fine soil around the outside of the ball, and then by dashing water with great force, wash it into any cavities there may be, and to make sure of this being done, the plant should be swayed to and fro, when the water and soil will draw under, and in and amongst the roots, and settle down, after which the hole may be filled, and a good mulching given, to which latter I attach much importance. *J. Sheppard.*

CHILDRENS' EXHIBITS AT FLOWER SHOWS.—To every adult exhibitor, assuming that he or she has higher aspirations than the mere winning of prizes, every good exhibit at a show should furnish an object lesson, inducing better cultivation in the future, that the perfection thus presented might be arrived at in each exhibitor's case. It can hardly be so with respect to children's exhibits, except where they consist of pot plants. But usually children are confined to such, comparatively, useless things as wild-flower bouquets or bunches, by courtesy termed nosegays, also big bunches of grasses, put together with little taste, and without sense or reason. Such exhibits have no good results, and in no way educate the youthful exhibitors. I saw but last week, at Highgate, a most pleasing way of showing wild grasses which had, at least, some educational value, and might, under proper guidance, be made much more so. Elementary school teachers have, it is feared, very little botanical knowledge, and are very ignorant even of such ordinary knowledge as the common names of wild flowers and grasses. There are a few exceptions, but they are few indeed. Were the few the rule, exhibits of the nature to which we refer might be found in every rural flower show in the kingdom. At Highgate, native grasses were shown in small bunches secured to boards covered with some pink-coloured calico. In one case sixty varieties were furnished, in others fifty-two, forty, and one hundred. None had their botanical appellations furnished, and hardly one-fifth their common names. These were somewhat odd ones, Oat, Egg, Pussy Cat, Foxtail, Shiver, Lady Hair, Red Maiden Hair, Tinker-tailor, Barley, Brush, &c., sufficient perhaps for the exhibitors, but not instructive. Such a class, were it universally established, might prove, with some aid from elementary school-teachers, a most useful one at shows, as also would the one for bunches of wild flowers, correctly named, rather than the meaningless bunches now seen in useless profusion. *A. D.*

PRUNING PEACH TREES.—Undoubtedly the best time to prune Peach trees is directly the fruit is gathered, whether the trees be growing in the house or against the open wall. Some persons would not think of pruning their trees until the time comes for cleansing and re-arranging the branches for the next year's growth. I would ask these persons what is the advantage to be gained by leaving this necessary operation until the time named. A little thought when gathering the fruit should convince them that there is much to be gained by cutting out useless branches or shoots at once, as it will afford more space to those left, and will admit of a more thorough maturation of the shoots, and it is very often traceable to a want of maturation of the last year's shoots that thin crops of fruit are so common in some neighbourhoods out-of-doors. I do not mean to say that the trees can be so pruned at this period that not a single shoot will need to be cut

out in the spring, but the bulk of it can be done now, and ought to be if the best results are to be obtained. With outside trees this summer-pruning applies with more force, because there is not the advantage of having the fruit ripened with the aid of glass, which brings the wood to a greater state of maturity than when growing against a west wall for instance, this latter being perhaps the worst position of all for Peaches. As previously hinted, the pruning consists of removing useless branches for next year's crop, where an old weakly branch can be cut out to make room for shoots of the current year, which are of medium strength, and promise to mature readily. By following this plan, the trees are always furnished with wood for an annual crop of fruit, the form of the tree from base to its extremity is preserved also, and it is as well to have shapely trees as otherwise. The point to observe is to allow space for every shoot, that it may become matured; this is the best guide to follow in pruning Peach trees. *E. M.*

RHODODENDRON FALCONERI.—The interest attaching to the various letters on the flowering of this grand species is heightened by an apparent uncertainty as to its real colour. The gentleman who describes it as shaded lilac is, I think, mistaking R. Hodgsoni for R. Falconeri; they are very easily mistaken for each other when not in bloom, and his description seems to suggest that this has been the case now. R. Falconeri flowered (I believe for the first time in Europe) under my care at Bagshot (Standish & Noble) about the year 1854 or 1855. Its colour was a rich primrose or deep sulphur, very clear and beautiful, with a dark spot at the base of each segment, which I can only liken in shade to the rich blotch at the base of each petal of the Gum Cistus. Probably most readers of the *Gardeners' Chronicle* have seen and admired this striking flower, and will recognise that my R. Falconeri did not at all resemble the one described in p. 137 of that paper by the editor. So many of us, however, are told by our lady friends that we are afflicted with colour-blindness, that this malady may account for the discrepancy in my description of the colour of Falconeri; I can only say it appeared to be yellow and not lilac. It is a magnificent shrub, worthy of all praise, and in 1851 or 1855 was considered of so much importance that we had it modelled in wax, and presented to the Royal Botanic Garden, Regent's Park, in whose museum it remained many years, but I am ignorant what has become of it finally. *Charles Noble, Bagshot.*

PEAR JARGONELLE.—In Mrs. Turner's garden at North Ferriby, near Brough, Yorks, I recently observed a fine old tree of the above variety. From the information I could gather, it is something like 104 years old. Trained to the wall of a huge building, the branches covered a space of from 40 to 60 feet wide, and 30 or more feet high. I was informed by Mr. Belwood, Mrs. Turner's gardener, that the tree annually bears heavy crops of fruit. The stem at 3 feet from the ground-level measures 5 feet. A tree of these dimensions, it is needless to say, rarely makes but little wood, but when a few shoots can be obtained, Mr. Belwood takes care to have them nailed to the wall. There are possibly other trees of the above variety of larger dimensions, but even if that be so, this one is well deserving notice. *H. Markham.*

POISON IVY (RHUS RADICANS).—In the *Gardeners' Chronicle*, p. 105, this plant is mentioned as a favourite of Professor Sargent's, and as its beauty in its autumnal dress is undeniable, and likely to attract plant-lovers to buy and cultivate it, I think it may be useful to call attention to its venomous character. It may not be generally known, but it is nevertheless a fact, that the mere touch or rub against *Rhus radicans* is sufficient to cause intense suffering. I have a case before me as I write. A man was engaged in layering, and did not know (nor did I) the poisonous character of this shrub; he proceeded with his work, feeling no pain, and receiving no wound or even abrasion of the skin; yet the next day his hands and arms were covered with large blisters and pustules, and swollen to double their normal size, and he is quite unable to use them, or do any work at all. I could scarcely have believed this if I had not seen it, and feeling that the penalty attached to the enjoyment of that feast to the eyes which *Rhus radicans* offers is too great, I have rooted up and burned every vestige of this beautiful but malignant plant. *Charles Noble, Bagshot.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 9.—The exhibits at the Drill Hall on the 9th inst. were interesting but not numerous, and this was the more noticeable when contrasted with the really fine show of July 26 last.

Floral Committee.

Present: W. Marshall, Esq., in the chair; Messrs. R. Dean, H. Herbet, H. B. May, R. B. Lowe, W. C. Leach, Chas. Pearson, Geo. Phippen, Jas. Walker, J. T. Bennett-Poe, T. Baines, Henry Cannell, Robert Owen, B. Wynne, Harry Turner, Geo. Paul, T. W. Girdlestone, and Geo. Gordon.

Messrs. Cannell & Sons, Swanley, Kent, exhibited some beautiful double Begonias, set up in bunches of three; R. B. Parsons (pink), Miss Falconer (yellow), and Madame la Baronne de St. Didier, were perhaps the best. The latter is a very lovely variety, of a pale lemon-yellow. Also two Cactus Dahlias, Robert Cannell, a good flower with colour resembling Chinaman, and Favourite, a very deep bronze. Mrs. Keith, a decorative variety of curious shades of bronze and pink, was granted an Award of Merit.

Mr. Cannell had also *Stapelia hirsuta*, *S. variegata*, and *S. pinnata* in flower, besides a large collection of blooms of Carnation, embracing many varieties. (Silver Banksian Medal.) On some of the flowers the eggs of the blow-fly were visible. Mr. Cannell tells us the larvæ are hatched in that situation, but soon die.

Mr. Chas. Turner, of the Royal Nurseries, Slough, showed some cut blooms of Carnations and Picotees, Carnation King of the Scarlets, a self-coloured scarlet, and Salamander, a self-coloured rose; received Award of Merit. Also Picotee Nellie Bath, yellow ground, flaked dark crimson; Duchess of Sutherland, white ground, flaked with rose; Mrs. Arthur Barrett, yellow ground, rose-flaked; and Old Coin, a very curious flower, yellow and rose.

Mr. Leach, gr. to the Duke of Northumberland, Albury Park, had a collection of cut flowers of Stocks and Zinnias; also some fine Mignonette, Her Majesty.

From the Royal Horticultural Society's garden at Chiswick came a fine collection of Sweet Peas, showing beautiful colour, and shades from pure white to rich scarlet and deep purple.

Mr. F. Bull, Wormingsford, Colchester, sent twelve seedling Carnation blooms. Mr. Richard Dean, Ealing, exhibited two border Carnations, The Speaker, a deep purple, and Lord Randolph Churchill, a good scarlet. Also a very good Carnation, called Ketton Rose, and Antirrhinums Brilliant and George Findlay, the latter obtaining an Award of Merit. Mr. Dean also included cut blossoms of a Sweet Pea called Delicata, and a plant of *Sempervivum Boissieri*.

Messrs. Paul & Son, Old Nurseries, Cheshunt, had some Rose blooms. T. B. Haywood, H.P., a crimson-rose colour; Mrs. J. D. Pawle, H.P., dark crimson; Gustave regis, N., pretty little yellow bloom; and their new Tea Waban. Mr. Anthony Waterer, Knap Hill Nurseries, Woking, had a spike of *Lilium Parkmanni* ×, very like *L. auratum*, but much less campanulate.

H. Warburton, Esq., Claverhouse, Ascot, showed a single yellow Begonia, called Ethel Louise; and Mr. G. Clarke, Maison Dieu Nurseries, Dover, had a variety of Sweet Pea. Mr. Edmund Holman, Bishop's Waltham, showed some blooms of a double-Begonia seedling; the flowers were scarlet, with a good white centre.

From Mr. P. McArthur, of Maida Vale, came a plant shown under the name *Aloe Gortonia*. This is a very pretty Aloe, with green leaves, finely toothed and speckled with white. The plant was carrying a spike of bloom about 2 feet high.

Mr. A. Spurling, Blackheath, obtained an Award of Merit for a very fine yellow Carnation called The Moucher, of excellent habit.

Messrs. Jas. Veitch & Son, Chelsea, had cut sprays of *Robinia Pseudo-Acacia semperflorens*, *Eucryphia pinnatifolia*, a very fine hardy shrub, bearing white single flowers, containing numerous white stamens with yellow anthers; and of *Pavia macrostachya*, another very ornamental flowering shrub, both of which have been figured in our columns. Also a collection of their celebrated hybrid *Streptocarpuses*, and of hybrid forms of *Rhododendron javanicum-jasminiflorum*. A plant of *Vallota purpurea* var. *ambilis* also came from Chelsea, bearing a good strong scape of bluish-white flowers. (Silver Banksian Medal.)

Mr. Wytbes, gr. to the Duke of Northumberland,

Syon House, Brentford, contributed a magnificent group of *Campanula pyramidalis* in variety. *C. pyramidalis compacta*, a dwarf little plant with blue Anemone-like flowers, was granted an Award of Merit, Silver Banksian Medal.

Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham, received a Silver Banksian Medal for a very fine lot of Carnations; and Mr. T. Jannock, Dersingham, King's Lynn, showed some bunches of Lily of the Valley, and received a Cultural Commendation.

The very interesting collection of Sweet Peas which Mr. Barron brought up from the Chiswick Gardens must convince all that good work is being done at Chiswick, when such a fine collection of Sweet Peas can be presented to view in such fine character. Of bronze-shaded varieties, as representing the darkest-coloured, Boratton takes the lead; the standards are of a rich bright bronzy-maroon, the wings bright purple—a fine and distinct variety. Indigo King is another fine dark variety; glistening maroon standards, and rich purple wings—very fine. Imperial Blue is one of the striking blue varieties Mr. Eckford has raised; it has pale bluish-purple standards and bright blue wings. Waverley is another blue, but of a very pleasing pale colour; the standards rosy-violet, with pale violet wings. Dorothy Tennant, a beautiful variety, finds a place also among the blue Sweet Peas, though the tint is violet rather than blue; the standards are clear bright rosy-violet, and it is one of the most distinct and attractive varieties Mr. Eckford has raised. Countess of Radnor has delicate soft mauve standards and bluish-mauve wings, also very pretty and attractive. Princess of Wales is striped with blue and rosy-violet on a white ground, though striped Sweet Peas are not so attractive as the more definite self-coloured varieties.

Of crimson or red shades the darkest is Cardinal, with its bright red standards and lively rosy-violet wings. Jeannie Lea has pale red standards and pale wings of rosy-violet, of the same character as the preceding, but paler in all its parts. One of the most useful and pleasing of the Sweet Peas raised by Mr. Eckford is Splendour, and well named, too, because of its bright rose; but to be appreciated, it should be seen growing in a mass. The nearest approach to a scarlet is found in Ignea, with its deep bright red standards and bright deep rosy-violet wings. Her Majesty is paler in hue than Splendour, the standards bright pinkish-rose, with a dash of violet; very pretty. Orange Prince has orange-salmon standards and clear pink wings, the orange being taken as a promise of a deeper tint of this colour in successive varieties. Empress of India is also a very pretty variety, the standards salmon-pink, the blush wings having slight veins of pale violet. The Queen has salmon-pink standards, with wings of the palest soft mauve; a striped form of this was also shown. Apple Blossom has pale rose standards, with blush wings, soft and delicate; and it is equalled in attractiveness by Mrs. Gladstone, with its delicate pink standards and blush wings. The Bride and Queen of England are two white varieties, the last, to all appearance the largest, but both having a close resemblance to Mrs. Sankey, which appears to be the largest and purest white variety. Delight has pale yellow or straw-coloured standards, and white wings. Lemon Queen has lemon-pink standards and blush wings, very distinct and attractive. Primrose and Mrs. Eckford were both shown, with a decided family likeness between them, but it may be concluded the latter has a slight gain in depth of colour, the yellow being stronger, and not quite so fleeting.

We do not cultivate Sweet Peas as we ought; the old plan of sowing thickly in rows is still followed, the individual plants having little scope for development. The effect of good cultivation upon Sweet Peas is something astounding. If they are given good soil, more space, and water and mulching in dry weather, the flower-spikes would be bolder, the individual flowers larger, and the colours deep and glowing.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; Jas. O'Brien, Sec., Dr. Maxwell T. Masters, F. Sander, E. Hill, T. W. Bond, H. Ballantine, H. M. Pollett, and W. H. White.

Messrs. F. Sander & Co., St. Albans, staged a group of rare Orchids, among which were their new *Lælia Oweniana* × (*C. pumila Dayana* ♀, *C. xanthina* ♂), a very pretty hybrid with white sepals and petals, and dark maroon front to the labellum, with a white blotch at the tip. The interior of the tube is tinged with bright yellow (Award of Merit);

also the remarkably fine *Calanthe Sanderiana*, which is of the evergreen, or *C. veratrifolia* section. Its flowers were larger than any of the genus, and bore a peculiarly thick spur. Sepals and petals bright rosy-lilac, lip dark crimson (Award of Merit). Messrs. Sanders' group also contained the true *Cypripedium Wallisii*, *C. Doris* ×, *C. doliare* ×, *C. radiosum* × Sander's var., *C. picturatum* ×, *C. Macfarlanei*, *Saccolabium Hendersonianum*, *Vanda Sanderiana*, *Bulbophyllum mandibulare*, *Cattleya granulosa*, *C. Schofieldiana*, in three distinct forms; several *C. Warscewiczii*, a pretty plant of *Odontoglossum Schroderianum*, *Oncidium tigrinum*, &c. (Silver Banksian Medal.)

M. Godefroy-Lébeuf, Rue d'Edimbourg, Paris, sent a fine plant of *Cypripedium caudatum* Luxembourg var., which is a much stronger grower than the plants of *C. caudatum* imported of late years, and without the rose-coloured tint on the flowers. (First-class Certificate.)

C. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), exhibited a fine hybrid, *Lælio-Cattleya Ingramii* (*L. pumila Dayana* ♀, *C. aurea* ♂). Although the plant was small, it bore evidence of the cross with *C. aurea*, the form of the lip being that of this species. Sepals and petals light rose; lip, dark purplish-crimson, with an obscure tracing of a lighter hue. (First-class Certificate.) Mr. Ingram also exhibited *Cypripedium Elsteadianum*, *C. conchiferum* ♀, *C. grande* ♂.

Thos. Scatter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), staged a noble plant of *Lælia crispata*, Scatter's var., with three spikes bearing together twenty flowers, which were characterised by the broad and not narrowed front lobe to the lip, which was also very richly coloured (Award of Merit). The same gentleman also exhibited *Lælia elegans Bluntii*, and cut spike of *Lælio-Cattleya Amesiana* ×.

Messrs. Charlesworth, Shuttleworth & Co., of Heaton, Bradford, and Park Road, Clapham, again exhibited their dwarf strain of *Oncidium macranthum nanum*, which produces very fine flowers, on spikes only a few inches in height, and from very small plants (Award of Merit). The same firm also sent *Bifrenaria Charlesworthii*, *Miltonia Moreliana atrovirens*, *Zygopetalum Warlesianum*, *Anguloa Turneri*, and an *Oncidium* intermediate between *O. Forbesii* and *O. curtum*.

Messrs. James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, sent *Cypripedium Astrea* × (*C. Spicerianum* × *C. Philippinense*). The plant bore a two-flowered spike. The upper sepal white, green at the base, and with a purple line up the centre; petals twisted, tinged with dull rose; lip greenish-white, with lilac tinge.

T. M. Burton, Esq., Gainsborough, sent a hybrid *Cypripedium*, which was determined to be *C. Mavardi* ×.

F. Wigan, Esq., Clare Lawn, East Sheen (gr., Mr. W. H. Young), sent *Lycaste tetragona* and the rare *Angraecum caudatum*. A. H. Smee, Esq., The Graige, Carshalton (gr., Mr. G. W. Cummins), sent a spike of *Phajos Humblotii Henryii*. Mr. McArthur, the London Nursery, Maida Vale, a form of *Cypripedium Godefroyae*, with flowers approaching in form and spotting to *C. bellatulum*, and Messrs. Hugh Low & Co. sent plants of another form of *C. Godefroyae*, with yellow-tinted flowers, spotted with purple, four fine plants of *Vanda cœrulea*, *Trichopilia rostrata*, and *Angraecum articulatum*.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., in the chair; Messrs. T. F. Rivers, W. Wilks, H. J. Pearson, Jas. Cheal, G. W. Cummins, Geo. Bunyard, J. Wright, Alex. Dean, J. W. Bates, G. H. Sage, G. Reynolds, G. Wythes, H. Balderson, and George Taber.

A grand collection of Figs came from the Society's garden at Chiswick, containing about thirty varieties. The names were *Trois Récoltes*, *Martinique*, *Gourand Noir*, *De Constantine*, *Green Ischia*, *Toulousienne*, *Gourand Rouge*, *Hirta du Japon*, large Black Duro, *De la Madelaine*, *White Ischia*, small Black, *R-culver*, *De l'Archevil*, *Black Ischia*, *Bourjassote Grise*, *Du Roi*, *Negro Largo*, *Boutard*, *Doré Nobis*, *Bourjassote Noire*, *Negroume*, *Trifer*, *Doré*, *Brunswick*, and *Grosse Violette de Bordeaux*. First-class Certificates were awarded to the following five varieties for exceptional fine flavour:—*Nebian*, *Bourjassote Grise*, rather small Ischia-like fruit; *Monaco Bianco*, *Gourand Noir*, a good-sized black fruit, shape like *Brown Turkey*; and *Violette Sapor*.

Fruits and foliage infested with the minute scale called *Mytilaspis ficus* were also shown. This insect is very detrimental to the Fig, and when it gets upon the fruit, the fruit ceases to swell.

Messrs. D. Burton & Sons, B-xley Heath, Kent, brought a very large number of Peaches and Nectarines, including about six or eight dozen of good fruits of Rivers' Orange Nectarine, and some excellent fruits of Peaches, Prince of Wales, Gladstone, and Sea Eagle. (Small Silver Medal.)

Messrs. T. Rivers & Sons, Sawbridgeworth, were awarded First-class Certificates for Cherry Emperor Francis, and for a Plum Late Transparent Gage, the Plum possessing most delicious flavour.

Mr. Wythes, gr. to the Duke of Northumberland, exhibited a green-flesh Melon, obtained from Eastnor Castle and Syon House, which seemed to take much after Eastnor Castle; also a dish of Tomato Ladybird, very fine even fruits. Mr. J. Barkham, Longford House, Newhaven, exhibited a seedling Melon, called Barkham's Seedling, obtained from High Ross hybrid, and Wm. Tillery. Another seedling Melon came from G. Scatter, Esq., Stand Hall, Whitefield, Manchester, called Stand Hall Hybrid. W. M. Bullivaot, Esq., Homewood, Eden Park, Beckenham (gr., T. Crosswell), also showed fruits of a very pretty Melon called Crosswell's Green-flesh, and a capital dish of Tomatos Sutton's Perfection. A first class Tomato called Swanson's Eclipse, was shown from the Chilwell Nurseries, Nottingham, by Messrs. J. R. Pearson & Sons. W. A. South, Esq., Neasdon House, Neasdon, N.W., also contributed seedling Tomatos.

Messrs. Sutton & Sons, Reading, showed three Marrowfat Peas, recommended for market growers and others, as they are said not to require sticks. Perfection appeared a very good dark green coloured variety, and is said to grow 3 feet high. Windsor Castle is a lighter coloured pod, but the pods are very large and well-filled. Sutton's Exhibition, however, was the best. This has been introduced this year, and the pods are large, and contain from ten to a dozen good Peas of a very dark green colour, and grows about 4 feet high. (Cultural Commendation.)

Messrs. W. W. Johnson & Sons, seed growers, Boston, also showed a good collection of Peas, containing some of the well-known kinds. We do not remember seeing a better dish of Duchess of Albany than the one exhibited by this firm. (Cultural Commendation.) Some Runner Beans, exceedingly early, came from Mr. Leach, gr. to the Duke of Northumberland, Albury Park.

LECTURE ON FUCHSIAS. BY MR. G. FRY.
